- The Oak Ridge Operations Office will consolidate financial databases and payment processes for the Financial Center of Excellence 100 percent complete.
- The Oak Ridge Operations Office will complete implementation of the Emergency Management Network, which will provide a computer data link for transfer of emergency information between the Oak Ridge area sites and the state of Tennessee.
- The Oak Ridge Operations Office will reduce costs of excessive ES&H oversight by relying more on outcome-based measures such as ES&H performance indicators, trending, and analysis. Only one major DOE oversight activity will be conducted at ORNL, and it is expected that researchers will spend less time responding to audit and appraisal findings.

FY 1997 Measurable Performance Activities:

- The Office of Field Management will implement an automated facilities inspection process at all Department sites.
- The Office of Field Management will complete Contract Reform actions and transfer the activity to the Deputy Assistant Secretary for Procurement and Assistance Management.
- The Chicago Operations Office will continue to execute the laboratory's performance-based management and operating contracts.
- The Idaho Operations Office will establish a privatized regional waste treatment center at the Idaho National Engineering Laboratory.
- The Oakland Operations Office will include cost cutting strategies in our joint strategic plans with laboratories.

FIELD OPERATIONS PROGRAM DIRECTION

III. Performance Summary: (Cont'd)

- The Oak Ridge Operations Office will complete 100 percent of the development and design of facility-specific training modules, on-the-job training guides, and facility-specific exam banks for some 50 facilities.

- The Oak Ridge Operations Office will complete implementation of the ORO Emergency Operations Network, which will provide computer links for transfer of emergency information between the seven major ORO sites and the ORO Emergency Operations Center.

IV. Explanation of Funding Changes from FY 1996 to FY 1997:

- The increase of $8,991,000 in Salary and Benefits is due to an increase in severance costs in FY 1997; the restoration of awards and overtime; the full effect of the FY 1996 locality pay increase and pay raise; the partial year effect of the FY 1997 locality pay increase and pay raise and other base salary adjustments.

- Voluntary Separation in Pay increased $355,000, and is $3,000,000 in FY 1997 and covers 75 VSIP's.

- The increase of $5,100 in travel is due to an increase in the Office of Field Management's travel requirements.

- The increase of $187,000 in other related expenses is due to inflation.

V. Explanation of Average FTE Costs:

Overview:

- The average FTE cost for this account includes expenses that support administrative costs such as rental payments for office space, administrative data processing, printing, and other services and one time expenses for severance costs in FY 1997.

- The wide variance in the average FTE cost by office, reflects the different expenses incurred by the offices in this account. - All of the offices pay the rent for FTE's at their facilities. - The Office of Field Management provides Life Cycle Asset Management for the entire Department, which includes Architecture and Engineering contracts in support of cost estimating and contracts in support of project training and accounting. - The cost of advisory and assistance services varies by office, and for the multi-purpose offices the landlord expenses differ.

V. Explanation of Average FTE Costs: (cont'd)

Chicago:

- The average FTE cost includes expenses related to salaries and benefits, travel, training, communication, utilities, printing, support services, supplies and materials and capital equipment.
- The increase of $8,625 per FTE from FY 1996 to FY 1997 reflects the locality pay and pay raise in FY 1996 and partial increase in FY 1997, severance cost, communications and other services.

Idaho:

- The average FTE cost includes expenses related to salaries and benefits, travel, training, communication, utilities, printing, support services, supplies and materials, rental payments to GSA, and capital equipment.
- The increase of $6,065 per FTE from FY 1996 to FY 1997 reflects the locality pay and pay raise in FY 1996 and partial increase in FY 1997, severance cost, and other services.

Oak Ridge:

- The average FTE cost includes expenses related to salaries and benefits, travel, training, communication, utilities, printing, support services, supplies and materials, rental payments to GSA, and capital equipment.
- The increase of $6,463 per FTE from FY 1996 to FY 1997 reflects the locality pay and pay raise in FY 1996 and partial increase in FY 1997, severance cost, and rental payments to GSA.

Oakland:

- The average FTE cost includes expenses related to salaries and benefits, travel, training, communication, utilities, printing, support services, supplies and materials, rental payments to GSA, and capital equipment.

FIELD OPERATIONS PROGRAM DIRECTION

V. Explanation of Average FTE Costs: (cont'd)

- The increase of $16,758 per FTE from FY 1996 to FY 1997 reflects the locality pay and pay raise in FY 1996 and partial increase in FY 1997, severance cost, and rental payments to GSA.

Field Management:

- The average FTE cost includes expenses related to salaries and benefits, travel, training, communication, utilities, printing, support services, supplies and materials, rental payments to GSA, capital equipment and support of the Life Cycle Asset Management and project management systems that support the entire Department.

- The increase of $16,087 per FTE from FY 1996 to FY 1997 reflects the locality pay and pay raise in FY 1996 and partial increase in FY 1997, increase in VSIP, the reinstatement of awards and overtime, and increases in the Working Capital Fund.

INFORMATION MANAGEMENT INVESTMENT PROGRAM

PROGRAM MISSION

The Information Management Investment Program supports the investment requirements of the Strategic Alignment Initiative to integrate information management within the Department. This program will fund Corporate Information Management investments. The Chief Information Officer, in conjunction with the Chief Financial Officer, will allocate information management investment funds to projects approved and prioritized by the Executive Council for Information Management.

The GOAL of the INFORMATION MANAGEMENT INVESTMENT PROGRAM :

Realize savings through consolidating information resource acquisitions, designing an information architecture for the Department and ensuring interoperability among all sites. Integrate information management systems within the Department.

The OBJECTIVE related to this goal is:

1. To fund prioritized corporate information management projects that will optimize the use of shared business systems and common data repositories, develop a system that will be able to support the Department's Corporate and local telecommunications infrastructure as opposed to having multiple systems to do the same support, and consolidate data centers through modernization of equipment and outsourcing information processing requirements to other Federal or commercial data centers. Other projects that would develop an information management infrastructure that organizes resources that support operational activities related to the generation, processing and delivery of information for the Department would be funded.

PERFORMANCE MEASURES:

Performance measure related to this program are quantitative.

1. Establish a Strategic Information Management process to align requirements with the business needs and establish a methodology for corporate information systems implementation within the Department.

2. Realize savings of $25,000,0000 in telecommunications integration and services acquisition over the next five years through acquisition streamlining and consolidation.

3. Establish an information architecture to support the Department's business line requirement and future information infrastructure.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

The Information Management Investment Program is a new program in FY 1997. It is managed by the Office of Human Resources and Administration (HR).

Total, IMIP	$ 0	$ 0	$ 0	$ 0	$ 14,900

1068

FY 1997 Funding Summary:

The FY 1997 funding of $14,900,000 includes activities in these areas:

Corporate Information Systems consolidation, development and deployment. This effort will maximize the Departments' investment in information systems by reducing duplication of effort and optimizing the use of shared business systems and common data repositories. Investments in this area could be used to develop and implement corporate systems that have clear Business Cases/Plans like Human Resources Management Information System, Financial Management Information System, and Directives.

Acquisition Streamlining/Consolidation will allow the Department to "work smarter, not harder." An example of this is the acquisition of Telecommunications Integrator Services (TELIS). The TELIS would provide a nationwide telecommunications integrator services capability by FY 1998. TELIS would be able to support the Department's corporate and local telecommunications infrastructure. The acquisition and use of this service would save approximately $60,000,000 due to consolidating requirements of more than 50 of these sites nationwide.

Information Centers Consolidation is to achieve multi-year cost savings and improve public access to information. Information Center Consolidation may be either physical (combining two locations into one) or virtual (seamless access to information from divergent locations).

Data Center Consolidation is not only part of the Strategic alignment Initiative but it is also an Office of Management and Budget (Bulletin 96-02) requirement. This bulletin calls for agencies to:

- Reduce the total number of agency data centers during the next 24 months, by closing many currently operating data centers and concentrating their operations into a smaller number of physical locations.
- Collocate small and mid-tier computing platforms in larger data centers.
- Modernize remaining data centers in order to improve the delivery of service.
- Outsource Information processing requirements to other Federal or commercial data centers were appropriate.

Information Management Infrastructure is defined as organized resources that support operational activities related to the generation, processing and delivery of information. The infrastructure includes methods and procedures, Information Architecture, trained personnel, networks and installed processing equipment. Some examples of possible Information Management Infrastructure investment at the Department could include a shared network for the library, conolidating/enhancing telecommunications and streamlining Department-wide services.

Investment fund candidates currently include:

1) Corporate Structure for Life-Cycle Management of Electronic Scientific and Technical Information.
2) Telecommunications Integrator Service (TELIS) acquisition.
3) Shared library network.
4) Information Architecture.
5) Financial Management Information System.
6) Document Online Coordination System (DOCS).
7) Human Resource Management Information System.
8) Distance Learning.

Executive Summary

The mission of the Office of Energy Efficiency and Renewable Energy is to work with our customers to lead the nation to a stronger economy, a cleaner environment, and a more secure future by developing and deploying sustainable energy technologies that meet the needs of the public and the marketplace.

Over the last two decades, the Department of Energy's energy efficiency and renewable energy -EERE- programs have produced remarkable successes for America's long-term economic growth, improved environmental quality and continued world leadership in technology. Few Federal programs have produced higher returns on the taxpayer dollar.

In 1995, an independent commission headed by energy expert Daniel Yergin confirmed that two dozen energy efficiency technologies developed with DOE funds are now "generating billions of dollars worth of annual consumer energy savings and new business opportunities, and playing an important role in job creation."

This EERE budget presents a portfolio of research activities directed at strategic national needs that will cost the public just under $1 billion this year -- but it not only addresses strategic national needs -- by the turn of the century it will have returned to the public every dollar spent and $4 billion more in energy cost savings alone. This return is the result of our R&D being particularly effective -- EERE research won nine R&D 100 awards in the 1995 International Competition "... for the most technologically significant new products." Since 1991 we have won 31 of these prestigious awards, six percent of those given in the last five years. This is more remarkable considering the EERE budget represents less than one-half of one percent of the total U.S. R&D budget.

New energy technologies are instrumental in solving complex interrelated environmental, social, and economic problems. For the government, delivering a new technology to the marketplace is a result of a series of research activities designed to test and develop good ideas that would not otherwise be undertaken by business because of the high individual risk, difficulty in capturing a return on the initial investment, complex cross-cutting nature of the effort, or public nature of the benefits are inappropriate to their necessarily near-term market focus. These research stages involve constant collaboration with customers and partners and include: concept development, market and technical feasibility studies, system and component design, research plans, research, prototype construction and testing at many stages, scale-up demonstrations, and an array of deployment activities. Collectively the stages constitute a research "pipeline" to energy product markets.

In 1997, the Office of Energy Efficiency and Renewable Energy plans over 225 R&D projects in various stages of the research pipeline. This year we expect to work with 940 major partners including consortia, laboratories, industry groups, states and retailers that will conduct R&D and help deploy EE/RE technologies to thousands of sites and users including foreign countries, 50 clean cities, all 50 states, 800 utilities, 1000 industrial partners and thousands of buildings and demonstration fleet vehicles. Those partner-customers of EERE technologies lead the deployment of energy technologies that will address the needs of the public and the marketplace.

The challenge DOE faces in FY 1997 is to produce beneficial new technologies with fewer resources, maintaining the vital contribution of energy efficiency and renewable energy in the Administration's and Congress' vision. To accomplish this goal, DOE's FY 1997 Budget Request proposes funding for programs that will leverage significant non-Federal investments and will produce high economic, environmental and energy-security benefits, while accelerating the entry of U.S. technologies into the global marketplace.

By the year 2000, the $1 billion investment contained in EERE's 1997 budget, will pay for itself five times over in the value of energy cost savings that every United States energy consumer will receive. As these savings are spent on domestic goods rather than foreign oil, billions of dollars will be added to the U.S. economy. Just as importantly the investment in EERE technologies will prevent millions of tons of air, water and ground pollution benefitting every person in the United States, particularly the 150 million people living in the 190 areas of the country with poor air quality. EERE technologies provide these benefits without a single law and renewable energy, regulation, rule or incremental cost to consumers, industry or business.

Energy Efficiency and Renewable Energy Programs Represent an Appropriate Government Role in Technology R&D

Technology development is the key driver of long term economic strength for our nation. Sustained economic expansion will result if there are steady increases in the efficiency of the production processes. Technology is the key *enabling input* because it increases the efficiency with which inputs are used, thereby enabling a country to produce more with less. The practical outcome of technologies is marketable products, which when produced with energy using technologies are more competitive in two ways. First, the products cost less to make and thus sell. Second, the energy efficiency technologies themselves cost less to operate and thus are more attractive to consumers. Realizing this fact, governments around the world have historically invested in scientific research and technology development.

If the marketplace functioned perfectly, Federal initiatives might not be needed to help the private sector research and develop promising new energy technologies. But changes in the marketplace, industrial restructuring and the nature of technology development have all acted to discourage investments in technology R&D in many areas. These changes include:

- downsizing operations resulting in cuts in company investments in high-risk, long-term research;
- skyrocketing costs of increasingly specialized research that most individual companies are unable to bear;
- difficulties in protecting intellectual property rights in a global economy and consequent inability to recoup major R&D investments;
- the breakneck pace of technological and market change;
- the complex, cross-cutting nature of much modern R&D - such as advanced materials - that cuts across companies and traditional disciplines; and
- the lack of alignment between the near term priorities of individual companies and the strategic interests of the nation.

These changes do not mean that the federal government should have a role in all technology R&D. However, carefully targeted federal involvement in close partnership with the private sector can help the marketplace function more efficiently and facilitate the development of American competitive advantage in technologies that might otherwise be developed by our global competitors. The federal government should consider funding a technology if:

- there is a high social rate of return;
- it fulfills a strategic national need; and,
- the private sector cannot develop it alone.

The energy efficiency technology research and development programs in the FY 1997 Conservation budget request are all conducted in partnership with private stakeholders and are carefully selected to meet the above criteria. These programs are developing critical technologies that would otherwise not occur at all, would be delayed substantially, or would be captured by competitors if it were not for the federal government role.

The federal government has played a pivotal role in developing the world's most successful system of research and development. Maintaining the vigor of research and development is important - indeed essential - to the nation's future and will require the ability to increase funding for new opportunities selectively, even while reducing the overall budget. (*Allocating Funds for Science and Technology*, National Academy of Sciences 1995.)

Situation Report

The following factors were considered in the FY 1997 Congressional Budget Request for energy efficiency and renewable energy:

- National Science Foundation data indicate that the U.S. investment in R&D is in decline. Since 1987, Federal R&D investments have dropped steadily in real terms. Since 1992, industry R&D has stagnated. And today, less than one-third of private R&D is dedicated to research; the rest is being spent on product and process development.

- At a time of increased public concern about environmental quality and the rising costs of environmental compliance for businesses, energy efficiency and renewable energy technologies offer pollution prevention solutions that often pay for themselves through energy savings and waste reduction.

- As a percent of gross national product, the U.S. national investment in non-defense R&D remains well below that of Japan and Germany. U.S. energy efficiency, measured as energy consumption per dollar of gross domestic product, also remains well below that in Germany and Japan.

- U.S. oil imports are at record levels, are continuing to grow, and could to reach nearly 60 percent by 2005. Oil imports that high would "contribute" nearly $90 billion to the trade deficit and, according to a Department of Commerce analysis earlier this year, constitute a threat to U.S. economic security. Persian Gulf countries are projected to control 70 percent of the global market for oil by 2010 - making world oil markets increasingly unstable.

- Energy consumption continues to have a real impact on individual Americans. The typical American family of four is spending $2,200 each year on energy -- more than all other expenses except housing.

- Energy efficiency and renewable energy technologies save money, prevent pollution and create jobs today and tomorrow. These technologies range from the advanced wind turbines that provide commercial electricity for more than one million Americans, to more energy efficient appliances in virtually every kitchen, to electronic ballasts saving up to 30 percent on lighting costs - all developed with DOE support. Research on many of tomorrow's best energy technologies is supported by DOE today. Significant Federal disinvestment in this research will lose or substantially delay these technologies and their benefits. By the year 2000, for example, a 10% budget cut would increase U.S. energy costs by nearly $1 billion, reduce net new jobs in the economy by 7,000, increase air pollution by nearly 4 million metric tons of carbon equivalent, and add hundreds of thousands of tons of sulfur dioxide and nitrogen oxide pollutants to the environment.

Alignment with Administration Priorities

The energy efficiency and renewable energy programs proposed by DOE for FY 1997 will continue progress toward achieving key goals of the Administration's research and development agenda:

- **Building International Competitiveness with Technology**. Technology development is the key driver of long term economic growth for our nation. Sustained economic growth is dependent upon steady increases in the efficiency of the production processes. Technology is the key *enabling input* because it increases the efficiency in which inputs are used, thereby enabling a country to produce more with less. Realizing this fact, governments around the world have historically invested in scientific research and technology development. The federal government has played a pivotal role in developing the world's most successful system of research and development. Maintaining the vigor of research and development is important - indeed essential - to the nation's future and will require the ability to increase funding for new opportunities selectively, even while reducing the overall budget. (*Allocating Funds for Science and Technology*, National Academy of Sciences 1995.)

- **Maintaining world leadership in science, engineering and mathematics**. DOE's National Renewable Energy Laboratory, for example, has won 17 R&D 100 awards since 1982. (R&D 100 awards recognize the nation's most important technological advances.) In the last year alone, widely praised technological breakthroughs among DOE's national laboratories included a new, flexible superconducting material; a new type of lighting system -- the Sulfur Lamp -- that will revolutionize how buildings are illuminated; a new insulating material 10 times more effective than fiberglass; a biologically engineered bacteria that will make it cheaper to produce ethanol fuel from wastes and energy crops; and an improved method for making high-quality ceramic powders to manufacture industrial products.

  Promoting long-term economic growth that creates jobs. A growing body of analysis concludes that money invested in energy efficiency produces more jobs than money invested in conventional power production and in a host of other common economic activities. Newly published case studies demonstrate that energy efficiency technologies not only cut costs and save jobs for businesses, but significantly improve their productivity. Estimated annual energy cost savings resulting directly from supporting the 1997 programs are nearly $11 billion per year by the year 2000 and over $70 billion by 2010. Other cost savings in industry (increased production and reduced environmental compliance) are estimated at $20 billion by 2000 and $66 billion by 2010. Resulting job creation is expected to be 19,000 by 2000 and 180,000 by 2010.

  Improving the nation's environmental quality. In developing and promoting the efficient use of clean energy resources, DOE's energy efficiency and renewable energy programs result in reduced air, water and ground pollution, often reducing industry environmental compliance costs, concurrent with reduced

1077

production costs. In other words, these technologies make environmental progress compatible with economic growth and improved productivity. Estimated reductions in greenhouse gas emissions alone are projected to be 38 million metric tons (MMT) in 2000 and over 150 MMT by 2010. Similar substantial reductions in other air emissions and waste production are projected.

Strategic Priorities

The DOE energy efficiency and renewable energy budget request supports a balanced portfolio of high-priority technology research and development that will achieve the above goals. Key priorities include:

- A Presidential public Partnership for a New Generation of Vehicles (PNGV), including advanced materials, energy storage, and other new technologies that will triple the efficiency of U.S. transportation while improving safety and environmental quality;
- Technologies that concurrently meet energy, economic, and environmental objectives, deployed voluntarily through the Climate Change Action Plan;
- Advanced construction and building technologies;
- Advanced biotechnologies;
- Advanced power generation technologies using renewable energy resources and building upon recent advances in superconductivity, energy storage and system control technology;
- Technologies leading to improved energy and resource efficiency of energy-intensive industries, which reduce environmental emissions and cut business compliance costs; and
- Investments in federal energy efficiency that cut government operating costs.

These technologies and many others are developed and delivered through five mechanisms:

- **basic and applied research** to help industry develop new energy efficiency technologies that are clean and competitive globally;
- **cost-shared** demonstration projects with industry to test, prove and measure the benefits of new energy technologies;
- **market collaboratives**, in which DOE creates partnerships between industry, state and local governments, other government agencies, universities, nonprofit organizations and others to speed the commercialization of the latest energy technologies;
- **grants to states** and low income Weatherization providers to accelerate the local application of energy efficiency technologies; and
- **information and education** programs to help ensure that consumers have up-to-date and accurate information as they make their energy choices.

1078

To maintain program excellence while minimizing costs, DOE's energy efficiency and renewable energy programs reflect these principles emphasized by the Administration:

Peer Review: In addition to the Yergin Commission review quoted above, DOE's energy efficiency and renewable energy programs for FY 1997 reflect an internal evaluation and prioritization process. Based on the A.D. Little & Co.'s "Third Generation" R&D portfolio analysis, the Office of Energy Efficiency and Renewable Energy has conducted an intensive analysis of all our historic programs resulting in 56 key programs comprised of our highest priority projects. Completions, efficiencies and strategic review based consolidations, scope and schedule changes, and terminations allowed us to reduce our spending while maintaining our priorities.

Joint Funding: One method for insuring our technologies are market directed is to collaborate and increasingly cost share our technology development as it moves from basic research to product development. DOE routinely requires cost sharing from industries, states and other program partners ranging from a fractional partners share in risky research to a dominant cost-sharing for scale-up and deployment efforts. The department's goal is to achieve maximum leveraging from Federal funds. In one recent case, for example, $500,000 in Federal funds were used to attract nearly $33 million in state, local and private funds to DOE's Rebuild America program, an initiative that implements energy efficiency technologies in commercial and government buildings at the state and local level.

Multiple Goals: Few Federal programs produce such diverse benefits. Benefits from DOE's energy efficiency and renewable energy activities include: reduced pollution and related health-care costs; reduced oil imports; lower trade deficits; increased local and national economic security; maintaining the key U.S. competitive advantage of low energy prices; lower consumer energy bills; lower taxpayer costs for energy consumption in public buildings; increased industrial competitiveness; competitive U.S. products for vibrant new export markets; reduced threats of future military actions to assure foreign energy supplies; the creation of new industries and jobs; and hands-on educational opportunities for the next generation of scientists and engineers. DOE energy efficiency and renewable energy programs produce consequential benefits across all these categories this year and will for years into the future.

Performance Measures: The Office of Energy Efficiency and Renewable Energy has developed a peer-reviewed "quality metrics" system that allows DOE to set concrete goals, measure program progress, impacts and success. This evolving strategic management process, while providing valuable

1079

input to program planning and improvement, anticipates and exceeds the requirements of the Government Performance and Results Act of 1994.

The FY 1997 Budget Request Represents a New Way of Delivering Returns to Taxpayers

In addition to modifying our portfolio to meet new futures, the Office of Energy Efficiency and Renewable Energy is re-engineering HOW we offer it. We are reinventing how government interacts with the private sector.

Rather than command-and-control mandates, we are working more closely with the American public, our customers, building voluntary partnerships with industry, business, state and local governments and energy consumers. Instead of assuming that government knows best, we are using the talent and creativity of our customers to help design and implement these programs. We are replacing regulation with collaboration.

Rather than relying on taxpayers to bear all costs, we are using relatively small amounts of Federal money to leverage large amounts of private investment.

Rather than "one size fits all" programs, we are stressing flexibility and innovation. And rather than sweeping, over-reaching programs, we are helping America move to a new energy future through a balanced program of next generation technologies and market driven incremental improvement - taking small innovative, imaginative but manageable steps.

In a time of fiscal austerity, we are cutting administrative costs and overhead, downsizing operations and learning how to operate more efficiently.

We are committed to continuous improvement, customer involvement and market-driven action. We are striving to operate more like a business, and less like a bureaucracy.

Rather than vague promises of progress, we are setting clear goals and annual progress targets so that we may show that technologies with inherent risk are making expected progress or needed adjustments to deliver the better future and larger bang for the buck that taxpayers need, demand and deserve.

1080

SOLAR AND RENEWABLE RESOURCE TECHNOLOGIES

PROGRAM MISSION

Energy is fundamental to the general welfare of a modern nation. This is especially true for the U.S. where the wide availability of affordable and reliable energy drives the engines of our economy and supports our comfortable standard of living. Continued availability of low cost energy is important to all American citizens and is properly a concern for Federal officials. While current energy supplies are generally adequate, growing domestic demand and major increases in worldwide demand lead inexorably toward periodic supply disruptions, scarcity of selected fuels, and price instabilities. With large populations in emerging nations annually creating new appetites for energy driven commodities and services, and with their leaders striving for immediate fulfillment, we are witnessing a concentration of energy resources on raw supply systems, to the detriment of control systems, ultimately leading in turn to undesirable, and potentially unacceptable, environmental consequences. It becomes clear that business-as-usual methods alone will not be adequate for the future. New options will be needed to complement and assist efforts to expand current energy systems. The family of renewable systems proposed in this budget request -- winnowed during the 1980s from examination of over 3 times the technologies presented herein -- offer the most attractive and complete set of energy options to potentially fill this need. The characteristics of environmental friendliness, domestic availability and, once installed, inherent resistance to price escalation that accompany their use constitute an undeniable set of benefits that make adoption of renewable systems a positive step for the U.S. and for other nations as well. Simply stated, the activities and programs described below will establish and ensure clean choices for our energy future.

The Solar and Renewable Resource Technologies Program funds research and development in two related areas. First, the Program supports R&D of new, efficient, reliable and environmentally sound renewable energy technologies for the utility, transportation, industrial, and buildings sectors. Second, Program funding supports R&D related to advanced utility system technologies necessary for integration of renewable energy systems into the utility grid. In addition, the Program provides support for the initial deployment of solar and renewable energy technologies into domestic and international markets.

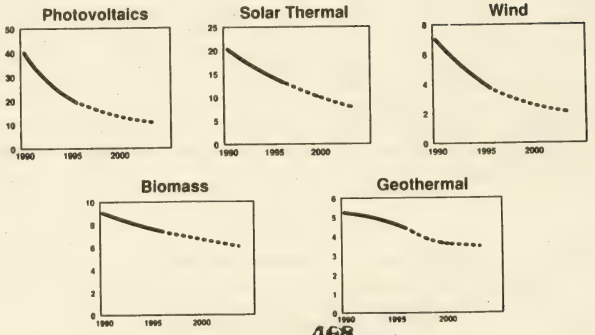
Past funding of these R&D activities has yielded remarkable results with respect to renewable energy technology efficiency and economics, bringing the concept of a renewable-based electric power system closer to

reality. Royal/Dutch Shell Company's planning group, an internationally recognized leader in energy forecasting and planning, projects significant market share for renewable energy technologies in the first decades of the 21st century, largely based on the technology cost reductions spurred by DOE's R&D investments. The following figures illustrate the dramatic progress made in reducing the costs of these technologies in recent years:

Cost of Electricity

(cents/kWh)

(levelized constant 1995$)



PROGRAM MISSION - SOLAR AND RENEWABLE RESOURCE TECHNOLOGIES (Cont'd)

The Program's funding request for Fiscal Year 1997 is driven by three objectives central to achieving long-term success:

1. Maintain U.S. technological superiority in renewable energy and advanced utility system technologies by funding a balanced portfolio of R&D in renewable systems and supporting electric technologies.

2. Improve environmental quality through increased use of non-polluting renewable energy technologies, and advanced electric power systems.

3. Expedite technology transfer to, and promote the competitiveness of the U.S. renewable energy industry by building export potential for renewable energy technologies through technological superiority and improved manufacturing processes for renewable energy devices and systems.

OUT BENEFITS:

Analysis of OUT program benefits indicates that by 2010, 1.2 to 1.7 quads per year of primary energy will be displaced by clean manufactured renewable energy. This is equivalent to not building one hundred coal power plants of 250 MW each. This energy savings will result in multiple benefits for the country. Up to 35 million metric tons of potential carbon equivalent emissions will be reduced, helping the country meet its energy needs without harming the global environment. There are also huge potential economic benefits from the sale of OUT-related technologies in international electricity markets. The International Energy Agency forecasts that by the year 2010, the world will add 1,400,000 MW of electricity capacity, 50% of which will be in developing countries. Over this period, the export market potential for renewable energy technologies is greater than $1 trillion.

PERFORMANCE MEASURES:

1. Market penetration and technology substitutions: The ultimate success of an R&D program is in the commercial application of the technology. The commercial applications we see today are the results of R&D conducted several years earlier

Thus, while commercialization is the best measure of the success of an R&D program over time, it is not a reliable indicator of the success of any given year's R&D efforts. The performance objectives of the Solar and Renewable Resource Technologies Program for U.S.-produced systems installed domestically and overseas in the year 2000 are:

PROGRAM MISSION - SOLAR AND RENEWABLE RESOURCE TECHNOLOGIES (Cont'd)

-- Photovoltaics: 500 megawatts installed domestically and 200 megawatts overseas.

-- Solar Thermal Electric: 400 megawatts domestic and 200 megawatts overseas.

-- Wind: 3,700 megawatts domestic and 4,000 overseas.

-- Geothermal: 500 megawatts domestic and 2,500 megawatts overseas, installed or under development. Reduce electric peak loads by 2,000 megawatts from domestic Geothermal Heat Pumps.

-- Biofuels: 1,200 megawatts of new electric power domestic, and 800 megawatts overseas; 600 million gallons of biomass-derived transportation fuels produced per year.

-- Solar Domestic Hot Water: Increase market penetration rate by 40 to 60 percent.

2. Reduction in the cost of energy from renewable technologies. As these costs come down, market opportunities increase providing the basis for further cost reductions. Program cost reduction goals for the year 2000 are as follows:

-- Photovoltaics: 10 to 15 cents per kilowatt-hour, from the current level of over 20 cents.

-- Solar Thermal Electric: Less than ten cents per kilowatt-hour from approximately 17 cents (solar only mode) today.

-- Wind: 2.5 cents per kilowatt-hour for good wind areas from the current four to five cents.

-- Geothermal: 3.5 cents per kilowatt-hour for average grade resources compared to current 5 to 8 cents per kilowatt-hour.

-- Solar Domestic Hot Water: 25-40 percent reduction in installed cost.

-- Biofuels: Reduce the cost of ethanol from biomass by 50 percent by the year 2010 from the current cost of $1.22 per gallon.

3. Improvement of technical indices of system performance: These include photovoltaic conversion efficiency, wind turbine efficiency, geothermal power plant conversion efficiencies, and improving the hot-gas cleanup performance of biomass-powered thermal systems.

PROGRAM MISSION - SOLAR AND RENEWABLE RESOURCE TECHNOLOGIES (Cont'd)

4. Initiate and complete proof-of-concept and demonstration projects. All solar and renewable energy technology programs incorporate pilot-scale projects as key elements in the demonstration of the capability and economics of renewable technologies. The ability to successfully complete such projects with industry partners as part of an integrated R&D program is key.

The fiscal year 1997 Solar and Renewable Technology Program is designed to build upon these accomplishments through a focused and intensive R&D effort. This effort will be guided by a strong analytical capability and close consultation and collaboration with the companies and customers that will carry successful technologies into the market.

Key milestones for the renewable energy technology are summarized in the following chart.

1085

I. Mission Supporting Goals and Objectives:

A. Program Description

The mission of the Solar Buildings Appliances R&D Program is to conduct the research and development (R&D) necessary to develop energy producing technologies that will provide economically competitive sources of energy in buildings for our nation. These environmentally clean U.S. based energy technologies will ensure a more secure energy future. This program will work with partners and customers to ensure that technologies are developed that will meet the needs of the public and the marketplace, improve the environment and guarantees continued global competitiveness. R&D goals are to develop solar building technologies which are competitive with electricity in the near term and gas/oil in the long term. The objective is to support R&D activities which are integral to advancing the science and technology base that will maintain steady progress to overcome the remaining barriers of reliability, consumer awareness/confidence, and high first cost, allowing accelerated technology deployment in the conservative building sector.

Since the mid-1970's an estimated 1.2 million active solar water heating systems have been installed nationwide, generating an estimated 25,000 job-years of employment. Export sales over the last ten years have exceeded domestic sales by a factor of 3 to 1. Additionally, the U.S. solar building industry has experienced steady market growth rates of 15-20% in both domestic and international market sectors in recent years. While this is great progress, it represents only 1% of the domestic and a minor fraction of the international water heating market potential. The solar water heating industry consits of fragmented and small entrepreneurial businesses in a labor intensive business which provides almost exclusively low to moderate income blue collar jobs. This fledgling industry does not have, nor can it afford, the kind of technical expertise provided by the solar program in addressing significant technical barriers to the widespread utilization of this promising technology. Technical feasibility and market viability has been established, but widespread utilization of this technology requires a sustained solar buildings program effort in partnership with the industry.

Today the industry is experiencing a tremendous rebirth of interest and slow, but steady growth within the public and private sector, including a collaborative involving almost 100 utilities with the potential for providing additional market penetration growth of 100-300% in the next 3-5 years. This growth requires the technical reassurances provided by the specific activities of the Solar Buildings Appliances R&D Program. These activities will be instrumental in developing a technology base which will reduce the cost of solar water heating to 4 cents per kWh and the cost of solar air heating to 1 cent per kWh. Achieving these goals

I. Mission Supporting Goals and Objectives: SOLAR BUILDINGS APPLIANCES R&D (Cont'd)

will make these technologies very cost-competitive with electricity (for water heating) and natural gas (for air heating), allowing significant market penetration.

The Solar Buildings Appliances R&D program has invested in solar technologies for building applications since 1974. After federal tax credits expired in 1985, efforts focused on the most cost-effective applications such as solar domestic hot water (SDHW), and the cost of solar energy has dropped from about 20 cents per kWh in 1980 to about 8 cents per kWh today. Research supports by DOE also led to a technical breakthrough (the transpired solar collector) which reduced the cost of solar air heating from about 20 cents per kWh in 1980 to about 2 cents per kWh today by increasing system efficiency from 30% to 70% and reducing system costs by a factor of 5.

More than one million solar systems have been installed in residential and commercial buildings in the U.S. These systems currently displace more than 2600 megawatts (thermal energy equivalent) and 840 megawatts of utility peak demand. However, this is less than 1% of the potential buildings market. To increase market penetration, the program has parallel efforts in: 1) quality assurance activities to ensure deployment of certified and tested systems, 2) technology deployment activities collaborating with the solar industry, utilities, and energy service companies (ESCOs) to develop effective means to deliver the technology to end-users, and 3) technology development activities to develop advanced designs to reduce the costs of delivered energy so that it meets end-user cost-effectiveness requirements in most parts of the United States.

Quality Assurance. The program, working in collaboration with the industry, is finalizing a major effortin development of a national rating and certification program to address quality assurance issues.

Technology Deployment. The program is working with interested utilities in the USH2O (utility solar hot water) initiative to develop the energy service company (ESCO) approach for delivering solar water heating to end-use customers in new utility programs across the country.

Technology R&D. The major future thrust for the program will be focused on technology R&D. Today's solar building technologies have the advantage of competing with retail utility rates rather than utility generation costs and are in theory cost-effective on a life-cycle cost basis. However, to actually achieve significant market penetration, these technologies must provide the very short paybacks (or high rates of return) required by end-users. By bringing costs down to 4 cents per kWh for solar water heating and 1 cent per kWh for solar air heating by 2000, the Solar Buildings Appliances R&D program will help make solar heating a cost-effective option for residential and non-residential end-users across the country. The program will also conduct R&D to develop new cost-effective applications for low-temperature solar technologies.

I. Mission Supporting Goals and Objectives: SOLAR BUILDINGS APPLIANCES R&D (Cont'd)

A program strategy of industry cost-shared research and development and mass procurement of advanced technologies in the electric utility, building, and government sectors is expected to decrease cost by 50-75%, resulting in widespread use. By the year 2000, solar building technologies will produce $90 million in annual energy savings and an annual reduction of 0.24 million metric tons of carbon equivalent.

B. Estimates of Benefits:

At the proposed funding levels, the Solar Buildings Appliances R&D Program is expected to yield the following quantifiable benefits:

	2000	2010	2020
Total Primary Energy Displaced (Billion BTUs)	12,000	27,000	91,000
Total Cost Savings (Millions $ 1995)	$90	$229	$813
Carbon Equivalent Emissions (MM Tons)	0.24	0.60	2.04

C. Performance Measures (highlights):

Goals for 2000

The following performance measures will allow the Solar Buildings Appliances R&D Program to determine progress toward the program goals for 2000 of reducing the cost of solar water heating from 8 cents per kWh today to 4 cents per kWh and the cost of solar air heating from 2 cents per kWh today to 1 cent per kWh. Additionally these measures will assure progress towards increasing system life expectancies from a range of 10-15 years to 15-20 years for both hot water and air heating systems. These cost reduction goals will be accomplished by R&D activities focused quality assurance of the current technology, technology development of advanced hardware and manufacturing processes, and technical support to assure successful entry into mass markets providing economies of scale soon as the utility - energy service company solar initiatives.

1996 Performance Measures

-- 1-2 additional utility cost-shared solar building initiatives in place for promoting mass markets for 10-20% reduction in installed system cost.

-- Complete the conceptual design of an optimum balance-of-system and identify key component development needs for low-cost solar domestic hot water systems with potential for 20-30% reduction in installed system

I. Mission Supporting Goals and Objectives: SOLAR BUILDINGS APPLIANCES R&D (Cont'd)

cost.

-- 3-6 states/utilities using industry voluntary rating and certification procedures.

-- National sales of 6,250 solar domestic hot water systems (0.18% of 1993 total annual market).

1997 Performance Measures

-- 2-4 additional utility cost-shared solar building initiatives in place for promoting mass markets for 10-20% reduction in installed system cost.

-- Initiate prototype development of industry cost-shared initiatives for next generation of solar domestic hot water equipment with 25-40% increased cost effectiveness.

-- Initiate industry cost-shared development of fully-certified integrated balance of system/tank module to meet national building codes leading to a 15-25% reduction in installed cost with increased service reliability/durability.

-- 9-12 states/utilities using industry voluntary rating and certification procedures.

-- National sales of 12,250 solar domestic hot water systems (0.36% of 1993 total annual market).

1998-99 Performance Measures

-- Total of 10-15 utility solar building initiatives in place for promoting mass centralized markets for 20-30% reduction in installed system cost.

-- Total of 15-20 states using industry voluntary rating and certification procedures.

-- National sales of 25,000 solar domestic hot water systems (0.7% of 1993 total market).

-- First system manufactured using the integrated balance of systems concept reaches market.

2000 Performance Measures

-- Deploy solar heating technologies capable of producing solar water heating and solar air heating energy

I. **Mission Supporting Goals and Objectives:** SOLAR BUILDINGS APPLIANCES R&D (Cont'd)

savings at costs of 4 cents per kWh and 1 cents per kWh, respectively.

-- National sales of 40,000 solar domestic hot water systems (1% of 1993 total market).

II. **Funding Schedule:**

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Space Conditioning and Water Heating.....	$ 4,349	$ 1,942	$ 5,000	$ 3,058	+157
Total, Solar Buildings Appliances R&D	$ 4,349	$ 1,942	$ 5,000	$ 3,058	+157

III. **Performance Summary:** SOLAR BUILDINGS APPLIANCES R&D

FY 1995 Accomplishments:

- Space Conditioning and Water Heating ($4,349)

  National rating and certification program for solar thermal products gained additional acceptance, being required by two more state incentive programs and re-affirmed by HUD.

- Unglazed transpired collector for vent air pre-heat received national awards (R&D 100, Popular Science "Best of What's New"). Design tools were developed and made available to industry, which resulted in a 15% increase in system efficiency. Six new systems were installed in 1994 and ten more in 1995.

- A new structure for utility SDHW incentive programs was developed, involving a utility/ESCO partnership. This program structure addresses first cost and reliability concerns arising in the open, rebate-based program structure employed previously.

FY 1996 Accomplishments (to date and planned):

- Space Conditioning and Water Heating ($1,942)

  Completed transition of national certification program from development to application for 80% of the

III. **Performance Summary**: SOLAR BUILDINGS APPLIANCES R&D (Cont'd)

. solar domestic hot water system types. Established certification requirement for 3-4 additional states, utilities, and code municipalities.

- Validated economic viability of utility-energy service company (ESCO) model program structure for solar domestic hot water systems. Provided technical monitoring and evaluation support to consortium of 1-2 utility-ESCO solar initiatives and pending ESCO arrangements resulting in a 10-15% reduction in installed system cost and 20-25% increase in market penetration rate.

- Developed new concepts and potential applications for unglazed transpired collector solar systems focused on highly replicable standardized building designs for mass produced building manufacturers of light commercial/industrial/agricultural buildings providing a 2-4 year payback on installed system cost and 20-30% reduced energy consumption. Achieved a 50-100% increase in the total number of ventilation air pre-heat installations.

- Completed conceptual designs for a fully assembled/manufactured active solar domestic hot water (SDHW) balance-of-system and a passive SDHW system with 15-20-year service lives at sustained levels of performance with 15-30% reduction in life-cycle cost.

FY 1997 Planned Accomplishments:

- Space Conditioning and Water Heating ($5,000)

  Complete final technical hurdles for a National Rating and Certification Procedure for all solar domestic hot water system types and complete transfer of implementation process for solar systems to industry.

- Establish 2-4 utility-energy service company solar initiatives resulting in 40-60% increased market penetration rate and 25-40% reduction in installed system cost.

- Initiate industry cost-shared initiatives to develop the next generation of solar equipment and optimized manufacturing processes by the year 2000. Conduct prototype development and testing of most promising concepts offering an additional 30-50% increased cost effectiveness and 20-year service lives.

- Solicit industry concepts on the cost-shared development of photovoltaic building applications with 20-30% improved cost effectiveness through innovative architectural integration techniques.

- Complete feasibility study of combined photovoltaic/thermal hybrid solar collector with 200% increase in overall system performance over current photovoltaic systems with only a 15-20% increase in total system

III. **Performance Summary**: SOLAR BUILDINGS APPLIANCES R&D (Cont'd)

cost.

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 3,058,000 in Space Conditioning and Water Heating (in Solar Buildings Appliances R&D) will restore funds needed to maintain critical core research and development activities which were cancelled, deferred, and extended as a result of the 62% budget reduction in FY 1996. Specifically this consists of the following:

-- Increase of $1,462K in Technology Development R&D to initiate cost-shared development of integrated balance of systems and improved manufacturing processes for existing solar technologies which are cost competitive with electicity in the near-term, and the cost-shared development of the next generation of solar equipment cost competitive with gas by the year 2000.

-- Increase of $1,135K in Technology Deployment activities will provide technical assistance to assure successful design and implementation of utility-energy service company solar domestic hot water initiatives. This will result in a 40-60% growth in market penetration and 30-50% reduction in installed system cost.

-- Decrease of $130K in Quality Assurance for continued transfer of voluntary certification procedures to industry for implementation. It provides for continued technical development of procedures to accomodated advanced systems being developed by industry.

-- Increase of $500K to re-establish Building Integrated Photovoltaic (BIPV) R&D activities which provide for the technical/architectural integration of photovoltaics in the building sector in collaboration with the photovoltaic industry and the Office of Utility Technologies R&D on photovoltaic panels and products. The building sector represents the most cost effective and growing market opportunity for photovoltaic technologies currently under development.

PHOTOVOLTAIC SYSTEMS R&D

I. **Mission Supporting Goals and Objectives**:

A. Program Description

The mission of the Photovoltaic Technology Program is to conduct the research and development (R&D) necessary to develop economically competitive sources of electricity for our nation, thereby ensuring a more secure energy future. R&D goals are to increase the conversion efficiency and performance of photovoltaic devices, reduce manufacturing costs of components and systems, and increase the reliability and lifetime expectancy of modules and installed systems.

Photovoltaic R&D activities are integral to advancing the science and technology base that will maintain steady progress toward long-term goals of improved performance and lower costs. The U.S. photovoltaic industry is currently experiencing annual growth rates exceeding 25% in international and domestic sales. This is the direct result of U.S. science and engineering leadership over the past 20 years. A strong R&D program is essential to maintain our nation's world leadership in this strategic energy industry, which produces high-technology jobs and product exports. Photovoltaic R&D is still considered by industry to be too high-risk and long-term to support on their own. Therefore, a key element of the PV program is to provide a continuing flow of improved technology to industry for its development of globally competitive products.

The FY 1997 budget presents a balanced effort in fundamental and applied research, materials and device development, process and manufacturing improvements, module reliability, and system testing and evaluation. A major portion of the budget will be used in competitive procurements to fund highly leveraged cost-shared projects with U.S. utilities and the emergent PV industry.

Fundamental research activities will continue on several photovoltaic semiconductor materials to resolve issues that limit current technology, and to develop new ideas for next generation (post 2000) technologies. Advanced materials and devices work will continue cost-shared research with industry to improve device efficiency and stability, particularly for large-area thin-film deposition systems. These research activities are core program efforts to develop the advanced technologies that are essential to maintaining U.S. competitiveness in the next 5 to 10 years. The manufacturing process technology effort will start the last phase of the Manufacturing Research and Development portion of the Photovoltaic Manufacturing Technology (PVMat) project cost-shared work with industry to reduce module manufacturing costs, improve module performance, and stimulate investment in new production lines. Assessments of PV industry manufacturing

I. Mission Supporting Goals and Objectives: PHOTOVOLTAIC SYSTEMS R&D (Cont'd)

status and R&D needs will be carried out in FY 1996 to determine follow-on activities. Module and system reliability research will continue to support reliability testing of modules and systems to improve operational lifetime in the field. In cooperation with the Utility PhotoVoltaic Group (UPVG), efforts will be continued to complete cost-shared utility projects designed to establish technical and economic validation in specific high-value applications. In addition, research and analysis relating to restructuring in the electric utility industry will be conducted on issues associated with integration of Photovoltaic systems into an increasingly competitive industry framework. Additional fundamental research on resource characteristics will identify cost-competitive options for systems integration.

B. Estimates of Benefits

At the proposed funding levels, the Photovoltaic Technology R&D Program is expected to yield the following quantifiable benefits:

	2000	2010	2020
Annual Primary Energy Displaced	0.01 Q	0.03 Q	0.89 Q
Annual Displaced Electricity Value ($0.07/kWh)	$93 M	$224 M	$2,737 M
Carbon Equivalent Emissions Reductions	0.29 MMT	0.65 MMT	7.67 MMT

The U.S. photovoltaic industry has been growing at an annual rate of 20-25% over the past five years and is now the leader in sales throughout the world. The strong and aggressive DOE R&D program has been instrumental in establishing the U.S. PV industry as the leader in a very competitive and rapidly growing global marketplace.

C. Performance Measures

Goals for 2000

-- Increase the conversion efficiency of commercial modules from the current 7% to 10% or better for thin films, and from the current 14% to 15% or better for crystalline silicon.

-- Reduce the manufacturing costs of commercial modules by 50% from current average costs of about $3.50/watt.

-- Attain 700 megawatts in U.S. PV industry cumulative sales compared to cumulative sales through 1995 of 216

I. **Mission Supporting Goals and Objectives:** PHOTOVOLTAIC SYSTEMS R&D (Cont'd)

megawatts.

1996 Performance Measures

-- Develop a 17.5% efficient prototype thin film solar cell.

-- Develop a 19% efficient prototype crystalline silicon large-area cell on a low-cost material.

-- Complete Photovoltaics Building Opportunities in the U.S. (PV-BONUS) program.

1997 Performance Measures

-- Complete the Phase I testing and evaluation of 8-11 UPVG utility PV systems totaling 5 megawatts of installed capacity.

-- Develop a low-cost, stable module encapsulant with potential for 25-year life.

-- Achieve greater than 9% efficient thin film commercial modules.

1998-1999 Performance Measures

-- Develop an 18% efficient prototype thin film solar cell. (1998)

-- Develop a 13% efficient prototype stable amorphous silicon solar cell. (1999)

-- PVMaT reduces manufacturing costs by 50% from 1994 baseline. (1998)

II. **Funding Schedule:**

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Fundamental Research	$ 8,986	$ 9,945	$ 11,000	$ 1,055	+ 11
Advanced Materials and Devices	23,300	23,866	28,000	4,134	+ 17
Collector Research and Systems Development	51,549	27,748	47,994	20,246	+ 73
Total, Photovoltaic Systems R&D	$ 83,835	$ 61,559	$ 86,994	$ 25,435	+ 41

1101

III. **Performance Summary**: PHOTOVOLTAIC SYSTEMS R&D

FY 1995 Accomplishments:

- Fundamental Research ($8,986)

  Several new efficiency records for polycrystalline thin film modules were established, including a 12.6% copper indium diselenide (CIS) sub module. A 1% increase in efficiency of a PV cell from 11% to 12% translates to an increase in electric power production of 9% or 90 kilowatts for every megawatt of installed capacity.

- A new world record efficiency was established for a thin-film polycrystalline photovoltaic cell. The Department's National Renewable Energy Laboratory produced a 17.1 % copper indium diselenide (CIS) cell, surpassing the old record of 16.4%, using a unique hybrid binary deposition method.

- Advanced Materials and Devices ($23,300)

  The first stabilized amorphous silicon (a-Si) module with greater than 10% efficiency was produced by industry, providing good evidence that continuing progress in a-Si multijunction technology will lead to successful commercialization.

- An aggressive thin-film cost-shared industry partnership program was initiated in FY 1995 to develop commercially-viable, thin-film material, cell and module technology for cadmium telluride, CIS, a-Si, and thin film polycrystalline silicon.

- The Department's National Renewable Energy Laboratory produced the first two-terminal, tandem-junction, monolithic, gallium arsenide (GaAs) solar cell with a verified efficiency of more than 30% under concentration. This was a major step from previous efficiencies of around 25 percent toward the program goal of 35 percent efficiencies for this type of solar cell.

- Collector Research and Systems Development ($51,549)

  The Photovoltaic Manufacturing Technology (PVMaT) Project contractors have reduced encapsulation costs by as much as 70%, reduced module material costs as much as 56%, increased yield and throughput of crystal growing production lines by 20%, and increased plant capacity for thick-film polycrystalline silicon cell production to 4.4 MW per year, a 1000% increase. Since its inception in 1991, we worked with industry to reduce production costs by 50 percent.

- U.S. photovoltaic power module sales grew 35% in 1995. Preliminary estimates show continued growth in

III. Performance Summary: PHOTOVOLTAIC SYSTEMS R&D (Cont'd)

1996. This quantity of module production translates to 35 MW for an estimated $300 million in 1995 industry sales.

- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Issued a solicitation which resulted in 13 utility cost-shared projects. The cost-share was 3:1 industry to federal funds. ($10,000)

FY 1996 Accomplishments (to date and planned):

- Fundamental Research ($9,945)

  Continue to assist university and industry researchers to characterize cell materials and devices, diagnose defects and develop solutions. Our world class laboratory facilities at NREL and Sandia will measure and characterize over 10,000 cell samples for industry over the coming year.

- Advanced Materials and Devices ($23,866)

  Complete first-year funding for thin-film partnership contracts resulting in 11% efficient stabilized amorphous silicon cell (1 cm2); a 9% efficient CdTe module; and a 13% efficient CIS sub module.

- Continue reliability testing of cells, modules and balance of system components. This effort supports industry's efforts to extend lifetime warranties on PV modules which stands at 15 years.

- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Complete design phase and begin construction of eight new Utility Photovoltaic Group (UPVG) projects. ($6,000)

- Collector Research and Systems Development ($27,748)

  PVMaT: Complete funding for 16 cost-shared contracts with industry.

- Complete Building Opportunities in the US for Photovoltaics (PV:BONUS) contracts, resulting in five new PV products that can be integrated into commercial and residential buildings, such as innovative PV roofing shingles.

- Continue to test the performance and reliability of balance of system components at the SE and SW Regional Experiment Stations.

III. Performance Summary: PHOTOVOLTAIC SYSTEMS R&D (Cont'd)

FY 1997 Planned Accomplishments:

- Fundamental Research ($11,000)

  Produce a prototype crystalline silicon module with conversion efficiency in excess of 16 percent to maintain steady progress toward mid-term goals of low-cost (less than $1/watt) silicon modules.

- Produce a prototype thin-film module conversion efficiency in excess of 12 percent to maintain steady progress toward long-term goals of low-cost (about $0.50/watt) thin film modules.

- Advanced Materials and Devices ($28,000)

  Develop a low-cost, stable module encapsulant with potential for 25-year life compared to today's 15-year life.

- Develop balance-of-systems components with potential for 15-year life and installation cost ($5 per watt) at no more than 50% of installed total system costs. Today some balance-of-system components have a lifetime as short as 5 years.

- Collector Research and System Development ($47,994)

  PV:BONUS: Complete field testing and assessment of PV: BONUS projects

- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Issue UPVG request for proposals for an additional 13 megawatts of installed capacity in small and large-scale utility projects as part of our PV-COMPACT program. ($18,000)

- Start funding last phase of PVMaT Manufacturing R&D contracts.

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 1,055,000 in Fundamental Research is to restore fundamental research to prior year levels which were impacted as a result of general reductions and rescission actions in FY 1995. This funding will maintain the world class research capabilities at our nation's laboratories and provide for the exploration of new concepts that provide steady advancements into the post 2000 time frame.

III. **Performance Summary**: PHOTOVOLTAIC SYSTEMS R&D (Cont'd)

The increase of $ 4,134,000 in Advanced Materials and Devices will expand R&D partnerships in support of thin film research and engineering. Thin film technology shows significant promise for reducing energy costs from PV systems. The focus is to form partnerships with industry and the extensive expertise available in university science and engineering departments.

The increase of $ 20,246,000 in Collector Research and Systems Development restores funding to the planned level in the Photovoltaic Manufacturing Technology (PVMaT) program, and restores DOE's commitment under PV-COMPACT. PVMaT is cost-shared 1:1 industry to federal funds. PV-COMPACT is 4:1 industry cost-shared. The increment will also support the rapid development of next generation balance-of-system-technologies. The PVMaT program is a highly leveraged program that is strongly supported by industry and addresses technical issues related to manufacturing, fabrication and process engineering of large-area thin film modules. PV-COMPACT is a highly leveraged early deployment partnership with utilities that includes focused education and analysis activities.

SOLAR THERMAL R&D

I. Mission Supporting Goals and Objectives:

A. Program Description

Solar thermal technology works by concentrating large amounts of sunlight to achieve high temperatures, which are used to generate electricity for utility and off-grid applications or process heat for industrial use. Currently, there are three solar thermal electric technologies: power towers, dish/engines, and parabolic troughs. Solar industrial technologies include process heating, detoxification, and materials processes.

The mission of DOE's Solar Thermal Electric (STE) Program is to work with manufacturers, developers, and users of solar thermal electric technology to: (a) develop reliable and efficient solar thermal electric systems that will generate economically competitive power to improve our nations energy security through greater diversity of supply; (b) reduce the environmental impacts of energy production and (c) proactively support the development of these technologies to penetrate peaking and intermediate power generation markets with new energy applications, thus creating business opportunities in the U.S. and abroad and jobs for U.S. workers. The STE Program, in conjunction with the industry and user communities, has developed a leveraged cost-shared program to support the technology research and development necessary to achieve electric generation cost in a competitive range (less than 10 cents/kWh). These projects should allow industry to build commercially successful dish/Stirling, trough, and power tower plants as early as 1999.

The goal of the Solar Industrial Program was to facilitate the increased use of solar energy within the industrial sector. Specific objectives included developing solar technology that: (1) increased the fuel-flexibility in industry, (2) reduced industrial energy costs, (3) reduced or eliminated hazardous wastes resulting from industrial processes, and (4) introduced new solar-based manufacturing processes to enhance U.S. industrial competitiveness. To achieve these objectives, DOE supported cost-shared research and development projects aimed at making solar energy competitive with fossil fuels for the following applications: process heating, detoxification of hazardous chemicals, and certain materials processes. Although the cost of solar process heat has decreased from $40 per million BTUs to less than $8 per million BTUs over the last decade, it is still more costly than fossil fuels. Solar detoxification technology has had an even more remarkable decline in cost; falling by 75% in five years through an aggressive R&D program. The R&D that has driven these cost reductions will continue through FY 1996. Due to the need to reduce Federal spending and to higher priorities in other areas, funding for solar thermal processing is not being requested for FY 1997 and orderly closeout of program activities will take place. It is expected that industry will

I. **Mission Supporting Goals and Objectives**: SOLAR THERMAL R&D (Cont'd)

continue to work toward commercializing solar process heat and detoxification technologies, although at reduced levels of effort.

B. Estimates of Benefits

UTILITY SECTOR

At the proposed funding levels, the STE Program is expected to yield the following quantifiable benefits:

	2000	2010	2020
Annual Primary Energy Displaced	0.00 Q	0.07 Q	0.34 Q
Annual Displaced Electricity Value ($0.07/kWh)	$9 M	$472 M	$2,360 M
Carbon Equivalent Emission Reduction	0.02 MMT	1.00 MMT	2.00 MMT

Solar thermal technologies currently account for 354 MW of installed capacity in the U.S. With the availability of World Bank funding through its Solar Initiative, industry is projecting to add an additional 250 MW (100 MW trough, 100 MW power tower, and 100 MW dish/Stirling systems) in the U.S. and abroad by the year 2000.

INDUSTRY SECTOR

By the year 2010, solar process heat could displace 0.11 quad of the energy industry needs, creating 10,000 jobs. This could expand to 3 quads by 2035, which would reduce the amount of CO2 emissions by 0.375 billion tons per year. Solar energy can also be used to destroy many hazardous chemicals that contaminate industrial processes (e.g. solvents, dyes, fuels, lubricants, pesticides). This would help industry comply with Clean Air and Clean Water regulations by destroying the hazardous chemicals at the end of the process where they are produced.

UTILITY SECTOR

C. Performance Measures (highlights)

The following performance measures will be used by the Solar Thermal Program to track its commitment to help bring these technologies into the marketplace:

I. Mission Supporting Goals and Objectives: SOLAR THERMAL R&D (Cont'd)

FY 1996 Performance Measures

-- Initiate total system testing of the 10-MW Solar Two Power Tower in Southern California. The operation of the system will demonstrate a 3-hour molten-salt storage capability to increase the solar plant's availability.

-- Deploy six 7-kW dish/Stirling units at utility/university/industry sites across the U.S. to gain operating experience in representative environments and better position the industry partner to make commercialization investments.

-- Complete testing of the first generation 25-kW dish/Stirling units. Initiate Phase II (design validation) for both 25-kW dish/Stirling contractors.

FY 1997 Performance Measures

-- Complete the cost-shared portion of the 7-kW dish/Stirling program by supplying 12 commercial-ready units at user sites. Industry will proceed with the commercial development of these systems, focussing on the international marketplace as an initial point of entry.

-- Deploy five 25-kW systems at a grid-connected site in Southern California that will validate the design and performance of the systems.

1998-1999 Performance Measures

-- Complete the test and evaluation phase of the 10-MW Solar Two Power Tower in California; establish the technical and operational feasibility for future commercial power tower plants.

-- First 7-kW and 25-kW dish/engine systems are offered for commercial sales including the deployment of systems at a grid-connected site in the Mojave Desert.

2000 Performance Measures

-- Commercial sales of 1,000 units per year of the remote-scale (7-kW) dish/engine systems, resulting in the creation of 250 new jobs.

-- Commercial sales of 1,400 units per year of the two utility-scale (25-kW) dish/engine systems, leading to

I. **Mission Supporting Goals and Objectives**: SOLAR THERMAL R&D (Cont'd)

the creation of 350 new jobs.

-- Installation and operation of an additional 250 MW of commercial solar thermal electric systems (100 MW trough, 100 MW power tower, and 50 MW dish/Stirling systems) in the U.S. and abroad.

-- Reductions in the cost of solar thermal electric power from the current 17 cents/kWh (solar-only component of the trough systems in California) to under 10 cents/kWh.

INDUSTRY SECTOR

The following performance measures will be used by the Solar Industrial Program to track its commitment to partners attempting to introduce solar technology to the industrial sector.

FY 1996 Performance Measures

-- All program activities will be terminated with the least adverse impact to DOE's partners.

-- At least one company will be positioned to begin the commercialization of detoxification technology for industrial customers.

FY 1997 Performance Measure

-- Because there will be no activities after FY 1996, performance measures will solely rely on industry's success in commercializing technologies that were developed under partnership with the Solar Industrial Program.

1109

II. **Funding Schedule**:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Solar Thermal Electric R&D					
Thermal Systems Research	$ 7,208	$ 6,768	$ 5,800	$ -968	- 14
Power Applications Research	16,323	12,478	17,950	5,472	+ 44
Subtotal, Solar Thermal Electric R&D	$ 23,531	$ 19,246	$ 23,750	$ 4,504	+ 23

II. **Funding Schedule**: SOLAR THERMAL R&D (Cont'd)

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Solar Industrial					
Solar Detoxification	$ 3,119	$ 2,777	$ 0	$ -2,777	-100
Solar Industrial Processes	3,666	2,247	0	-2,247	-100
Subtotal, Solar Industrial	$ 6,785	$ 5,024	$ 0	$ -5,024	-100
Total, Solar Thermal R&D	$ 30,316	$ 24,270	$ 23,750	$ -520	- 2

III. **Performance Summary**: SOLAR THERMAL R&D

FY 1995 Accomplishments:

* UTILITY SECTOR ($23,531)

  Thermal Systems Research ($7,208)

  -- Optical Materials - Polymer optical material constructions demonstrated excellent optical durability during accelerated laboratory exposure tests; outdoor testing at six sites was initiated. An industry advisory panel was formed to facilitate communication with solar, materials, and utility industries.

  -- Concentrators - Developed new system to improve optical performance of facets. Upgraded Solar One heliostats for operation under Solar Two. Refined the Solar Two heliostat canting and cleaning procedures. Upgraded Beam Characterization System (BCS) for enhanced heliostat and dish testing and alignment.

  -- Receivers - Fabricated and successfully tested a felt-wick heat-pipe receiver for a Stirling engine. Completed testing of a 2nd-generation hybrid pool boiler receiver for the 25-kW dish/Stirling system. Completed construction and on-sun testing of a 30-kW Brayton-cycle power conversion system for use on a 25-kW dish.

  -- Power Tower Support - Provided technology support for molten-salt systems at Solar Two 10-MW power tower site.

  Power Applications Research ($16,323)

III. **Performance Summary**: SOLAR THERMAL R&D (Cont'd)

-- Troughs - Completed O&M cost savings study for parabolic troughs. Analysis indicated a net present value of between $42M and $70M in O&M cost savings over the next 20 years of plant operation. DOE's cost-share, over 3 years, to achieve these savings was $2.1M.

-- Remote-Scale Dish/Stirling - Commenced Phase II (design validation) of the 7-kW dish/Stirling project. Successfully demonstrated a 7-kW solar receiver at full-scale using quartz lamps. Initiated remote control capability on a dish/engine system at a utility site. Tested heat-pipe receivers on-sun for over 2,000 hours.

-- Utility-Scale Dish/Stirling - Completed Phase I (concept validation) of Science Applications International Corporation's (SAIC) 25-kW dish/Stirling system. Phase II (design validation) on-sun testing began in June 1995. Cummins Power Generation, Inc. installed two concentrators in June 1995, and began on-sun testing of its 25-kW system in August 1995.

-- Solar Two Project - Engineering was 97% complete, construction was 67% complete, startup and checkout procedures were initiated, test and evaluation was commenced, and dedication is expected in June 1996. The new receiver and additional heliostats have been installed.

-- SolMat - Placed two heliostat contracts under the SolMat initiative in the spring of 1995. Issued 2nd SolMat solicitation for other key solar thermal components in June 1995.

-- Design Assistance & Program Support - Performed systems analyses and provided technical assistance to solar thermal technology users through testing, evaluation, technology development, education and outreach. Initiated a cooperative project with Sacramento Municipal Utility District (SMUD) to evaluate the feasibility of a 30-MW combined-cycle power tower ("Kokhala" Project) as a follow-on to Solar Two. Assisted state and federal institutions in selecting cost-effective renewable technologies, in providing solar resource data, and in refurbishment studies for existing solar trough systems.

- INDUSTRY SECTOR ($6,785)

Solar Detoxification ($3,119)

-- A CRADA was signed with International Technology Corp. to assist them in developing the photocatalytic process which uses solar energy or ultra violet energy from lamps to destroy hazardous chemicals in an air stream.

-- Development of a new catalyst for the solar detoxification process by SolarChem Environmental was

III. Performance Summary: SOLAR THERMAL R&D (Cont'd)

shown to be fifty times more efficient than other catalysts for applications in removing solvents and fuels from water. A field experiment at an oil refinery was initiated.

Solar Industrial Processes ($3,666)

-- Cooperative projects were established with the Environmental Protection Agency, California Department of Corrections, Jefferson County (Colorado) Detention Facility, Sacramento Municipal Utility District, and several other government and industry organizations to determine the effectiveness of solar process heat in providing a portion of their thermal energy needs.

-- R&D support continued to improve the reliability of a solar powered refrigeration system operating in a remote fishing village in Mexico. In addition operating data was obtained and analyzed from this system, which is providing the only source of refrigeration to the village.

-- The process developed by the National Renewable Energy Lab that produces silicon carbide at half the cost of other methods won an R&D 100 award as one the 100 most technologically significant products of 1995. The process is now being commercialized by Coors Ceramics Co. under a cooperative research and development agreement (CRADA).

FY 1996 Accomplishments (to date and planned):

- UTILITY SECTOR (19,246)

Thermal Systems Research ($6,768)

-- Solar Thermal R&D - Entered 2nd year of optical materials outdoor testing. Support efforts to improve optical performance and durability of facets. Initiate testing of stretched-membrane heliostats at Solar Two site. Complete on-sun testing of second-generation hybrid (solar/natural gas) reflux receivers for 25-kW dish/Stirling systems. Test high-temperature receiver for Brayton-cycle system. Resolve technical, construction, emission, and operation issues to incorporate hybrid receivers into dish/engines. Incorporate new high-temperature gas receiver on Brayton system.

Power Applications Research ($12,478)

-- Remote-Scale Dish/Stirling - Initiate testing of six commercial-ready 7-kW dish/Stirling units, which when successfully completed will allow Cummins to begin commercial production at their new dish manufacturing plant in Abilene, Texas.

III. **Performance Summary**: SOLAR THERMAL R&D (Cont'd)

-- Utility-Scale Dish/Stirling - Complete the testing and evaluation of the proof-of-concept demonstration phase of the 25-kW dish/Stirling units. Integrate 3rd generation Stirling engine with 2nd generation dish components for the Phase II systems to be deployed at utility sites.

-- Solar Two Project - Initiate full-scale testing and operation of the 10 MW Solar Two power tower pilot plant.

-- SolMat - Complete technology evaluation phase and begin manufacturing evaluation phase for two heliostat designs to validate the system and determine performance. Place two additional contracts, one for an advanced state-of-the-art molten-salt receiver, and the other for a composite material concentrator. The former will improve plant efficiency, and the latter will reduce the number of heliostat parts by 25%.

-- Design Assistance & Program Support - Continue to perform system analyses and provide technical assistance to users of power tower, dish/engine, and parabolic trough technologies through testing, evaluation, technology development, education and outreach. Perform case studies of viable projects as candidates for international markets with World Bank support. Assisted a trough developer in receiving World Bank support (up to $50 million) for a Mexican government parabolic trough project. Assist industry in the evaluation of a hybrid 100 MW power tower plant to support a coal plant in Rajahstan, India.

1113

- INDUSTRY SECTOR ($5,024)

Solar Detoxification ($2,777)

-- With ongoing technical assistance from DOE focused on efficiency improvements, the first commercial application of the photocatalytic oxidation process will be introduced by International Technology Corp. This application is likely to be the remediation of soil and groundwater contaminated from leaking fuel tanks.

-- Field tests at refinery and electronics facilities will be completed to show the effectiveness of the photocatalytic process in bringing industrial processes with environmental regulations. These experiments will assist International Technology and SolarChem in their efforts to commercialize the technology.

Solar Industrial Processes ($2,247)

III. Performance Summary: SOLAR THERMAL R&D (Cont'd)

-- Cooperative solar process heat projects begun in FY95 will be completed.

-- An industry-led team composed of solar manufacturers and their potential industrial and commercial customers will develop a strategy for making the technology suitable for targeted process heat markets.

-- Cooperative research activities searching for new industrial applications of solar energy will be terminated.

FY 1997 Planned Accomplishments:

* UTILITY SECTOR ($23,750)

Thermal Systems Research ($5,800)

-- Solar Thermal R&D - Complete testing of stretched-membrane heliostats at Solar Two site. Continue to refine canting procedures, cleaning techniques, and more clearly define O&M costs. Install second-generation hybrid (solar/natural gas) reflux receivers on 25-kW dish/Stirling systems for field testing. Enter 3rd year of optical materials outdoor testing. Continue Solar Two technical support and research related to hybrid receivers. Continue life-cycle testing of Stirling and Brayton dish/engine systems on-sun.

Power Applications Research ($17,950)

-- Utility-Scale Dish/Stirling - Deploy 5 second generation 25-kW dish/Stirling systems at a grid-connected site in Southern California. This will validate the design, performance, and availabilty of the systems. SAIC and Cummins plan to deploy 3 MW of 25-kW dish/Stirling systems at this site in the following year. This site, dubbed the "Mini Solar Enterprise Zone" will serve as a center for international representatives to assess the technology for commercial export.

-- SolMat - Design and build two sets of pre-commercial heliostats for testing and evaluation. Continue the technology evaluation of an advanced state-of-the-art receiver and a composite concentrator.

-- Design Assistance & Program Support - Perform systems analyses and provide technical assistance to users of power tower, dish/engine, and parabolic trough technologies. Provide technical support for a proposal to the World Bank for a 100 MW power tower in India. Provide evaluation and analysis for potential 50 MW hybrid trough plant in Mexico. Provide support for the California Energy Commission

III. **Performance Summary**: SOLAR THERMAL R&D (Cont'd)

Initiative for six renewable energy prison heating systems.

- INDUSTRY SECTOR ($0)

No activities are planned for FY 1997.

Explanation of Funding Changes FY 1996 to FY 1997

The decrease of $ 968,000 in Thermal Systems Research will reduce follow-on R&D for one concentrator system and reduce investment in developing durable polymer optical materials.

The increase of $ 5,472,000 in Power Applications Research includes:

Dish/Stirling Projects - The increase of $1,610,000 will provide cost-shared funds for the initial testing of pre-commercial systems at a grid-connected site in Southern California. This site will be used for the deployment of 3 MW of dish/Stirling systems in 1998. This deployment will provide the critical stepping stone for the commercial success of dish/engine technology.

SolMat - The increase of $2,051,000 will provide cost-shared funds to design and build two sets of pre-commercial heliostats for testing and evaluation, and continue the technology evaluation of an advanced state-of-the-art receiver and a composite concentrator.

Design Assistance & Program Support - The increase of $1,811,000 will provide 1) for the performance of systems analyses, 2) technical assistance to users of power tower, dish/engine, and parabolic trough technologies, and 3) additional support for the California Energy Commission Initiative for six renewable energy prison heating systems.

The decrease of $ 2,777,000 in Solar Detoxification will effectively terminate the program.

The decrease of $ 2,247,000 in Solar Industrial Processes will effectively terminate the program.

BIOFUELS

I. Mission Supporting Goals and Objectives:

The mission of the Biofuels R&D Program is to provide the technology base necessary for developing cost-competitive systems that can produce energy from biomass. Biomass feedstocks include agricultural residues and forestry wastes, such as rice straw/husks and sawdust, municipal solid waste, and trees and grasses grown specifically for their energy content. Biomass energy can provide products for three major world markets: electric power generation, transportation fuels, and chemical and textile production; and has the potential to provide approximately 33% of the total U.S. energy needs in these markets. Biomass energy systems can also provide substantial environmental benefits. Because bioenergy crops absorb carbon during growth, their use for transportation fuels or electricity production results in near zero net carbon release. When these fuels are used to displace traditional fossil fuels, significant emission reductions of the oxides of sulfur and nitrogen (SOx and NOx) can also be achieved. In addition, since biomass is domestically produced and is renewable, it offers significant opportunities for job creation, rural economic development, job creation, and alternative crop production opportunities for farmers (which can result in a further reduction of federal agricultural subsidy payments).

The goal of the Biofuels R&D Program is to develop low-cost biomass energy feedstock systems and cost effective, efficient conversion technologies for power generation and liquid fuel and chemical markets, and increase biofuels and biopower production capabilities. Associated objectives are to:

1. develop bioenergy crops and production methods to provide reliable, low-cost biomass feedstocks.

2. develop biomass conversion and processing technologies.

3. demonstrate biomass energy technologies.

The Biofuels R&D Program includes integrated activities from DOE's utility, industry, and transportation sectors.

I. Mission Supporting Goals and Objectives: BIOFUELS (Cont'd)

BIOMASS POWER R&D - UTILITIES

1.A. Program Description

The mission of the Utility Sector Biomass Power R&D Program is to assist in the development and demonstration of high-efficiency biomass power conversion technologies integrated with highly productive energy feedstocks. The goals of the program are to: (1) advance the state-of-the-technology to a point where integrated biomass power systems are cost-competitive with conventional power technologies, and (2) support industry efforts to commercialize these technologies by 2004 through cost-shared projects.

The Utility sector program focuses on research development, and proof-of-concept activities for thermochemical conversion technologies to produce cost-competitive electricity from biomass for utility applications. These efforts include low cost cofiring applications and retrofitting conventional power plants to employ renewable biomass resources. Additional efforts will focus on demonstrating next-generation high efficiency technologies (i.e., gasification/gas turbine, advanced direct combustion) at first-of-a-kind project sites. Currently, biomass electric generating capacity totals over 7,000 MW, consisting primarily of traditional thermal systems using biowaste materials or by-products. Specific program goals include research and development of biomass electric conversion technologies capable of producing electricity for 4-1/2 to 5 cents/kilowatt-hour by 2004 (the current cost is 7 cents/kilowatt-hour). Biomass electric conversion, in addition to being a low-cost renewable baseload electric generation strategy, also offers economic development and job creation benefits in rural areas through the production of dedicated feedstocks for these systems. It also provides for ecological diversification with environmental benefits to farm lands. The "Biomass Power for Rural Development" Program provides for cofiring, gasification and/or direct combustion customer-driven and cost-shared project opportunities with both agriculturally-based consortia and the pulp-and-paper industry. In addition, research and analysis relating to restructuring in the electric utility industry will be conducted on issues associated with integration of Biomass Power systems into an increasingly competitive industry framework. Additional fundamental research on resource characteristics will identify cost-competitive options for systems integration.

1.B. Estimate of Benefits

The currently installed biomass power generating capacity stands at approximately 7,000 MW. It is expected that by 2000, up to an additional 2,000 MW will be installed. By 2010, it is predicted that 8,000 MW of new capacity additions will be added, growing to a total of 30,000 MW of newly installed capacity by 2020. This growth will be experienced in several market segments, including biomass cofiring at existing coal-fired facilities, greatly increased energy export from the pulp and paper industry, and most dramatically by new

I. Mission Supporting Goals and Objectives: BIOFUELS (Cont'd)

integrated biomass power system deployments in rural areas aimed at capturing environmental and economic benefits to be afforded by these systems. This dramatic growth will be facilitated by the development and demonstration of high-efficiency, advanced technology biomass power systems which will be achieved in the first decade of the next century. The following table summarizes the program's benefits.

	2000	2010	2020
Annual Primary Energy Displaced	0.09 Q	0.43 Q	1.86 Q
Annual Displaced Electricity Value ($0.07/kWh)	$630 M	$3,039 M	$13,026 M
Carbon Equivalent Emissions Reductions	2.03 MMT	8.91 MMT	36.62 MMT

1.C. Performance Measures

Two advanced concept gasification systems are being validated for performance and availability in the late 1990s. In addition, at least 4 partnerships for pre-commercial plants will be initiated through the Program's "Biomass Power for Rural Development" initiative and will be on-line producing 175 MW(e) of power from dedicated feedstocks by 2001. These projects will establish the baseline for the future deployment of economically feasible, integrated biomass power projects.

Biomass Power Program sponsored research and development advances will be incorporated into biomass electric conversion technologies enabling electricity production using dedicated feedstocks for 4 1\2 to 5 cents/kilowatt-hour-by 2004. The following performance measures apply:

1996 Performance Measures

Complete long-duration testing of the direct gasifier at the Hawaii Biomass Gasifier Facility (a major technical milestone). This test concludes Phase 1 of the project.

Make awards and initiate at least four integrated biomass power projects through the "Biomass Power for Rural Development" solicitation. These new project partnerships will engage at least 15 new partners in the Biomass Power Program and leverage commitments for at least $100M of private-sector cost share over the life of the projects (FY 1996-2001).

1997 Performance Measures

Complete construction of the commercial-scale gasifier installation at the Vermont Project (a major project

I. **Mission Supporting Goals and Objectives**: BIOFUELS (Cont'd)

milestone).

Complete operational testing of the commercial-scale gasifier and conduct gas analysis of the Vermont Project installation (a major technical milestone). This concludes Phase II of the project.

Incorporate a high efficiency, 15 MW(e) gas turbine into the Vermont gasifier system.

Complete Phase I (detail design engineering and permitting) of the four "Biomass Power for Rural Development" projects (major project milestone).

To further expand the potential applications of high efficiency biomass gasification technologies, operation of a gasifier/fuel cell arrangement will be demonstrated.

1998-1999 Performance Measures

Complete total system operational testing of the gasifier/gas turbine configuration and conclude coupling of the new turbine generator with the gasifier for the Vermont Project. Completion of this phase will operationally demonstrate the feasibility of high efficiency, biomass gasification/gas turbine systems (a major accomplishment for the Program). Progression through Phase III will secure the major portion ($9M) of the private sector partner's total cost-share contribution ($13.5M) in this project.

Thermochemical Conversion

-- Through collaborative efforts with the Advanced Turbine System (ATS) Program, "ruggedized" gas turbine blades will be developed, which will enhance the operational durability of gas turbines in biomass gasification applications. These developments will greatly improve the efficiency and cost-competitiveness of integrated gasification/gas turbine systems by expanding the availability of these highly efficient components.

Systems Development

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Incorporate a gas turbine into the Vermont Gasifier System and complete full-scale gasification/gas turbine testing. This will conclude Phase III of the project and prove the technical viability of indirect gasification/gas turbine technology.

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Demonstrate cofiring of dedicated

I. Mission Supporting Goals and Objectives: BIOFUELS (Cont'd)

energy crops (willow) with coal in a commercial application through the collaborative DOE/USDA "Biomass Power for Rural Development" initiative.

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Demonstrate a fuel cell operating on switchgrass in a commercial application through the collaborative DOE/USDA "Biomass Power for Rural Development" initiative.

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Demonstrate a 50-75 MW (e) advanced combustion or gasification/gas turbine project fueled by dedicated energy crops through the "Biomass Power for Rural Development" initiative.

BIOFUELS - INDUSTRY

1.A. Program Description

The Industry Sector Biofuels activities consist of the Municipal Solid Waste Program (MSW) and the Advanced Turbine Systems (ATS)/Biomass for Cogeneration program.

Due to higher program priorities, the Municipal Solid Waste (MSW) program is not funded in FY 1997. However, in FY 1995 and FY 1996, the program addressed the following: It is estimated that we spend $30 billion per year to manage our trash, and over the last decade these costs have increased faster than inflation. The costs to communities are expected to increase rapidly in the foreseeable future because of the Clean Air Act Amendment and mandates/goals for high levels of recycling in many communities by the end of the century. These wastes offer a significant opportunity to conserve both non-renewable fossil energy and material resources, and to reduce the emissions of potent greenhouse gases and volatile organic compounds from landfills.

The goal of the ATS/Biomass for Cogeneration project is to allow biomass derived fuels to be burned in a cogeneration plant using a combustion turbine. Switching from clean natural gas to biomass fuels in combustion turbines is a significant challenge. The biomass derived fuels contain corrosive species which rapidly degrade gas turbine performance. Cogeneration is the efficient production of two forms of energy (electricity and steam) from the same fuel source using the exhaust from one system as the input for the other. Cogeneration system efficiencies can reach as high as 90%, a significant improvement over 35% efficiency when the production of steam and electricity are separated. To reach the goal requires development in two critical areas; gas clean-up and ruggedizing the turbine to improve corrosion and erosion resistance.

I. **Mission Supporting Goals and Objectives**: BIOFUELS (Cont'd)

1.B. Estimate of Benefits

The use of MSW technology could significantly reduce the amount of greenhouse gases (estimated at 4% of the total national emissions in carbon equivalents), displace up to 1 quad of fossil energy by 2020, and provide secondary raw materials now discarded. Beyond 2030, it offers the potential of eliminating landfill as a major MSW disposal method or a significant source of methane emissions and non-methane volatile organic compounds.

An ATS/Biomass for Cogeneration system will be more cost-effective, more efficient, and environmentally cleaner than a conventional biomass-fueled power generation system. Cogeneration system efficiencies can reach as high as 90%.

The following benefits are estimated from the Industry Biofuels activities of Biomass For Cogeneration:

	2000	2010	2020
Energy Savings (quad/year)	.02	.05	1
Cost Savings ($M/year)	75	325	700
Carbon Reduction (Million ton/year)	1.9	3.8	5.2

1121

1.C. Performance Measures

The goals of the Industrial Biomass program are to increase the use of municipal solid waste (MSW) as an economical and environmentally sound fuel or materials source; to allow biomass-derived fuels to be burned in a combustion turbine; and to develop advanced technologies for reducing costs in the textile industry.

The following performance measures will be used by the Industry sector's biomass programs:

FY 1996 Performance Measures

-- State and local governments will increase their use of ash to help them attain mandatory waste diversion rates.

-- MSW Program activities will be terminated with the least adverse impact to DOE's partners.

I. Mission Supporting Goals and Objectives: BIOFUELS (Cont'd)

-- Complete 2 studies on converting combustion turbines from natural gas to biomass-derived fuels.

FY 1997 Performance Measures

-- Because there will be no MSW funding after FY 1996, performance measures will rely on industry's success in commercializing technologies that were developed under partnership with the Municipal Solid Waste program.

-- Complete studies into gas clean-up requirements for combustion turbines.

-- Initiate design, testing and manufacture of combustion turbine components for biomass cogeneration applications.

FY 1998 (and Beyond) Performance Measure

-- Biomass for Cogeneration will demonstrate a combustion turbine that will be adaptable to biomass-derived fuels in 2000.

BIOFUELS - TRANSPORTATION

1.A. Program Description

The Biofuels-Transportation program is a key component in the Department's transportation strategy to reduce the nation's growing dependence on imported oil by providing the science and technology for a domestic, environmentally sustainable, alternative transportation fuel. For biofuels in the transportation sector, a comprehensive analytical strategic planning effort is used to identify the most promising biofuel options and technology gaps. Based on the analysis, the program focuses on the production of ethanol, an important alternative fuel option. Specific program goals include research and development of technology for producing ethanol for less than $1.00/gallon by 2000 from low-cost waste feedstocks and for $.67 per gallon by 2010 from bioenergy crops. The current estimated production cost is $1.22 per gallon.

The program focuses on research, development, and demonstration of feedstock production systems to develop bioenergy crops and biochemical conversion systems for the production of ethanol. The objective of the feedstock production activity is to develop highly productive woody and herbaceous energy crops for U.S. regions capable of supporting large-scale production systems, with regional crop development centers coordinating the research. Biochemical conversion objectives are to integrate technologies currently

I. **Mission Supporting Goals and Objectives**: BIOFUELS (Cont'd)

developed at the laboratory- and bench-scales for waste feedstocks into complete processes in the existing DOE/NREL 1-ton per day process development unit, providing reliable engineering, performance, and cost data for designs of larger scale demonstration and commercial facilities. Research will be continued to develop high-efficient, low-cost conversion technologies, such as genetic engineering methods to increase enzyme reactivity, reduce reaction times, and/or improve process efficiencies for converting bioenergy crops.

The Regional Biomass Energy Program transfers current and reliable information to potential biofuel energy users. Emphasis is placed on information and technologies best suited to near-term use, and includes economic and technical information as well as regulatory, environmental, and market considerations. Regional activities are coordinated with existing organizations, including Federal and State agencies, universities, private industry, associations, and other groups involved in furthering the use of biomass-to-energy applications. Each Region issues competitive solicitations to perform applied research and engage in cost-shared projects to demonstrate applications of biomass technologies; reduce or eliminate market barriers; understand economic and environmental costs, benefits and risks; and accelerate market acceptance of biomass technologies.

1.B. Estimate of Benefits

	2000	2010	2020
Primary Energy Displaced (Quads)	0.03	0.87	1.27
Primary Oil Displaced (MBPD)	0.01	0.41	0.60
Energy Cost Savings($B)	0.0	0.08	1.05
Carbon Reductions (MMTons)	0.57	15.7	18.8

1123

1.C. Performance Measures

The transportation biofuels program has established two principal goals together with the performance measures listed subsequently. By 2000, in collaboration with industry partners, produce ethanol from low-cost cellulosic waste materials, at a cost of $0.90 per gallon, using biochemical conversion technology, to displace 0.01 mbpd of oil.

By 2010, produce ethanol at a cost of $0.67 per gallon, from bioenergy crops, and reduce petroleum use by .41 mbpd and greenhouse gases by 15.7 million metric tons of carbon. The cost trend is shown in the following table:

I. Mission Supporting Goals and Objectives: BIOFUELS (Cont'd)

Cost Parameters
Biofuels-Transportation

	1985	1996(now)	2000	2010
Ethanol cost $/gallon*	3.80	1.22	0.90	0.67

* Based on feedstock costs of $2/MMBTU ($34/ton hybrid poplar, $26/ton switchgrass).

FY 1995 Performance Measures

-- Industry planted 50,000 acres of hybrid poplar clones developed for the Pacific Northwest by the program.

-- Completed operational shakedown of the one ton per day biomass to ethanol process development unit.

-- Received R&D 100 Award for development of organism capable of converting two major sugar components of cellulosic feedstock.

FY 1996 Performance Measures

-- Complete pilot-scale tests with Amoco Corporation to provide reliable scale-up operational and cost data for demonstration and small commercial ethanol facilities.

-- Complete feasibility study/business plan for rice straw project, in partnership with the City of Gridley, California, and its industrial team.

FY 1997 Performance Measures

-- Cost share research project with major paper company to develop information that will assist in the identification of soil types and their locations for hybrid poplar crops in the South.

-- Define best locations for supplying switchgrass feedstocks at a low cost at five different demand levels and the number of facilities that could be supported in six Midwest/Lake States.

-- Complete engineering design and initial construction of engineering demonstration unit or small-scale commercial biomass to ethanol unit with cost-sharing industry partner to be integrated into an existing

I. **Mission Supporting Goals and Objectives:** BIOFUELS (Cont'd)

facility.

FY 1998 - 1999 Performance Measures

-- Identify and begin optimization of biomass pretreatment methods capable of making mixed feedstocks, such as wastes and switchgrass, more amenable to biochemical conversion to ethanol.

-- Demonstrate full process of ethanol production from sawdust or other feedstock of industry interest at the pilot-plant scale.

-- Make available two new fully tested clones of hybrid poplar, specifically adapted for the Midwest/North Central U.S., for demonstration/commercialization by the private sector.

-- Establish ten switchgrass variety test sites for a total of thirty sites in the Southeast U.S., and five new variety tests in the Midwest/Lake States.

II. **Funding Schedule:**

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Biomass Power R&D - Utilities					
Thermochemical Conversion	$ 2,296	$ 2,125	$ 2,790	$ 665	+ 31
Systems Development	11,901	18,437	32,560	14,123	+ 77
Subtotal, Biomass Power R&D - Utilities	$ 14,197	$ 20,562	$ 35,350	$ 14,788	+ 72
Biofuels - Industry					
Municipal Solid Waste	$ 1,501	$ 1,760	$ 0	$ -1,760	-100
Biomass for Cogeneration	0	1,153	5,000	3,847	+334
Subtotal, Biofuels - Industry	$ 1,501	$ 2,913	$ 5,000	$ 2,087	+ 72
Biofuels - Transportation					
Feedstock Development	$ 4,950	$ 5,000	$ 6,050	$ 1,050	+ 21
Biochemical Conversion	22,435	19,610	32,490	12,880	+ 66
Thermochemical Conversion	4,515	1,775	0	-1,775	-100
Regional Biomass Energy Program	4,742	3,811	2,000	-1,811	- 48
Subtotal, Biofuels - Transportation	$ 36,642	$ 30,196	$ 40,540	$ 10,344	+ 34
Total, Biofuels	$ 52,340	$ 53,671	$ 80,890	$ 27,219	+ 51

III. **Performance Summary**: BIOFUELS

FY 1995 Accomplishments:

- BIOMASS POWER R&D - UTILITIES ($14,197)

  Thermochemical Conversion ($2,296)

  -- Successfully tested bagasse and other feedstocks in hot-gas cleanup systems developed by Westinghouse on 10 ton/day gasifier in Hawaii. Eliminated the need for tar-cracking of the gas stream.

  -- Completed characterizations of gases from two gasifiers fueled with bagasse, switchgrass and wood feedstocks. Operated a small turbine and fuel cell with these gases (the world's first operational demonstrations of these components fired by biomass gases).

  -- Decreased alkali metal content in biocrude oil by two orders of magnitude to ensure compatibility with diesel engines.

  -- Installed a modified, small-scale hot-gas cleanup system on the Hawaii biomass gasifier.

  Systems Development ($11,901)

  -- CLIMATE CHANGE ACTION PLAN: Partnership for Technology Introduction: Completed construction of the direct gasifier at Hawaii ($2,454)

  -- CLIMATE CHANGE ACTION PLAN: Partnership for Technology Introduction: Completed the design and initiated construction of the indirect gasification/gas turbine development project in Vermont. ($5,677)

  -- Completed 10 feasibility studies investigating the costs associated with deploying integrated biomass energy projects.

  -- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Issued collaborative DOE/USDA "Biomass Power for Rural Development" solicitation. Responses representing organizations from 25 states were received, proposing the deployment of up to 1000 MW of biomass power projects, utilizing up to 250,000 acres of land to produce dedicated energy feedstocks. ($685)

  -- Successfully demonstrated a 1 MW(e) direct-fired gas turbine plant which operates on sawdust.

  -- Completed geographic information system resource studies for 11 states to aid in identifying

III. **Performance Summary**: BIOFUELS (Cont'd)

locations of cost-competitive biomass resources in additional regions of the country.

-- Continued ongoing biomass systems analysis and design assistance/outreach efforts to assist existing biomass-fueled boiler operators.

- BIOFUELS - INDUSTRY ($1,501)

Municipal Solid Waste ($1,501)

-- Started design of commercially sized (10,000 gallon) high solids anaerobic digester for testing the combined disposal of biodegradable fraction of municipal solid waste with tuna sludge.

ATS/Biomass for Cogeneration ($0)

-- No Activities.

- BIOFUELS - TRANSPORTATION ($36,642)

Feedstock Development ($4,950)

-- Terrestrial Corps: Hybrid poplar clones, developed as a model tree energy crop by contractors of DOE, have been commercially planted on 50,000 acres in the Pacific Northwest. Activities continued to replicate this successful integrated feedstock development program in the Midwest and Southeast with poplars and in the Northeast with hybrid willows. A new breeding project was initiated in the Southeast with hybrid poplars. Switchgrass, the model herbaceous crop, is being developed in the Southeast, Lake States, Appalachia, and Plains States. These perennial tree and grass crops have significant advantages from an environmental perspective when compared to most annual crops cultivated under conventional agricultural systems. These feedstock crops can be used to produce fuels, electricity, chemicals, and fiber. The development of these feedstock technologies is critical to the development of a large-scale biomass industry.

-- Aquatic Crops: A patent was awarded for the introduction of multiple copies of the acetyl-CoA carboxylase (ACCase) gene into two different microalgae. ACCase is the key gene for the production of lipids from microalgae for biodiesel production. A multifunctional gene was isolated and cloned which may provide another avenue for metabolic enhancement of microalgae lipid production. Increased lipid production coupled with high biomass production rates is essential to the cost-effective production of biodiesel form microalgae.

III. **Performance Summary**: BIOFUELS (Cont'd)

Biochemical Conversion ($22,435)

-- The co-fermenting bacterium Zymomonas mobilis was improved by genetically engineering the genes needed to enable the organism to ferment xylose, glucose and arabinose, the third most abundant sugar found in lignocellulosic feedstocks, increasing the yield of ethanol and reducing the time required for reaction, thus reducing the associated costs. The development of the co-fermenting organism has resulted in the prestigious R&D 100 award from R&D magazine, for being one of the top 100 inventions in 1995. The bacterium Streptomyces lividians was successfully genetically engineered to produce two of the three required cellulase enzymes needed to break down cellulose. When supplemented with a third enzyme, a workable "engineered" artificial cellulase system could increase yields and reaction rates, and reduce capital costs for the production of ethanol. Seven cost-shared research and development projects were supported under the Consortium for Plant Biotechnology Research. These projects were conducted at six universities in Wisconsin, Illinois, Indiana, Michigan, Connecticut and Nebraska, resulting in a 50 percent industrial cost share of longer-term research for the production of energy from biomass. Operational shakedown of the one-ton/day process development unit (PDU) was completed and feedstock testing with a CRADA partner was initiated. Criteria for evaluating cost-shared ethanol plant siting studies were developed.

Thermochemical Conversion ($4,515)

-- The thermochemical process development unit was designed and constructed to provide for integrated biofuels testing. The BioSyngas Combination Synthesis Unit (BSCU) was designed and constructed. The BSCU will provide the capability to test a large number of catalysts using process syngas. A preliminary carbon dioxide and energy balance for soy and microalgae biodiesel was completed.

Regional Biomass Energy Program ($4,742)

-- Assistance was provided in developing State and local government and industry capabilities to produce and use biomass resources. Efforts to assess bio-resource availability were supported. A biogas recovery system capable of generating 26 kw or 80 percent of the electrical power needs of the adjacent farm was designed and installed. The cost-shared system saves the farm an estimated $10,000 annually in energy bills.

III. **Performance Summary**: BIOFUELS (Cont'd)

FY 1996 Accomplishments (to date and planned):

- BIOMASS POWER R&D - UTILITIES ($20,562)

  Thermochemical Conversion ($2,125)

  -- Complete gas characterizations for indirect gasifiers.

  -- Initiate fuel cell collaborative development program using biogas products from an existing gasifier.

  -- Implement and test improved hot-gas filtration system to ensure compatibility with high temperature turbines and/or diesel engines.

  Systems Development ($18,437)

  -- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Successfully demonstrate operation of the Hawaii Gasifier, and complete long duration testing with the hot-gas cleanup system. ($3,685)

  -- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Continue construction of the indirect gasifier installation at Vermont. ($7,983)

  -- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Initiate 4 Integrated Biomass Power Projects through the collaborative DOE/USDA "Biomass Power for Rural Development" solicitation. Completed detailed engineering design and permitting for these projects. One cofiring project has commenced facility modifications/construction at an existing coal-fired plant to facilitate biomass processing/handling/combustion. ($5,332)

  -- Continue direct-fired gas turbine development, geographical information survey data-base development, and biomass systems analysis, design assistance and outreach efforts. ($1,437)

- BIOFUELS - INDUSTRY ($2,913)

  Municipal Solid Waste ($1,760)

  -- Completed construction of the high solids anaerobic digester in California. Operation and evaluation of the digester is begun. Successful demonstration will lead to the commercialization of the high solids

III. Performance Summary: BIOFUELS (Cont'd)

technology, producing a clean burning fuel gas for electricity production.

-- Compile data and develop guidance document on the beneficial use of combustion ash. This will provide a technical basis for the increased use of the ash and result in reducing costs associated with recovery of energy from waste and other materials (i.e. paper, plastic, and wood) and assist state and local governments in meeting mandatory waste diversion rates by diverting the materials from landfills.

-- All other tasks will be terminated by the end of the year.

ATS/Biomass for Cogeneration (New Start) ($1,153)

-- Completed 2 studies on converting combustion turbines from natural gas to biomass.

-- Initiated development of thermal barrier coatings and improved airfoil castings that will have increased corrosion resistance, cost, life and ease of fabrication.

- BIOFUELS - TRANSPORATION ($30,196)

Feedstock Development ($5,000)

-- Terrestrial Crops: Research will continue to develop economically viable model energy crops at integrated biomass feedstock crop development centers in the Pacific Northwest (poplars), Southeast (switchgrass), and Midwest/Plains States (switchgrass and poplars). Increased support for hybrid willow in the Northeast should lead to viability studies. A mechanization steering committee will promote collaborative research and development to lower harvesting/handling costs, a major obstacle to widespread use of short rotation systems for energy applications.

-- Aquatic Crops: Conduct activities for the orderly termination of this research area.

Biochemical Conversion ($19,610)

-- A multi-year program plan for the Ethanol Project is being developed, that will be peer reviewed and integrated with feedstock development activities. Research and development of Zymomonas mobilis at integrated bench scale will be completed, leading to testing for optimal conditions for using the co-fermenting organism on several relevant feedstocks. Research and development of the newly-developed arabinose-fermenting organism at the integrated bench scale will be initiated. Genetic engineering of Streptomyces lividans to produce the third cellulase enzyme, will be competed, creating the improved

III. **Performance Summary**: BIOFUELS (Cont'd)

artificial cellulase system and optimization will begin on relevant feedstocks. The process development unit (PDU) will be operated continuously in a fully integrated process mode (feedstock to ethanol). The PDU will be operated to evaluate handling, pretreatment, fermentation, and process efficiency for selected feedstocks, including those having environmental implications, such as rice straw which poses a disposal problem in California and other rice-growing areas. A feasibility study/business plan will be conducted in partnership with the City of Gridley, California, and its industrial team. Cost-shared, long-term research and development projects will continue to be supported under the Consortium for Plant Biotechnology Research with a 50:50 cost-shared requirement.

Thermochemical Conversion (1,775)

-- The thermochemical process development unit (TPDU) will be commissioned and operated at steady state to produce methanol. The BioSyngas Combination Synthesis Unit will be integrated and operated with the TPDU. Necessary activities will be conducted for the orderly close-out of work to produce transportation fuels, using thermochemical conversion processes. A soy biodiesel fuel cycle analysis, in collaboration with USDA, EPA, and other stakeholders, will be completed.

Regional Biomass Energy Program ($3,811)

-- Work will continue with State and local governments and industry to develop capability to produce and use biomass resources.

FY 1997 Planned Accomplishments:

- BIOMASS POWER R&D - UTILITIES ($35,350)

Thermochemical Conversion ($2,790)

-- Complete technology development of hot-gas filtration system, with demonstration on the Hawaii Gasifier.

-- Operate a gasifier with a fuel cell.

Systems Development ($32,560)

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Incorporate the full-scale Hot-Gas Cleanup unit into the Hawaii Gasifier Facility, and complete system operational testing. These

III. Performance Summary: BIOFUELS (Cont'd)

demonstrations of gasifiers and gas cleanup components will establish the commercial availability of advanced American biomass power technologies. ($2,923)

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Complete construction and operationally demonstrate the commercial-scale indirect gasifier at the Vermont Gasification Project. ($5,846)

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Initiate facility construction at the four integrated biomass power projects (part of the collaborative DOE/USDA "Biomass Power for Rural Development" program). One of the integrated cofiring projects will complete facility modifications, and conduct test burns, in anticipation of full-scale operations this fiscal year. Award two to three additional advanced technology biomass power projects through the "Biomass Power for Rural Development" program, to include additional advanced gasification/direct combustion systems. This provides for a broad base of advanced American technologies, which will help assure near-term market success and enhance industry's ability to compete in the world market. Launch a cooperative effort with USDA aimed at deploying an integrated flood plain management/energy crop development strategy. Initiate a cooperative effort with EPA aimed at better utilizing existing solid waste products to enhance energy crop yields through integrated composting strategies. ($21,462)

- BIOFUELS - INDUSTRY ($5,000)

Municipal Solid Waste ($0)

-- Evaluation of the digester will be completed using prior year funding. Completion of this activity will terminate the MSW program.

ATS/Biomass for Cogeneration ($5,000)

-- Initiate studies into the development of gas clean-up systems.

-- Continue development of thermal barrier coatings and improved combustion turbine airfoil castings that will have increased corrosion resistance, cost, life and ease of fabrication.

-- Commence design, manufacture, and testing of components for a combustion turbine that will be adaptable to biomass-derived fuels in 2000.

- BIOFUELS - TRANSPORTATION ($40,540)

III. Performance Summary: BIOFUELS (Cont'd)

Feedstock Development ($6,050)

-- Terrestrial Crops: Switchgrass scale-up test plantings will be established in the North Central region and Southeast to provide reliable scale data and information on yield, production, cost, and other parameters. Sites in six Midwest States with high potential for short rotation woody crops will be identified, based on the Midwest/Southeast Geographical Information Systems (GIS) study. Genetic markers will be identified that can be used to select hybrid poplar seedlings that are less susceptible to major poplar disease, reducing the risk of mortality and increasing technical/economic viability.

Biochemical Conversion ($32,490)

-- The co-fermenting organism, Zymomonas, will be tested in the PDU integrated process on biomass wastes and residues, and the newly developed genetically engineered organism capable of fermenting all available sugars will be tested at the integrated bench scale. The PDU will be operated to develop data and research process efficiencies using relevant feedstocks with significant potential for ethanol production. The three cellulase enzymes will be expressed in a single organism and an improved Acidothermus cellulase mutant enzyme will be developed by protein engineering and characterized. In the laboratory, the development of organisms capable of combining the two enzymatic process steps (cellulose conversion and fermentation) into one step will continue. The conceptual design for an engineering demonstration unit will be nearing completion, using agricultural waste, such as rice straw and corn fiber, to produce ethanol. Fifty/fifty cost-shared research and development projects will continue under the Consortium for Plant Biotechnology Research.

A first-of-a-kind demonstration of cellulosic biomass technology is acutely needed. This can be accomplished through a project that brings engineering and investment partners to this commercialization project, and validates the use of agricultural wastes to produce ethanol. This initiative will demonstrate the benefits of this technology to the investment community, while meeting environmental and security objectives.

Industrial partnerships will also be aggressively pursued to mass produce enzymes. The production of low-cost enzymes will be accomplished by developing advanced cellulase systems that result in higher productivity or improved manufacturing processes of new and/or more active enzymes. Low-cost cellulases are critical to the continued growth of the cellulosic biomass to ethanol industry beyond waste feedstocks.

Thermochemical Conversion ($0)

III. Performance Summary: BIOFUELS (Cont'd)

-- No Activities.

Regional Biomass Energy Program ($2,000)

-- The national regional program structure, including State representation where feasible, will be maintained at a reduced level. Highest priority activities will be pursued in such areas as liquid fuels development, co-firing of waste wood to produce electricity, and methane production from wood and agricultural waste streams.

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 665,000 in Thermochemical Conversion (Utilities) will allow the program's scope to include collaborative efforts with the Advanced Turbine System (ATS) Program, with a principal mission of developing "ruggedized" gas turbine blades for biomass systems.

The increase of $ 14,123,000 in Systems Development (Utilities) will allow four projects to be selected through the collaborative DOE/USDA "Biomass Power for Rural Development" initiative to enter into the construction phase. Additionally, the number of industry cost-shared projects is expected to include an additional two to three projects. The inclusion of these additional projects will leverage more than $100,000,000 of private sector capital.

The decrease of $ 1,760,000 in Municipal Solid Waste (Industry) effectively terminates the program in FY 1997 due to higher program priorities.

The increase of $ 3,847,000 in Biomass for Cogeneration (Industry) supports the design, manufacture, and testing of combustion turbine components that will allow for conversion from natural gas to biomass gaseous fuels in cogeneration applications.

The increase of $ 1,050,000 in Feedstock Development (Transportation) will be used to support short rotation woody crops research in the Northcentral, Northeast, South, and Pacific Northwest. The genetics development and scale-up of an herbaceous bioenergy crop, switchgrass, will also be supported.

The increase of $ 12,880,000 in Biochemical Conversion (Transportation) will be used to bring together engineering and investment partners to cost share a first-of-a-kind demonstration of cellulosic biomass-to-ethanol technology at one more sites (DOE total available: $9,880,000). The estimated cost for these demonstrations range from $30 million to $50 million depending on the size and site selected.

III. Performance Summary: BIOFUELS (Cont'd)

DOE's share will not exceed 20 percent. The increase will also promote one or more partnerships with biotechnology and/or enzyme production firms to develop and mass produce low-cost biocatalysts (DOE total available: $3,000,000).

The decrease of $ 1,775,000 in Thermochemical Conversion (Transportation) will eliminate thermochemical conversion of biomass to produce a variety of versatile liquid fuel products through gasification/fuel synthesis and fast pyrolysis/catalytic cracking.

The decrease of $ 1,811,000 in Regional Biomass Energy Program (Transportation) will eliminate the annual solicitation for proposals for the five Regions to demonstrate biomass technologies that are matched by State funds.

WIND ENERGY R&D

I. Mission Supporting Goals and Objectives:

A. Program Description

The mission of the Wind Energy R&D Program is to establish wind energy as a regionally diversified, cost-effective power generation technology, through a coordinated research effort with industry and utilities that will minimize technical and institutional risks for U.S. companies competing in domestic and international markets.

Wind is an attractive energy source for several reasons: 1) wind generated electricity has the potential for serving as an inexpensive energy source for consumers and industries; 2) wind generated electricity produces no polluting emissions or other greenhouse gases; and 3) the international market for wind energy technologies is large and growing rapidly - buyers have already signed $300 million in purchase orders for new, state-of-the-art-wind turbine prototypes developed jointly by DOE and U.S. industry in 1994-95. By 2000, sales of wind energy technologies in the world market are estimated to reach $2-3 billion each year. While the U.S. wind industry is beginning to establish a foothold in this market, European and Japanese manufacturers continue to aggressively develop advanced technology and are expected to be increasingly competitive.

The Wind Energy R&D program conducts its research and development efforts to help U.S. industry gain a technological edge. The program focuses on Applied Research, Turbine Research, Cooperative Research and Testing, and Technology Deployment. The Applied Research program addresses fundamental engineering and technology issues with a broad range of applications and is carried out at several national laboratories and numerous universities. The Turbine Research program is a coordinated effort with industry and utilities which performs 50/50 cost shared research to develop the next-generation of wind turbines. The Cooperative Research and Testing program conducts R&D and prototype testing at the National Wind Technology Center in Colorado (opened in October 1994) which this year will be opening a world class user facility that will allow U.S. industries to expand testing of new wind energy technologies. The Technology Deployment program helps introduce utilities and other wind energy users to advanced wind turbine technologies and alternative approaches to wind energy deployment in the U.S. All four program elements work closely with the National Wind Coordinating Committee, a public/private partnership of producers, utilities, regulators, environmentalists and trade organizations organized in 1994.

I. Mission Supporting Goals and Objectives: WIND ENERGY R&D (Cont'd)

The Wind Energy R&D program has been extraordinarily successful in bringing down the cost of wind-generated electricity from 35 cents per KWh in 1980, to 7 cents per KWh in 1989, and 4 cents per KWh (in 15 mph winds) today. At current costs, wind energy is already competitive with conventional energy sources in selected markets on a life-cycle basis. Ultimately, wind energy will have to compete with gas- and coal-fired plants, which dominate the generation mix in the Midwestern U.S. where the majority of the country's good wind resource is located. To allow expansion of this large resource base, and to allow wind energy to be competitive in an era of utility restructuring that emphasizes low initial cost and independent power projects, significant improvements to the technology are still needed to reach the Program's goal of 2.5 cents per kWh in 15 mph winds by 2000. In addition, research and analysis relating to restructuring in the electric utility industry will be conducted on issues associated with integration of wind systems into an increasingly competitive industry framework. Additional fundamental research on resource characteristics will identify cost-competitive option for systems integration.

As wind technologies move closer to full commercialization, the Wind Energy R&D program intends to increase the private sector's share of R&D and demonstration project costs. For example, Federal support for Turbine Research is expected to decrease after FY 2000 as wind energy technologies become cost competitive with traditional power sources and as utilities and industry contribute an increasing percentage of funding for activities at the National Wind Technology Center.

B. Estimates of Benefits

At the proposed funding levels, the Wind Energy R&D Program is expected to yield the following quantifiable benefits:

	2000	2010	2020
Annual Primary Energy Displaced	0.05 Q	0.28 Q	1.45 Q
Annual Displaced Electricity Value ($0.07/kWh)	$376 M	$1,991 M	$10,142 M
Carbon Equivalent Emissions Reductions	1.19 MMT	5.84 MMT	28.51 MMT

Wind energy generating capacity installed in the U.S. currently totals over 1700 MW, is expected to grow to 3700 MW by 2000, and reach 10,000 MW by 2010. Wind energy emissions reduction impacts are enhanced by regional effects because much of the anticipated expansion will occur in the Midwest, where coal dominates the current generation mix.

C. Performance Measures (highlights):

I. **Mission Supporting Goals and Objectives**: WIND ENERGY R&D (Cont'd)

The following performance measures will be used by the Wind Energy R&D Program to track its commitment to meeting its year 2000 goal of producing electricity from wind energy for 2.5 cents per kWh in 15 mph winds:

1996 Performance Measures

-- Award 3 cost shared contracts (private sector cost share of $30 million for a total public/private investment of $60 million) to design and develop a new generation of wind turbines that will significantly reduce the cost of wind generated electricity;

-- Complete field tests of state-of-the-art turbines that will reduce technical and financial risks for utilities and industry; and

-- Complete the first blade fatigue test in the industrial user facility at National Wind Technology Center.

1997 Performance Measures

-- Initiate breakthrough research to establish design base for improved turbine technology for use in the 21st Century;

-- Conduct 10 industry tests, such as blade fatigue tests, at National Wind Technology Center's Industrial User Facility; and

-- Conduct full-scale design reviews on next-generation turbines (based on results of the 3 FY96 R&D contracts).

1998-99 Performance Measures

-- Test on two industry turbines an improved unsteady aerodynamic turbine model which allows variations in wind flow across and along a blade;

-- Complete prototype testing of next-generation wind turbines;

-- Complete breakthrough turbine technology study and present results to industry review group.

2000 Performance Measure

I. **Mission Supporting Goals and Objectives**: WIND ENERGY R&D (Cont'd)

-- Deploy fully tested advanced wind technologies capable of producing electricity at 2.5 cents per kWh in 15 mph winds.

Because wind moves intermittently in three dimensions and varies by terrain, the technological challenges of cost effectively capturing the wind resource are formidable. The Wind Energy R&D program focuses its R&D efforts on understanding how wind turbine blades may better capture the kinetic energy in winds which travel at varying speeds, and how the structures and components of wind turbines can be best designed for cost effectiveness and reliability. The discussion below briefly highlights accomplishments achieved or anticipated for each program element over the next several fiscal years:

II. **Funding Schedule**:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Applied Research	$ 8,000	$ 9,900	$ 15,200	$ 5,300	+ 54
Turbine Research	14,810	15,320	19,700	4,380	+ 29
Cooperative Research and Testing	7,715	6,331	8,201	1,870	+ 30
Technology Development	14,506	0	6,549	6,549	>999
Total, Wind Energy R&D	$ 45,031	$ 31,551	$ 49,650	$ 18,099	+ 57

III. **Performance Summary**: WIND ENERGY R&D

FY 1995 Accomplishments:

- APPLIED RESEARCH ($8,000)

  -- Completed the installation and testing of advanced, high efficiency rotor blade assemblies that will address many technology questions currently limiting wind turbine operation and performance.

  -- Completed fatigue load experiments for a small 10 kW variable speed turbine. This project will help industry design structurally reliable wind turbines to last 20 years.

III. Performance Summary: WIND ENERGY R&D (Cont'd)

-- Provided laboratory data collection equipment for research testing at the NWTC.

- TURBINE RESEARCH ($14,810)

-- Began prototype field testing (30-50% industry cost share) of three new turbines developed to enhance turbine cost-effectiveness and reliability.

-- Began full-scale, multi-year research and development activities (50% industry cost share) to explore new concepts and apply cutting edge technology for next-generation, innovative, utility-grade wind turbines. These research activities will make wind turbines more cost-effective and more attractive as a power generation technology in many regions of the U.S.

- COOPERATIVE RESEARCH AND TESTING ($7,715)

-- Initiated construction and installation of a wind hybrid systems research and test facility at the NWTC in order to secure operational performance data under controlled conditions to validate design models and evaluate control systems.

-- Provided support for the development of domestic and international consensus standards to ensure U.S. manufactured turbines will not be denied access to overseas markets.

-- Provided technical assistance for village power and stand-alone applications to the U.S. wind industry for targeted international markets.

- TECHNOLOGY DEPLOYMENT ($14,506)

-- Completed construction of a wind turbine verification project in Southwest Texas, with the local utility and the Electric Power Research Institute, to allow the operational evaluation of new advanced wind turbines in a typical utility environment.

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Selected 3 projects for contract negotiations that will result in over 50MW of installed capacity in the U.S. (10,500)

FY 1996 Accomplishments (to date and planned):

- APPLIED RESEARCH ($9,900)

III. Performance Summary: WIND ENERGY R&D (Cont'd)

-- Provide industry with enhanced structural dynamics computational modeling capability for the design and analysis of variable speed and teetered rotors with aerodynamic controls. This will provide the first integrated systems analysis approach to advanced flexible structure turbine designs.

-- Complete variable speed turbine performance testing under actual field conditions. This project will provide the test data necessary to select optimal variable speed control strategies for maximizing wind energy capture.

-- Provide enhanced field and laboratory instrumentation for the NWTC in order to more effectively support DOE and industry research activities.

- TURBINE RESEARCH ($15,320)

-- Building on the FY95 effort, complete near-term turbine research and field testing, resulting in three highly competitive U.S. wind turbines that have already secured sales of $300 million in domestic and international markets.

-- Complete field tests for advanced turbine components and subsystems including a variable-speed generation system, direct-drive generator, fatigue-based control system, and a trailing-edge of the blade aerodynamic brake, for use in next-generation wind turbine research efforts.

-- Complete detailed designs and initiate fabrication of turbines under the multi-year, next-generation turbine research activities that focus on enhanced performance, efficiency, and reliability.

- COOPERATIVE RESEARCH AND TESTING ($6,331)

-- Complete installation of a wind hybrid systems research and test facility at the NWTC in order to conduct research and provide the U.S. wind industry with technical data for specialized wind energy applications in off-grid locations.

-- Complete construction of a new world class Industrial User Facility at the NWTC that will provide state-of-the-art research facilities for industry's use on a reimbursable basis.

-- In accordance with Congressional direction, provide engineering design and analysis assistance to support the Kotzebue, Alaska wind project.

- TECHNOLOGY DEPLOYMENT ($0)

III. Performance Summary: WIND ENERGY R&D (Cont'd)

-- With prior year funding, complete construction of a second wind turbine verification project with the Electric Power Research Institute and a Vermont utility. These verification projects evaluate prototype advanced wind turbines in diverse areas and conditions under typical utility operating environments.

-- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: With prior year funding, negotiate contracts for, and initiate construction of, selected wind farm projects that will result in over 50MW of installed capacity. ($0)

FY 1997 Planned Accomplishments:

- APPLIED RESEARCH ($15,200)

-- Complete installation and instrumentation upgrade of the new Advanced Research Turbine test facility located at the NWTC. This innovative test bed will permit complete test and performance testing of advanced prototype turbine components currently under research development.

-- Complete Golden Eagle Population study and related avian modeling which will provide industry with a comprehensive scientific approach to evaluating potential wind turbine and avian interactions.

-- Provide equipment necessary to construct a 1.5 megawatt dynamometer for turbine research testing activities at the NWTC.

- TURBINE RESEARCH ($19,700)

-- Complete fabrication and initiate proof-of-concept testing of prototype systems under the continuing multi-year next-generation turbine research program. Research activities will lead to multiple utility-grade, innovative wind turbines for the marketplace in 2000, that are a major advance over current technology and capable of producing electricity at 2.5 cents per kWh in 15 mph winds.

-- Complete fabrication and initiate field tests of newly manufactured blade prototypes under the Department's Blade Manufacturing Project (20-50% industry cost share). Research efforts will focus on more efficient and cost-effective ways to manufacture wind turbine blades.

- COOPERATIVE RESEARCH AND TESTING ($8,201)

-- Continue to provide the National Wind Technology Center with laboratory data collection equipment and

III. **Performance Summary**: WIND ENERGY R&D (Cont'd)

R&D support for prototype testing.

- TECHNOLOGY DEPLOYMENT ($6,549)

  -- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: - Select utility industry partners for the highly leveraged Turbine Verification Program to evaluate prototype advanced wind turbines in diverse areas of the country under typical utility operating environments. ($2,750)

  -- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: - Select partners for the Distributed Wind Cluster Deployment Program, under which landowners, farmers, and small utilities will cost share small, distributed wind projects as an alternative to large scale wind farms. ($3,799)

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 5,300,000 in Applied Research will result in an increase of core research activities conducted at the National Wind Technology Center and competitively selected Universities and HBCUs, and will provide for a 1.5 megawatt dynamometer for research testing at the National Wind Technology Center.

The increase of $ 4,380,000 in Turbine Research will allow for the completion of three innovative utility-grade wind turbines capable of producing electricity at $2.5 cents per/kWh in 15 mph winds.

The increase of $ 1,870,000 in Cooperative Research and Testing will result in additional technology assistance to U.S. companies competing for global markets, and certification type testing at the National Wind Technology Center.

The increase of $ 6,549,000 in Technology Development will restore CCAP activities in the Turbine Verification Program, and support a refocussed Distributed Wind Cluster Deployment Program from large wind farms to small wind projects.

RENEWABLE ENERGY PRODUCTION INCENTIVE PROGRAM

I. Mission Supporting Goals and Objectives:

A. Program Description

The Renewable Energy Production Incentive (REPI) established by EPAct Section 1212 is a key program for assisting developers in gaining market entry and feedback on the operation and maintenance needs of grid connected renewable energy systems. For qualified renewable energy facilities owned by State entities or non-profit membership owned utilities, REPI provides a payment for energy produced by these facilities, thereby encouraging both their acquisition and dispatch. The utility ownership is an important feature of this program because utilities represent an important target market toward which the renewable research and development activities is directed.

B. Estimates of Benefits

At the proposed funding level, the REPI program is expected to yield the following benefits:

	2000	2005
Annual Primary Energy Displaced	0.007 Q	0.013 Q
Annual Displaced Electricity Value ($0.07/kWh)	$46 M	$88 M
Carbon Equivalent Emissions Reductions	0.14 MMT	0.26 MMT

The values cited in the table represent renewable energy contributions from facilities owned and operated by publicly owned utilities and non-profit cooperatives. In addition to benefits from the energy related contributions, the utility experience with these installations helps to convince these and other utilities to consider similar renewable energy investments.

C. Performance Measures

The goals of the REPI program are to encourage adoption of renewable energy systems and to increase the involvement and experience base of utilities and other users with these systems. Consequently, the principal measures of program effectiveness relate to (a) the total amount of installed capacity induced by the program

I. **Mission Supporting Goals and Objectives**: RENEWABLE ENERGY PRODUCTION INCENTIVE PROGRAM (Cont'd)

and (b) the number of utilities and other organizations that subsequently invest in renewable energy facilities.

1995 Baseline Measure: A total of 118 MW of renewable energy systems were installed by 5 organizations.

1997 Performance Measure: Installed capacity will have increased to 200 MW and 10 organizations will own qualified facilities.

2003 Performance Measure (the final year of eligibility): A total of 25 organizations will own and operate renewable facilities totaling 400 MW.

II. **Funding Schedule**:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
REPI	$ 4,659	$ 662	$ 3,489	$ 2,827	+427
Total, Renewable Energy Production Incentive Program	$ 4,659	$ 662	$ 3,489	$ 2,827	+427

III. **Performance Summary**: RENEWABLE ENERGY PRODUCTION INCENTIVE PROGRAM

FY 1995 Accomplishments:

- Renewable Energy Production Incentive ($4,659)

  A rule was developed and published in the Federal Register to formally establish the REPI program.

- Payments were made for energy produced by qualified renewable energy facilities; all applicants received full payment.

III. Performance Summary: RENEWABLE ENERGY PRODUCTION INCENTIVE PROGRAM (Cont'd)

FY 1996 Accomplishments (to date and planned):

- Renewable Energy Production Incentive ($662)

  Payments are being made for energy produced by qualified renewable energy facilities; all applicants will receive full payment.

- Together with stakeholders, efforts are being initiated to develop an improved REPI-type program that would have increased incentive value.

FY 1997 Planned Accomplishments:

- Renewable Energy Production Incentive ($3,489)

  Payments will be made for energy produced by qualified renewable energy facilities; funding should be sufficient to fully pay all applicants.

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 2,827,000 in REPI is required to accommodate an estimated increase of 3-6 utility applicants. FY 1996 REPI funding totals $2,988,000 and consists of $662,000 (shown in the table in Section II) contributed from FY 1996 solar energy accounts plus $2,326,000 in FY 1995 carryover funds.

RESOURCE ASSESSMENT

I. **Mission Supporting Goals and Objectives**:

Reliable information on renewable energy resources is essential for the successful design, planning, and deployment of renewable technologies. This information is being developed in ways such that it can be displayed geographically and also temporarily to determine how the various technologies will perform at different locations, and how renewable technologies might be integrated into electric utility systems or be deployed as stand-alone systems. U.S. and international data bases for various renewable technologies are being incorporated into a multi-resource data base at the National Renewable Energy Laboratory (NREL). Products from these data bases are being made available through NREL's Renewable Energy Data Center. Geographic Information Systems are being used as a tool to display resource information, with a particular focus currently on solar and wind resources. Planning for incorporating other renewable resource information into the data base and making it available through the Renewable Energy Data Center has also begun. Due to budget constraints, no program funds are being requested in FY 1997.

1147

II. **Funding Schedule**:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Resource Assessment	$ 3,847	$ 1,942	$ 0	$ -1,942	-100
Total, Resource Assessment	$ 3,847	$ 1,942	$ 0	$ -1,942	-100

III. **Performance Summary**: RESOURCE ASSESSMENT

FY 1995 Accomplishments:

- Resource Assessment ($3,847)

  A Cooperative Network for Renewable Resource Measurements solicitation was issued which is expected to add seven solar measurement sites and six wind measurement sites to our exiting resource measurement network.

III. **Performance Summary**: RESOURCE ASSESSMENT (Cont'd)

- Established a center at NREL for data integration and geographic analysis.
- Initiated the development of a comprehensive renewable energy database to include solar, wind and biomass resource data.

FY 1996 Accomplishments (to date and planned):

- Resource Assessment ($1,942)

  Continue development of the Cooperative Solar Measurement Network.

- Continue development of the Comprehensive Renewable Energy Database.
- Increase capabilities of the Renewable Energy Data Center.

FY 1997 Planned Accomplishments:

- Resource Assessment ($0)

  None. Program close out initiated with prior year funds.

Explanation of Funding Changes FY 1996 to FY 1997

The decrease of $ 1,942,000 in Resource Assessment funding effectively terminates the program.

I. Mission Supporting Goals and Objectives:

A. Program Description

The Solar and Renewable Energy Deployment programs strive to increase sales and exports of proven renewable energy technologies. By addressing market barriers; the programs "pull" rather than "push" the technologies into the marketplace, thereby bringing economic growth, jobs, a cleaner environment and a lower price for the technologies in the future.

The Solar and Renewable Energy Deployment programs were established in response to legislative mandates to help ensure rapid and efficient commercialization of renewable energy technologies into domestic and international markets, in order to stimulate near-term economic growth and lay the groundwork for long-term growth. They address specific problems that slow the acceptance of new and existing technologies and speed deployment of technologies by addressing clearly defined target markets or distinct market barriers. The mission of the programs is two-fold: work with industry to accelerate the rate at which viable, new renewable energy technologies are pulled into the marketplace, and increase the extent to which energy market decisions are based on a better understanding of the economics, environmental and energy security benefits of these technologies.

The Solar and Renewable Energy Deployment programs achieve their mission by directly educating consumers; providing technical and financial assistance to emerging renewable energy entrepreneurs to increase private sector investment in market-ready technologies; and supporting the development of fair and competitive international markets for U.S. technologies through the elimination of market barriers.

The Solar and Renewable Energy Deployment Programs have three main thrusts. First, the Solar International Program increases U.S. exports of renewable (RE) technologies worldwide through the development of strategic markets, public/private partnerships and by increasing commercial financing resources for major foreign purchases of U.S. renewable energy products. Second, the Commercialization Ventures (CV) program facilitates the entrance of viable, new renewable energy technologies into the marketplace by reducing financial barriers to their commercialization and by leveraging private sector funding. Finally, the Information and Communications Transfer program supports a coordinated program which provides information and technical assistance to individuals, businesses, State and local governments. While work will continue on existing projects in the Tribal Grants program, no new efforts are anticipated.

I. **Mission Supporting Goals and Objectives**: SOLAR AND RENEWABLE ENERGY DEPLOYMENT (Cont'd)

B. Estimates of Benefits

At the current funding levels, the Commercialization Ventures portion of the Solar and Renewable Energy Deployment programs is expected to yield the following benefits in the U.S.:

	1997	2000	2010	2020
Total Primary Energy Displaced (million MMBtu)	3.7	8.5	30.4	62.2
Carbon Equivalent Emissions Reductions ('000tons)	7.9	13.6	33.2	59.2

The international program will yield similar benefits in the countries purchasing the technologies, while increasing U.S. exports and jobs. Using FY 2000 funding, the Solar International programs will generate $82 million in cumulative exports and $20 million in Federal tax revenues.

C. Performance Measures (highlights)

The following performance measures will be used by the Solar and Renewable Energy Deployment programs to monitor their progress toward meeting its commitments and goals:

1996 Performance Measures

-- Expand international strategy into the Asia/Pacific region and approve 3-5 projects for inclusion in the Initiative on Joint Implementation program.

-- Select an additional 3-4 commercialization ventures projects to receive financial assistance, and provide non-financial business assistance to another 5-10 projects to help secure private venture capital leverage from these projects private investment of at least $15 million.

-- Respond to an estimated 70,000 inquiries through the Energy Efficiency and Renewable Energy Clearinghouse (EREC).

-- Increase the quality and availability of the information available through Energy Efficiency and Renewable Energy Network (EREN) on the World Wide Web, by adding 125 resource links, adding 360 members to the Users Group and implementing a customer survey.

I. **Mission Supporting Goals and Objectives**: SOLAR AND RENEWABLE ENERGY DEPLOYMENT (Cont'd)

-- Mail Technical Information Program (TIP) products to approximately 150,000 customers.

1997 Performance Measures

-- Complete projects in Chile and implement international strategy in another Latin American country.

-- Provide non-monetory business assistance to 5-10 firms through the Commercialization Ventures financial advisor.

-- Respond to 60,000 inquiries through EREC.

-- Achieve a 10 percent increase in development and usage of EREN.

-- Mail TIP products to approximately 150,000 customers.

1998-1999 Performance Measures

-- Increase activities in Asian and Pacific markets and continue to build on preliminary work in Africa.

-- Provide non-financial business assistance to 5-10 firms.

2000 Performance Measures

-- Generate significant exports of renewable energy technologies and Federal tax revenues through information dissemination, technical assistance, participation in international organizations and activities aimed at identifying opportunities for renewable energy technologies in other countries.

-- By the year 2000, 8-10 new renewable energy commercial ventures will have entered the marketplace because of assistance from the Commercialization Ventures program, leveraging at least $1 of private funds for every Federal dollar invested.

II. **Funding Schedule**: SOLAR AND RENEWABLE ENERGY DEPLOYMENT

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Solar International	$ 8,953	$ 3,886	$ 6,149	$ 2,263	+ 58
Commercialization Ventures	11,161	2,840	1,000	-1,840	- 65
Information and Communications	2,153	1,345	1,360	15	+ 1
Tribal Grants	6,600	6,600	0	-6,600	-100
Total, Solar and Renewable Energy Deployment	$ 28,869	$ 14,671	$ 8,509	$ -6,162	- 42

III. **Performance Summary**: SOLAR AND RENEWABLE ENERGY DEPLOYMENT

FY 1995 Accomplishments:

- Solar International ($8,953)

  Promoted renewable energy exports in high priority markets by working with the renewable energy industries and other Federal agencies to develop and implement international strategies that assist industry. Specifically, the markets in Chile, Brazil and Argentina have been accessed through rural electrification; demonstration projects in schools, clinics and other public facilities; and progress under memorandum of understanding.

- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: The U.S Initiative on Joint Implementation (USIJI) assisted private industry, primarily through provision of technical and project assistance, in instituting greenhouse gas emission mitigation projects in other countries to increase exports of U.S. technologies. Identified 7 projects in the Round I that represent $40 million in private investment; held 5 workshops (Costa Rica, Chile and Thailand, plus two domestically). ($3,000)

- Implemented the Committee on Renewable Energy Commerce and Trade (CORECT) export strategy in Latin America and the Caribbean, established multiple cost-shared joint ventures, and opened access to Brazil, Argentina and Chile for near-term exports.

- CORECT has identified 175 project opportunities for the renewables industry, valued at approximately $1.5 billion to date, and helped 16 projects secure outside funding totalling $200 million. In FY 1996, it is hoped that 30 more projects will find financing of $385 million.

- Finalized program plans and initiated training program with U.S. AID for developing country energy

1152

III. **Performance Summary**: SOLAR AND RENEWABLE ENERGY DEPLOYMENT (Cont'd)

. decision-makers.

- Commercialization Ventures ($11,163)

  The Commercialization Ventures Program finalized the selection of a financial advisor to provide business and technical assistance. The program also selected 5 projects for financial assistance that will leverage over $10 million in private investment.

- Information and Communications ($2,153)

  Energy Efficiency and Renewable Energy Clearinghouse (EREC) responded to 60,000 requests for information. Of those requests, 768 users (approximately 64 per month) received tailored technical and business assistance. Of the EREC users commenting on the Clearinghouse, more than 97 percent have rated the quality of the information and services provided as either "good" or "excellent."

- EREC overhauled and improved the bulletin board system to make it more user friendly. As a result, usage statistics jumped from 200 users in April to approximately 2,000 in June.

- The Technical Information Program (TIP) produced the following products for the Cities and Counties Campaign: 23 fact sheets, resource guide, folder, flyer/order form, updated order form, evaluation card, press kit, article for "Nation Cities Weekly" insert, specialized flyer to economic development contacts, home page and electronic files on NREL World Wide Web server.

- The Education program's Junior Solar Sprint activity distributed 25,000 kits which involved approximately 100,000 students in the 7th and 8th grade in 46 states. Fifty-three host sites ran competitions.

- Tribal Grants ($6,600)

  In FY 1994 and 1995, 35 grants totalling $11.4 million were awarded to 29 tribes and Alaskan native corporations in 13 states. Provided DOE support for ongoing Navajo transmission project administered through Western Area Power Administration. ($6,600)

FY 1996 Accomplishments (to date and planned):

- Solar International ($3,886)

  Through CORECT, develop expanded international strategy to include the Asia/Pacific region, consisting of

III. Performance Summary: SOLAR AND RENEWABLE ENERGY DEPLOYMENT (Cont'd)

activities such as trade missions, trade events and project identification.

- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: Significantly increase project development in partnership with non-governmental organizations active in joint implementation activities to increase exports of U.S. technologies and generate international cooperation on climate change; USIJI Evaluation Panel will conduct workshops, refine project monitoring methodologies, and identify 15-20 Round II projects in cooperation with other federal agencies. ($1,900)

- Monitor existing activities in Chile, Argentina and Brazil; finalize implementation of previously planned activities and curtail future commitments due to decreased funding.

- Commercialization Ventures ($2,840)

  Through the financial advisor, the Commercialization Ventures Program will provide financial assistance to 3-5 new energy businesses and 5-10 energy entrepreneurs with non-financial business assistance.

- Begin Management Plan for Renewable Energy and Energy Efficiency Technologies pursuant to Section 1202 of EPACT; plan will assess program needs, objectives and priorities; establish milestones and identify program areas where funding has changed since previous plan (1994).

- Information and Communications ($1,345)

  EREC will have an electronic mailbox on the Energy Efficiency and Renewable Energy Network (EREN) which will allow customers to directly ask questions about EERE technologies and receive prompt responses (within 48 hours). EREN users will be able to access the EREC bulletin board system via an Internet telnet session.

- EREC expects to maintain level of quality and increase requests through further outreach efforts. Complete an average of one new fact sheet per month.

- The TIP program will complete the final four Cities and Counties fact sheets and develop and implement a comprehensive outreach plan.

- TIP will complete a small business brochure that will target small businesses.

- Tribal Grants ($6,600)

III. Performance Summary: SOLAR AND RENEWABLE ENERGY DEPLOYMENT (Cont'd)

Continue ongoing Navajo transmission project administered by the Western Area Power Administration ($6,100). Provide DOE support for Crow cogeneration plant ($500).

The Tribal Government Assistance will continue to monitor the FY94 and FY95 grants and conduct orderly shutdown of the program using prior year funds (with the exception of the Navajo and Crow projects).

FY 1997 Planned Accomplishments:

- Solar International ($6,149)

  CORECT will continue to provide export and technical assistance to U.S. renewable energy industries in high priority markets, such as Latin and South America, Africa, and Eastern Europe in the new independent countries.

- CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION: USIJI will continue a number of cost-effective projects implemented jointly between U.S. industry and partners in developing countries and countries with economies in transition and will also provide technical assistance to U.S. firms and their partners to increase the quality of projects to ensure a successful completion of the international pilot phase of the program. ($2,000)

- America's 21st Century program will increase the number of cost-shared joint ventures with the public and private sector in Latin America.

- Commercialization Ventures ($1,000)

  Through a financial advisor, the Commercialization Ventures Program will provide non-financial business and technical assistance only. No projects will be directly cost-shared.

- Information and Communications ($1,360)

  Continue EREC programs and maintain quality, although 100% fewer requests will be answered.

- The TIP program will continue focused support and targeted distribution of communications products promoting EE/RE technologies.

- TIP will reach over 150,000 constituents of its target audience with TIP communication products.

- Tribal Grants ($0)

III. Performance Summary: SOLAR AND RENEWABLE ENERGY DEPLOYMENT (Cont'd)

No Activities.

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 2,263,000 in Solar International will provide funds for Americas' 21st Century program to continue programs in Chile and Argentina and expand into other Latin American countries; USIJI will be able to develop more cost-shared projects.

The decrease of $ 1,840,000 in Commercialization Ventures will eliminate all direct Federal financial assistance to projects.

The increase of $ 15,000 in Information and Communications will reduce the number of requests which the Energy Efficiency and Renewable Clearinghouse can respond to by 10 percent and will reduce the number of fact sheets developed and distributed by the technical Information Program promoting EERE technologies.

The decrease of $ 6,600,000 in Tribal Grants discontinues the program.

GEOTHERMAL ENERGY R&D

I. Mission Supporting Goals and Objectives:

A. Program Description

The mission of the Geothermal Energy Program is to sponsor research and development in advanced geothermal energy technology, and work in partnership with U.S. industry and electric utilities to provide a competitive energy option for meeting U.S. and worldwide energy needs.

The goal of the Geothermal Energy Program is to achieve, by 2005, a life-cycle cost of producing electricity of 3 cents per KWh (the current cost ranges between 5 to 8 cents per kilowatt-hour). This is expected to result in about 15,000 MW of new capacity installed by U.S. firms during the ensuing decade. The program will accomplish this by collaborating with industry in developing cost-competitive geothermal technologies to: 1) locate and confirm undiscovered geothermal reservoirs, 2) reduce exploration and production drilling costs in hard rock environments, and 3) enhance conversion efficiency of geothermal energy into electric power. The program will also accelerate adoption of geothermal heat pumps (GHP) to reduce electricity demand and greenhouse gas emissions. In addition, research and analysis relating to restructuring in the electric utility industry will be conducted on issues associated with integration of Geothermal systems into an increasingly competitive industry framework. Additional fundamental research on resource characteristics will identify cost-competitive options for systems integration.

These program actions will yield increases in the amount of geothermal energy that can be economically recovered and will assist the U.S. geothermal industry in retaining U.S. market share while capturing up to 50 percent of new geothermal international power markets over the next decade valued in excess of $20 billion.

Geothermal energy in its various forms comprises 40% of the U.S. energy resource base. Electric power from geothermal resources is delivered at low environmental impact and has the highest reliability of base-load power from any source. Geothermal power in the U.S. has grown from 800 megawatts in 1980 to over 2700 installed megawatts today, the largest single fraction of the world's current total of 5800 geothermal megawatts. Technological improvements sponsored by the Department have spurred this advance and have helped U.S. geothermal companies to achieve over $6.0 billion in international resource development agreements signed in the last two years.

The Geothermal Energy Program works closely with the U.S. geothermal industry in developing cost-competitive

I. Mission Supporting Goals and Objectives: GEOTHERMAL ENERGY R&D (Cont'd)

technologies to increase the economic availability of domestic geothermal resources and help provide the U.S. industry with a significant technological advantage in highly competitive overseas markets. Over 50% of the Geothermal Energy Program is cost-shared on a 50/50 basis with industry and other participants. Moreover, Federal and state governments currently receive in excess of $20.0 million each year in geothermal lease and royalty payments.

B. Estimates of Benefits

At the proposed funding levels the Geothermal Energy R&D Program is expected to yield the following quantifiable benefits:

	2000	2010	2020
Annual Primary Energy Displaced	0.04 Q	0.58 Q	1.59 Q
Annual Displaced Electricity Value ($0.08/kWh)	$350 M	$4,130 M	$11,235 M
Carbon Equivalent Emissions Reduction	1.15 MMT	13.71 MMT	38.96 MMT

C. Performance Measures

The following performance measures will be used by the Geothermal R&D Program to track its commitment to reduce the life-cycle cost of producing electricity and increasing the rate of adoption of geothermal heat pumps (GHP).

1996 Performance Measures (highlights)

-- Confirm 1 new resource development area.

-- Establish 2 co-funded sponsors under NADET.

-- Start 3 cost-shared field tests of new energy conversion projects at commercial power plants.

-- Transfer 2 new conventional drilling technology improvements to industry.

-- Achieve installation of 75,000 new GHP units, up from 40,000 in 1994.

I. **Mission Supporting Goals and Objectives**: GEOTHERMAL ENERGY R&D (Cont'd)

-- Co-sponsor 6 utility cost-shared GHP demonstration projects.

1997 Performance Measures

-- Cost-share drilling of 2 or more exploration wells.

-- Transfer 1 new conventional drilling technology improvement to industry.

-- Demonstrate improvement for conventional drilling tools.

-- Cost-share 2 or more additional improved energy conversion projects.

-- Encourage installation of 120,000 new GHP units.

-- Co-sponsor 10 utility cost-shared GHP demonstration projects.

1998-99 Performance Measures

-- Cost-share confirmation of 2 new resource development areas.

-- Reduce conventional drilling and completion costs by 10%.

-- Reduce geothermal power plant operating and maintenance cost by 10%.

-- Move NADET technologies into bench-scale and field-test R&D modes.

-- Complete development of several new advanced high-temperature drill bit systems.

-- Encourage installation of 525,000 new GHP units.

-- Co-sponsor 24 utility cost-shared GHP demonstration projects.

2000 Performance Measures

-- Cost-share confirmation of 1 new resource development area.

I. **Mission Supporting Goals and Objectives**: GEOTHERMAL ENERGY R&D (Cont'd)

-- Complete 2 demonstrations of economic benefits of improved electric generating systems.

-- Encourage installation of 425,000 new GHP units.

-- Co-sponsor 12 utility cost-shared GHP demonstration projects.

II. **Funding Schedule**:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Geothermal Electric R&D and Development	$ 43,837	$ 28,092	$ 29,118	$ 1,026	+ 4
Geothermal Heat Pump Deployment	1,600	5,300	6,482	1,182	+ 22
Total, Geothermal Energy R&D	$ 45,437	$ 33,392	$ 35,600	$ 2,208	+ 7

III. **Performance Summary**: GEOTHERMAL ENERGY R&D

FY 1995 Accomplishments:

- GEOTHERMAL ELECTRIC POWER R&D ($43,837)

  Exploration

  -- Drilled two exploration wells, in conjunction with industry, to characterize new reservoirs and to discover and characterize new geothermal fields.

  -- Cost-shared with industry the successful application of new integrated exploration strategies, i.e., remote sensing and biogeochemistry techniques.

  -- Completed first of two slimhole wells, jointly funded with industry, to verify cutting exploration costs by 50% and predicting reservoir performance from a slimhole.

- Drilling

1160

III. **Performance Summary**: GEOTHERMAL ENERGY R&D (Cont'd)

-- Began a national R&D program on advanced drilling and excavation technologies, cost-shared with industry and other Federal agencies, to produce a revolutionary system for rock penetration at much lower cost than possible with current technology.

-- Constructed a new facility for full-scale lost circulation control testing and initiated pumping tests of new lost circulation sealing materials with industry to evaluate performance.

-- Designed and tested improved synthetic diamond bits in cost-shared programs with industry and DOE's Office of Fossil Energy, to reduce cost of drilling.

- Reservoir Technology

-- Cost-shared with industry and various government entities the design of a strategy to inject fluids from municipal wastewater plants into The Geysers steam field to restore and maintain power production levels while addressing waste water disposal issues.

-- Evaluated selected international markets to provide information to the U.S. geothermal industry that will assist in penetrating overseas energy markets.

-- Canceled the hot dry rock demonstration plant solicitation and initiated plans for site restoration and/or transfer efforts at Fenton Hill, N.M. Initiated plans to integrate hot dry rock R&D activities into mainstream geothermal R&D programs.

- Energy Conversion

-- Analyzed cost-shared field test data on a prototype Biphase rotary separator turbine.

-- Developed and tested new materials (such as coatings for heat exchangers) and processes (such as super-saturated turbine expansions and waste handling technology) to reduce costs associated with geothermal operations.

- Environment

-- Initiated plans with industry to cost-share construction of The Geysers pipeline project.

-- Awarded a cooperative agreement for the cost-shared construction of a 5 MW "ice-breaker" power plant in Lee Hot Spring, NV.

III. Performance Summary: GEOTHERMAL ENERGY R&D (Cont'd)

-- Conducted three environmental site reviews and restored one site.

- Hydropower

-- Selected two advanced hydropower turbine proposals for contract negotiations for the development of conceptual designs.

- GEOTHERMAL HEAT PUMP PROGRAM ($1,600)

-- Working with utility partners, conducted initial benchmarking studies of geothermal heat pump installation and technology, utility marketing practices, existing financing options, and consumer preferences.

-- Established the Geothermal Heat Pump (GHP) Consortium with over 100 utility members representing the majority of electricity consumers in the Nation.

FY 1996 Accomplishments (to date and planned):

- GEOTHERMAL ELECTRIC POWER R&D ($28,092)

Exploration

-- Introduce advanced technologies (i.e., integrated exploration techniques) for finding hidden geothermal resources at lower exploration costs and reduced risk.

-- Confirm 1 to 2 new geothermal fields under the industry-coupled drilling program.

- Drilling

-- Under the national R&D program on advanced drilling and excavation technologies, establish cofunded partnerships with other stakeholders to develop revolutionary drilling technologies for rock penetration.

-- Field-test the "drillable straddle packer" technology to plug lost circulation zones in wells and transfer to industry.

III. **Performance Summary**: GEOTHERMAL ENERGY R&D (Cont'd)

-- Complete the prototype design of a new downhole instrument system capable of supporting scientific measurements in geothermal and deep gas wells at temperatures between the present limit of 180 degrees Celsius and 300 degrees Celsius.

-- Train industry personnel in use of tools for measuring pressure/temperature in adverse downhole environments and transfer technology to industry.

-- Complete development of new rolling float and doppler flowmeters and transfer to industry.

- Reservoir Technology

-- Conduct several cost-shared cooperative field tests with industry to correct pressure declines at The Geysers steam field.

-- Develop plans, in cooperation with industry, for a restructured hot dry rock program to address the remaining technological and economic uncertainties associated with commercializing this very large geothermal resource.

-- Develop and test improved technologies to measure characteristics of subsurface hydrothermal systems and dependably produce geothermal fluids from the reservoirs.

- Energy Conversion

-- Evaluate technologies to improve the efficiency and effectiveness of energy conversion processes, including direct use, materials, process chemistry, waste handling, and heat transfer processes.

-- Retrofit direct contact condenser improvements.

-- Construct full-scale Biphase turbine-electric system.

-- Begin construction of prototype waste treatment project at The Geysers.

- Environment

-- Conduct environmental monitoring and compliance review of selected geothermal projects and restore one site.

III. Performance Summary: GEOTHERMAL ENERGY R&D (Cont'd)

-- Continue Lake County cost-shared pipeline project with industry at The Geysers.

-- Begin feasibility study for piping treated effluents from Santa Rosa to The Geysers streamfield.

-- Complete final report on Geopressured-Geothermal Program.

- Hydropower

-- Complete conceptual design phase of the advanced hydropower turbines; initiate request for proposals for detailed engineering design and model testing phase.

- GEOTHERMAL HEAT PUMP PROGRAM ($5,300)

Implement two regional utility cost-shared model GHP programs: acquire and begin analysis of statistically-valid electric load and system performance data; coordinate with the DOE Building's market pull collaboratives.

FY 1997 Planned Accomplishments:

- GEOTHERMAL ELECTRIC POWER R&D ($29,118)

Exploration
Analyze data from cooperative field tests with industry; conduct field case studies using new integrated exploration tools; cost-share the drilling of several exploratory wells.

- Drilling

-- Under the national R&D program on advanced drilling and excavation technologies, begin cost-share joint ventures to develop and test revolutionary drilling technologies for rock penetration.

-- Complete bit work in developing new synthetic diamond drill bits.

-- Complete the prototype design of a new downhole power system capable of providing power to supporting scientific measurements at temperatures between the present limit of 180 degrees Celsius and 300 degrees Celsius.

-- Complete commercialization of the downhole mud-hammer-driver drilling system.

III. Performance Summary: GEOTHERMAL ENERGY R&D (Cont'd)

-- Field test new expert system and foam system under the lost circulation control activities.

- Reservoir Technology

  -- Conduct reservoir studies in new areas needed by U.S. industry to effectively compete in all markets, leading to the capture of 50% of the world geothermal market.

  -- Initiate program activities to address the remaining technological uncertainties in the new industry-led dry hot rock (HDR) program.

  -- Complete Fenton Hill HDR site restoration and/or transfer of programmatic responsibility to another user organization.

- Energy Conversion

  -- Completed development of 5MW powerplant at Lee Hot Spring, Nevada.

  -- Complete design of advanced energy conversion demonstration plant.

  -- Cost-share test of thermally conductive coatings.

  -- Complete prototype waste treatment project at The Geysers and begin full-scale operations.

- Environment

  -- Implement the Lake Country project to inject treated wastewater effluent into The Geysers steamfield leading to the displacement of 330,000 tons of carbon dioxide emissions annually.

  -- Complete feasibility study for piping treated effluents from Santa Rosa to The Geysers steamfield.

- Hydropower

  -- Select advanced hydropower turbine proposals for detailed engineering design and for model fabrication and testing.

- GEOTHERMAL HEAT PUMP PROGRAM ($6,482)

III. Performance Summary: GEOTHERMAL ENERGY R&D (Cont'd)

-- Implement three regional utility cost-shared GHP programs: continue collection and analysis of statistically-valid electric load and maintenance data, verify annual GHP sales of 120,000 units in 1997; coordinate with the DOE Building's and EPA's programs to improve GHP financing and building envelopes.

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 1,026,000 in Geothermal Electric R&D and Development allows completion of funding for The Geysers Pipeline project, and a slight increase in drilling R&D identified by industry as a high priority.

The increase of $ 1,182,000 in Geothermal Heat Pump Deployment restores funds lost in previous years and puts this activity on schedule for completion of 2000 goals.

HYDROGEN RESEARCH AND DEVELOPMENT

I. Mission Supporting Goals and Objectives:

A. Program Description

The mission of the Hydrogen Research and Development program is to encourage and support the development of cost competitive hydrogen technologies and systems that will reduce the environmental impacts of energy use and enable renewable energy resource penetration into the U.S. energy mix. Hydrogen produced using renewable energy power systems or generated by gasification of biomass can be stored and transported to U.S. energy end-use markets (utility, transportation, industrial) and converted directly to electricity in a fuel cell or into thermal energy via combustion. To achieve its mission, the hydrogen program will: 1) conduct a core research and development effort in critical mid- to long-term production, storage and transport technologies for application in renewable energy systems; 2) cost-share with industry on hydrogen production by photochemical, gasification and reforming processes for near-term market introduction; 3) undertake industry and public outreach and education to improve technology transfer for application of research results for: increasing domestic energy supply options; reducing reliance and expenditures on imported oil; and reducing greenhouse gases and air pollutant emissions by displacement of fossil fuels.

B. Estimates of Benefits

The estimated benefits are based on a contribution of hydrogen fuel cells to the nation's future electricity generation mix. Hydrogen fuel cells are expected to account for 36 GW, a 4.2% share of the projected U.S. total by the year 2020. Between 2016-2020, models project installation of an additional 21 GW of fuel cells, 27% of all new electric capacity.

	2000	2010	2020
Annual Primary Energy Displaced	0.00 Q	0.01 Q	1.16 Q
Annual Displaced Electricity Value ($0.07/kWh)	$7 M	$73 M	$8,123 M
Carbon Equivalent Emissions Reductions	0.02 MMT	0.15 MMT	17.06 MMT

C. Goals

-- 2005 - Hydrogen use increases from 0.3Q/yr (as a chemical feedstock to produce reformulated gasoline) to

I. Mission Supporting Goals and Objectives: HYDROGEN RESEARCH AND DEVELOPMENT (Cont'd)

0.6Q/yr (as a transportation fuel and chemical feedstock) the equivalent of 54 million barrels of oil.

-- 2010 - Deployment of new production technologies reduces emissions by: 61,000 tons per year NOx, 1,000,000 tons per year CO, and 46 million tons per year CO2.

-- 2010 - Biomass and municipal solid waste gasification contribute the equivalent of 0.2Q/yr production capacity of hydrogen.

-- 2025 - Renewable energy source hydrogen production contribute the equivalent of 10Q/yr in the primary energy market.

Performance Measures (highlights)

-- Develop the engineering data for the design of a process development unit to demonstrate sorbent enhanced steam methane reforming for hydrogen production. (1996)

-- Scale-up from 1 kW to 10kW solar reactor for production of hydrogen bromide. Integrate with an electrochemical cell to electrolyze hydrogen bromide into hydrogen gas. (1996)

-- Develop a laboratory-scale bioreactor to test the feasibility of producing hydrogen from oxygen tolerant algal mutants on a continuous basis. (1996)

-- Optimize silicon-hydrogen multi-junction structures, reduce anodic and cathodic overpotentials of thin-film catalysts with demonstrated stability in alkaline electrolytes and demonstrate stable high efficiency (10%) photoelectrodes for water splitting. (1996)

-- Develop an experimental engineering evaluation platform for a lightweight hydride storage bed and delivery system. Address hydride material and bed fabrication, temperature component design and fabrication, hydrogen sensor technologies, and hydrogen safety issues. (1996)

-- Design a process development unit to demonstrate sorbent enhanced steam methane reforming scaled to 0.1 MM SCFD of hydrogen. (1997)

-- Connect 10 kW solar reactors, for production of hydrogen bromide, in parallel to feed one 100 kW electrolyzer/fuel cell to be demonstrated in an integrated hydrogen production/storage/utilization system. (1998)

II. **Funding Schedule**: HYDROGEN RESEARCH AND DEVELOPMENT

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Hydrogen Research and Development	$ 8,940	$ 14,500	$ 11,012	$ -3,488	- 24
Total, Hydrogen Research and Development	$ 8,940	$ 14,500	$ 11,012	$ -3,488	- 24

III. **Performance Summary**: HYDROGEN RESEARCH AND DEVELOPMENT

FY 1995 Accomplishments:

- Hydrogen Research and Development ($8,940)

  Achieved a yield in excess of 40% for a solar-driven conversion of bromine vapor with water to hydrogen bromide, demonstrating an economically feasible process for hydrogen production using a solar reactor.

- Produced less than 5 ppm NOx under motor conditions using gas blends containing greater than 30% hydrogen with natural gas to meet ultra-low emission vehicle criteria.

- Demonstrated significant direct hydrogen production using algae and sunlight with greater than 3% of the solar energy stored as hydrogen fuel.

- Initiated a photobiological hydrogen production collaborative project between the U.S. (University of Hawaii) and Japan.

- Determined experimentally that twelve times as much hydrogen could be stored on fabricated microcylinders of carbon (nanotube material) compared to commercially activated carbon under the same conditions.

FY 1996 Accomplishments (to date and planned):

- Hydrogen Research and Development ($14,500)

  Initiate optimization of properties of new membranes for use in high temperature electrolysis (150 C range) with solid polymer electrolyte cells for hydrogen production.

- Complete design of municipal solid waste (MSW) separator modules to be used in an MSW gasifier for the production of hydrogen from wastes and biomass.

III. **Performance Summary**: HYDROGEN RESEARCH AND DEVELOPMENT (Cont'd)

- Complete testing of new catalysts to optimize steam reforming of gasified biomass to hydrogen.
- Complete synthesis, characterization and testing of new lightweight metal hydride alloys for high density hydrogen storage.
- Complete testing of advanced semiconductors for optimizing photoelectrochemical production of hydrogen.
- Complete synthesis improvements of carbon nanotubes for hydrogen storage and characterization of properties.

FY 1997 Planned Accomplishments:

- Hydrogen Research and Development ($11,012)

  Complete proof of concept of a hydrogen storage and delivery system using metal hydrides installed on-board a utility vehicle.

- FY 1998 Planned Accomplishments:

  -- Complete prototype scale-up of a 10 kW photochemical hydrogen production system to 100 kW.

  -- Complete installation of 0.1 MM SCFD process development unit for process optimization and scale-up of low temperature reforming of natural gas.

  -- Complete installation of a direct hydrogen-fueled 200 kW phosphoric acid fuel cell for stationary power generation.

Explanation of Funding Changes FY 1996 to FY 1997

The decrease of $ 3,488,000 in Hydrogen Research and Development will eliminate cost-shared industrial R&D directed toward near-term production and end-use technologies including advanced reforming and photochemical production, while maintaining core R&D efforts in hydrogen production and storage.

I. **Mission Supporting Goals and Objectives**:

ELECTRIC ENERGY SYSTEMS AND STORAGE:

The primary mission of the Electric Energy Systems and Storage program is to develop, in collaboration with industry, the advanced supporting power delivery technologies that will increase the flexibility, capacity and efficiency of the Nation's electric power systems and will also enable increased utilization of renewable energy power systems. The Transmission and Distribution R&D program, the High Temperature Superconductivity program, and the Energy Storage R&D program all contribute to this primary mission. A complementary mission of this program cluster is to address potential electric-related institutional and environmental issues which affect the implementation of efficient and cost-effective power delivery. The Electric and Magnetic Fields (EMF) R&D and Climate Challenge programs contribute to this second mission.

A. HIGH TEMPERATURE SUPERCONDUCTIVITY: DESCRIPTION, BENEFITS, AND PERFORMANCE MEASURES

The Department leads the national effort to capture the energy saving potential of superconductivity - the ability of certain materials to carry electricity without resistance losses. The program has mobilized the resources of U.S. industry, national labs and universities to accomplish the two major program goals: solving the difficult problem of manufacturing electrical wires from the family of brittle ceramic materials discovered in 1986 while, in parallel, assisting in the design and development of superefficient motors, transmission cables, generators, transformers, storage devices andcurrent limiters that use these wires.

Superconductivity technology has the promise of increasing electric utility capacity and flexibility, and increasing motor and generator efficiencies above 98 and 99 percent, respectively. The underlying knowledge base needed by researchers to understand and use superconductors is created in the Materials Research component of the program. Superconductivity device technology is created in the Devices and Systems Research component of the program which supports initial efforts on promising concepts that will lead to future utility sector applications. This includes the very successful Superconductivity Partnership Initiative (SPI) which was singled out for praise in the FY 1996 report of the House Energy and Water Development Subcommittee on Appropriations. The SPI is a focused team effort by DOE and industry to drastically reduce the development time (from 10 years to 5 years) for initial commercial introduction of advanced, energy-saving superconducting products. In addition, research and analysis relating to restructuring in the electric utility industry will be conducted on issues associated with integration of High Temperature Superconductivity (HTS) systems into an

I. Mission Supporting Goals and Objectives: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

increasingly competitive industry framework.

At the proposed funding level, the Superconductivity program is expected to yield the following quantifiable benefits:

Superconductivity:	2000	2010	2020
Annual Primary Energy Displaced	0.00 Q	0.03 Q	0.15 Q
Annual Displaced Electricity Value ($0.07/kWh)	$0 M	$239 M	$1,025 M
Carbon Equivalent Emissions Reductions	0.00 MMT	0.62 MMT	2.82 MMT

The principal goal of the superconductivity program is to achieve significant technology advancements that will enable U.S. industry to proceed to commercial development of electric power applications of high temperature superconductivity.

1996-2000 Performance Measures

-- Develop electrical wire with performance of 1,000,000 ampere-meters.

-- Develop electrical wire with cost of $0.01 per ampere-meter.

-- Complete utility qualification testing of 30 meter 115 kV electric transmission cable.

-- Complete qualification testing of 1000 horsepower motor.

-- Sales made of electric utility fault current limiter.

B. ENERGY STORAGE: DESCRIPTION, BENEFITS, AND PERFORMANCE MEASURES

In response to utility needs and increasing opportunities for use of renewable generating technologies, the Energy Storage R&D program is working to develop cost effective storage systems based upon current and future battery technologies, flywheels and superconducting magnetic energy storage. The storage systems will be deployed to enhance utility performance, reliability, reduce costs, and enable use of renewables in high value applications.

I. **Mission Supporting Goals and Objectives**: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

At the proposed funding level, the Energy Storage R&D program is expected to yield the following benefits:

Energy Storage R&D:

Year	2000	2010	2020
Annual Primary Energy Displaced	0.00 Q	0.02 Q	0.03 Q
Annual Displaced Electricity Value ($0.07/kWh)	$11 M	$112 M	$189 M
Carbon Equivalent Reductions	0.00 MMT	0.43 MMT	0.65 MMT

Additional benefits of Energy Storage R&D goal will be to further increase the potential for renewables penetration by 20% by 2010 through the integrated use of storage; this would enhance all reported renewables generation by an additional 20%. In addition to the benefits of energy saved, energy storage also will increase the value of utility power through increased power quality. The deregulation of utilities is bringing about a period of change and uncertainty; deferral of retrofits and upgrades through the increased use of storage may be a preferred strategy until the business climate has stabilized.

The primary goal of the Energy Storage program is to provide advanced technology to increase reliability and performance and therefore competitiveness (including reducing the environmental impact) of generation, transmission, and distribution in the U.S. electric grid system. Success will help increase U.S. industry competitiveness by improving power quality and reliability.

1996-1997 Performance Measures

-- 1996 Continue testing and evaluation of current generation storage components and development of Transportable Battery Energy Storage System (TBESS).

-- 1996 Complete PQ 2000 power quality device (2MW/10 sec) and field test at Pacific Gas and Electric.

-- 1997 Initiate an integrated renewable/generation/storage (RGS) system with 70% cost share by manufacturers and utilities which will result by FY99 in prototype turnkey modular systems. The potential of storage systems coupled with renewable generators is estimated to increase potential market penetration levels for renewables by 20% by 2010.

-- 1997 Develop an Advanced Battery Storage System (ABS) with 50% cost share by host utility and manufacturers which uses a cost-effective and flexible modular approach.

I. Mission Supporting Goals and Objectives: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

-- 1997 Evaluate next generation energy storage technologies for performance and cost-effectiveness in utility use.

1998-1999 Performance Measures

-- Initiate development of a substation power quality device based on advanced power electronics and storage technologies in concert with Public Service Co. of New Mexico and other industrial and utility partners.

-- Incorporate next generation energy storage technologies into renewable and other utility packages.

-- Test and evaluate completed Renewable Generation Storage System.

-- Complete development and testing of Transportable Battery Energy Storage System and Advanced Battery Storage Systems.

1174

C. TRANSMISSION AND DISTRIBUTION: DESCRIPTION

Power converter and power conditioning equipment components represent major cost items for the integration of renewable energy generation technologies into the power delivery system, and in the cost of transmission technologies to deliver power from remote renewable energy generation sites. The development, in collaboration with industry, of advanced voltage-source converter configurations which use fewer components, and the fabrication of advanced power electronic switching materials, such as silicon carbide, in these new configurations can reduce these costs by approximately one half. These and related analytical studies on system integration and real-time system control for renewable energy generation and storage units and superconducting power sector equipment are directly focused on meeting the mission requirements of the Electric Energy Systems and Storage program. Unfortunately, the T&D portion of this activity is being terminated in FY 1996 with no appropriation due to budget constraints and higher program priorities.

D. ELECTRIC AND MAGNETIC FIELDS DESCRIPTION, BENEFITS, AND PERFORMANCE MEASURES:

The Electric and Magnetic Fields R&D program manages a portfolio of coordinated health effects research and exposure measurements that will enable the National Institute of Environmental Health Sciences to assess the risk to human health from exposures to electric and magnetic fields that are associated with the generation,

I. **Mission Supporting Goals and Objectives**: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

delivery and use of electricity. It also supports communication efforts to keep the public and other decision makers informed about this issue. This portfolio consists of two coordinated and interdependent subprograms: the EMF Biological Mechanisms Research program for which $4 million is being requested and the five-year EMF Research and Public Information Dissemination program for which $4 million is requested for its fourth year.

Private sector sources estimate that the public concern about uncertainty over whether exposure to electric and magnetic fields (EMF) causes health effects already costs the Nation more than $1 billion per year. Some studies suggest, but have not proven, that higher magnetic field exposures from proximity to power lines and electrical equipment result in an increase in the incidence of diseases such as leukemia, brain cancer, breast cancer, and Alzheimer's disease. The five-year EMF Research and Public Information Dissemination program and the coordinated EMF Biological Mechanisms Research program will provide the scientific information base for a risk assessment to be performed by the National Institute of Environmental Health Sciences in 1998. This should significantly reduce uncertainty on the issue and enable policy makers and the public to make informed decisions.

The following performance measures will be used by the Electric and Magnetic Fields (EMF) R&D program to track its commitments to significantly reduce uncertainty on this potential health issue and enable policy makers and the public to make informed decisions.

1996-1997 Performance Measures

-- Obtain matching non-Federal contributions for the EMF Research and Public Information Dissemination program.

-- Disseminate current and credible information on the issue, to all stakeholders and other interested parties.

1998-1999 Performance Measures

-- Complete planned health effects research and exposure assessments leading to a risk assessment by the National Institute of Environmental Health Sciences in 1998.

-- Publish and disseminate a risk assessment (by NIEHS) concerning health effects from exposure to electric and magnetic fields.

I. Mission Supporting Goals and Objectives: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

E. CLIMATE CHALLENGE: DESCRIPTION, BENEFITS, AND PERFORMANCE MEASURES

Climate Change Action Plan -- Partnerships for Technology Introduction: The mission of the Climate Challenge program is to encourage the electric utility industry to voluntarily reduce, avoid, or sequester greenhouse gas emissions using currently available, cost-effective ("no-regrets") means. The program is a joint initiative of the electric utility industry and the Department of Energy in response to the 1992 Framework Convention treaty. It was formally launched in April 1994 through the signing of a Memorandum of Understanding between all the major utility trade associations and DOE. Electric utilities voluntarily sign agreements with DOE that commit them to individualized, flexible plans to achieve reductions. In addition to making reductions in their own operations, utilities can contribute to any of nine industry-wide initiatives which the trade associations have developed in support of Climate Challenge. DOE, in return, provides technical information and support, reports on the progress of the program, and provides public recognition to utility participants.

The Climate Challenge program offers numerous benefits to the Nation. These include:

1. Demonstrates the value of using voluntary cooperation from industry, rather than traditional command-and-control regulation, to achieve environmental objectives. This program is highly popular with industry as a prudent response to the climate change issue.

2. Achieves measurable greenhouse gas reductions. As of January 1996, 577 utilities (accounting for over 60 percent of U.S. electrical generation and current carbon emissions) had either signed individually or participated in 113 agreements with DOE. DOE estimates that these reported commitments will reduce emissions by over 43 million metric tons of carbon equivalent in the year 2000. This estimate is conservative, as it does not include reductions not yet quantified, such as results from the nine industry-wide initiatives.

3. Raises awareness of the many cost-effective methods available to electric utilities to reduce greenhouse gas emissions, so that greenhouse gas mitigation is a factor considered in utility planning and management.

4. Spurs the utility industry voluntarily to make investments in new energy-efficient and renewable energy technologies and projects.

5. Strengthens the U.S. position in the on-going international climate change negotiations.

1996-2000 Performance Measures

I. **Mission Supporting Goals and Objectives:** ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

-- As a measure of the efficacy of using voluntary means rather than command-and-control regulation, the Climate Challenge program will track the continued acceptance by the utility industry of the use of voluntary, cost-effective, "no regrets" methods to reduce greenhouse gas emissions.

-- The Climate Challenge program plans to sign up over 650 utilities by 1997, and over 750 members by 1999.

II. **Funding Schedule:**

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
High Temperature Superconductivity R&D	$ 17,748	$ 22,585	$ 23,050	$ 465	+ 2
Energy Storage R&D	4,792	2,000	4,000	2,000	+100
Transmission and Distribution R&D	5,784	0	0	0	0
Electric and Magnetic Fields R&D	13,064	9,699	8,000	-1,699	- 18
Climate Challenge	0	0	1,000	1,000	>999
Total, Electric Energy Systems and Storage	$ 41,388	$ 34,284	$ 36,050	$ 1,766	+ 5

III. **Performance Summary:** ELECTRIC ENERGY SYSTEMS AND STORAGE

FY 1995 Accomplishments:

- HIGH-TEMPERATURE SUPERCONDUCTIVITY R&D ($17,748)

  -- Los Alamos made headlines world-wide by inventing a process for making long lengths of flexible superconducting wire able to carry over 1 million amperes per square centimeter (the equivalent value for copper wire is 800).

  -- Superconductivity featured in July 17 Time magazine as one of "10 areas of innovation that will affect people all over the globe." The Los Alamos breakthrough is reported.

  -- New, strong, vertically integrated teams begin development of electric utility transformers and transmission cables (an earlier team began developing cables in FY94).

1177

III. **Performance Summary**: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

-- A California utility completed initial testing of a first-of-its-kind superconducting fault current limiter in an operating substation.

- ENERGY STORAGE R&D ($4,792)

-- Characterized an engineering prototype PV/Diesel/Battery hybrid power control system during testing at Sandia Photovoltaic Systems Test Facility.

-- Designed and built the 250 kW bridge component for the PQ2000, a 2MW/10 second power quality enhancement system developed with AC Battery, Pacific Gas and Electric and the state of Wisconsin.

-- Completed fabrication and factory test of a 33kW/100kWh zinc/bromine advanced battery.

-- Confirmed the feasibility for utility applications of a 12 kWh sodium/sulphur advanced battery at the Sandia Battery Evaluation Facility.

- TRANSMISSION AND DISTRIBUTION R&D ($5,784)

-- Completed and tested a physical control model of an advanced HVDC inverter using multi-level waveform synthesis and configuration.

-- Initiated materials research to develop fabrication processes for silicon carbide and diamond materials for advanced power electronic switching devices.

-- Initiated collaborative operational tests with BPA, WAPA, the Bureau of Reclamation and EPRI to evaluate synchronized power system measurements on the electrical system for the western United States.

-- Completed operational testing of high phase order transmission concept to validate the feasibility of increasing transmission power flows.

-- Developed a distribution system simulator and used it to test the application of artificial intelligence and neural networks for increased utility distribution system control.

- ELECTRIC AND MAGNETIC FIELDS R&D ($13,064)

-- Distributed 100,000 copies (English and Spanish) of the first comprehensive federal EMF publication, "Questions and Answers about EMF" (DOE/EE-0040), and established EMF Infoline (1-800-363-2383).

III. **Performance Summary**: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

-- Updated and coordinated multi-year plan for the EMF Biological Mechanisms Research program.

-- Installed advanced EMF exposure systems at four Government laboratories for replication studies.

-- 25 biomedical multi-year research studies underway and 5 new studies initiated at NIEHS to determine possible EMF effects on cells and animals. Additional experiments underway to determine whether EMF exposure affects cell proliferation, differentiation, and immune function.

- CLIMATE CHALLENGE ($0)

CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION:
Working in collaboration with the four major national electric utility trade associations, TVA, and members of an ad hoc task force of utility representatives, DOE Solar and Renewable Resource Technology staff achieved the following key steps leading to the formation and initiation of the Climate Challenge program:

-- Obtained strong backing from industry as shown by signed greenhouse gas reduction agreements representing more than 500 electric utilities and over 60 percent of the nation's electric generation capacity.

-- Obtained commitments for reduced atmospheric emissions of over 43 million metric tons of carbon equivalent in the year 2000 through voluntary reductions.

-- Confirmed effectiveness of applying a voluntary approach to reducing emissions of greenhouse gases, rather than enforcing more traditional, command-and-control methods.

-- Catalyzed an industry-led program involving nine initiatives seeking coordinated voluntary reductions, including a $50 million private venture capital fund directed at energy-efficient and renewable energy technologies and projects.

FY 1996 Accomplishments (to date and planned):

- HIGH-TEMPERATURE SUPERCONDUCTIVITY R&D ($22,585)

-- The FY96 activities are on schedule with the 5-year requirement mandated by Section 2117 of the 1992 Energy Policy Act. In particular, progress is being made on "activities that address the development of

III. Performance Summary: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

high-temperature superconducting materials that have increased electrical current capacity, which shall be the emphasis of the program" and "activities that will assist the private sector with designs for more efficient electric power generation and delivery systems".

-- Superconductivity named as "Technology of the Year" by Industry Week magazine December 18, 1995 as a result of progress made in wire manufacture by American Superconductor Co. (MA), a principal program participant.

-- Oak Ridge and Los Alamos collaborate to reproduce the 1995 Los Alamos world record flexible wire results using an alternative lower cost process invented at Oak Ridge National Laboratory.

-- SPI teams complete initial tests of advanced, first of a kind, motor and transmission cable. Both these developments show the progress made by companies developing designs for more efficient electric systems.

- ENERGY STORAGE R&D ($2,000)

-- Install for operational testing the first PQ2000, a 2MW/10 second power quality enhancement system developed with AC Battery, Pacific Gas and Electric and the state of Wisconsin.

-- Install and operate a 32 kW/28 kWh AC Battery module with a 9 kW PV array at the Georgia Tech Natatorium, site of swimming and diving events at the 1996 Summer Olympic Games.

-- Complete the design of a transportable battery energy storage capable of delivering 1 MW for 30 seconds.

- TRANSMISSION AND DISTRIBUTION R&D ($0)

-- Proceed with the orderly closeout of the program.

- ELECTRIC AND MAGNETIC FIELDS R&D ($9,699)

-- Receive and distribute National Academy of Science report on biological effects of EMF and preliminary evaluation of potential health risks.

-- Perform experiments to determine dose/effect characteristics of reported EMF hormonal effects and conduct research to determine cellular site of EMF interactions.

1190

III. **Performance Summary**: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

-- Continue intensive communication program: answering over 10,000 calls with the EMF Infoline; distributing over 100,000 copies of Questions and Answers about EMF; and publish Questions and Answers about EMF in the Workplace.

- CLIMATE CHALLENGE ($0)

CLIMATE CHANGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION:
DOE staff, together with staff from the four major utility trade associations, achieved the following during the early implementation phase of the Climate Challenge program:

-- Increase participation of the electric utility industry in terms of number of signed agreements.

-- Contribute to a strong U.S. position during international climate change treaty negotiations.

-- Confirm strong implementation of pledges in the signed individual agreements with over 60 percent of the utility industry.

-- Attain major contributions from Climate Challenge industry-wide agreements.

FY 1997 Planned Accomplishments:

- HIGH-TEMPERATURE SUPERCONDUCTIVITY R&D ($23,050)

-- Industrial teams form to exploit the electrical wire fabrication breakthroughs at Los Alamos and Oak Ridge. World leadership will stay with the U.S.

-- Significant progress made in major development activities: transmission cables, large industrial motor, current limiter and transformer. This portfolio is the most comprehensive in the world.

-- Current limiter project completed with electric utility testing on an operating system.

- ENERGY STORAGE R&D ($4,000)

-- Complete operational testing of the PQ2000, a 2MW/10 second power quality enhancement system and install the device at a user facility for permanent service.

III. **Performance Summary**: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

-- Produce a conceptual design of a 12 kV level power quality Secure Bus device and plan for development and testing at a new substation at Sandia National Labs.

-- Design a 500 kW/500kWh prototype transportable advance battery storage system to be tested at a host utility site in FY 1998.

-- Begin testing, at a utility host site, a transportable battery energy storage system capable of 1 MW for 30 seconds.

- TRANSMISSION AND DISTRIBUTION R&D ($0)

-- None. Program closed out with prior year funds.

- ELECTRIC AND MAGNETIC FIELDS R&D ($8,000)

-- Perform experiments to identify the biophysical basis for replicated EMF biological effects and relevant EMF exposure parameters.

-- Continue intensive communication program through the EMF Infoline for telephone inquiries and the publication and distribution of booklets that are updated with the most recent information.

- CLIMATE CHALLENGE ($1,000)

CLIMATE CHALLENGE ACTION PLAN: PARTNERSHIPS FOR TECHNOLOGY INTRODUCTION:
-- Increase participation in the Climate Challenge program to include a minimum of 750 electric utilities.

-- Monitor and report major utility accomplishments during the first two years of the program.

-- Summarize and publicize individual utility actions that may be replicated by other utilities.

-- Conduct lessons-learned analysis to identify cost-effectiveness, public acceptance, and economic soundness of mitigation activities.

III. Performance Summary: ELECTRIC ENERGY SYSTEMS AND STORAGE (Cont'd)

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 465,000 in High Temperature Superconductivity R&D will result in a reduced level of design effort for advanced superconducting electrical devices and systems.

The increase of $ 2,000,000 in Energy Storage R&D proposed for FY 1997 will be highly leveraged by industry (70 percent cost share) to initiate an integrated renewable/generation/storage (RGS) system development activity which will result by FY99 in prototype turnkey modular systems. The potential of RGS systems coupled with renewable generators is estimated to further increase potential market penetration levels of renewables in 2010 by 20 percent. The increase will also provide for completion of the design study for a hybrid storage/renewable system at Sacramento Municipal Utility District and Construction of the Transportable Battery Energy Storage System. The Advanced Battery System - a modular storage system which is compact, flexible and cost-effective - will be developed.

The decrease of $ 1,699,000 in Electric and Magnetic Fields R&D is necessitated by other program priorities. The request for the fourth year of the five-year EMF Research and Public Information Dissemination program remains nominally the same. The decrease essentially occurs in the EMF Biological Mechanisms Research program and reflects a balance between these two program within the $8 million request level. Both programs are coordinated and independent. Their efforts are focussed on enabling the National Institute of Environmental Health Sciences to assess risk as one of the last activities of the five-year EMF Research and Public Information Dissemination program.

The increase of $ 1,000,000 in Climate Challenge will allow DOE to uphold its commitment to the already recruited 577 utility Climate Challenge members. DOE committed to support these members by working with appropriate organizations to remove barriers to implementation of the Climate Challenge agreements, by providing technical support, and by showcasing utility accomplishments. DOE requires resources to fulfill its commitments to the large number of Climate Challenge utilities.

23-254 96 - 38

1183

I. **Mission Supporting Goals and Objectives**:

Facility operations provide for general purpose equipment purchases and for maintaining and upgrading National Renewable Energy Laboratory facilities to assure continuity of research and integrity of effort in the conduct of research and development projects for Solar and Renewable Resources Technology activities.

II. **Funding Schedule**:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Facility Maintenance	$ 3,213	$ 500	$ 2,200	$ 1,700	+340
Construction	2,750	1,500	2,800	1,300	+ 87
Total, National Renewable Energy Laboratory	$ 5,963	$ 2,000	$ 5,000	$ 3,000	+150

III. **Performance Summary**: NATIONAL RENEWABLE ENERGY LABORATORY

FY 1995 Accomplishments:

- FACILITY MAINTENANCE ($3,213)

  Developed the conceptual and detailed designs for the construction of a Shipping and Receiving facility at NREL's South Table Mountain (STM) site to free up high bay space in the Field Test Laboratory Building (FTLB) for expanded pilot plant research. Issued construction package for bidding purposes, received and evaluated bids, and made selection of construction subcontractor.

- Developed the detailed design for the construction of the Thermal Test Facility at NREL's South Table Mountain site to provide state-of-the-art facilities for the testing of building energy systems and materials. Issued construction package for bidding purposes, received and evaluated bids, and made selection of construction subcontractor.

III. **Performance Summary**: NATIONAL RENEWABLE ENERGY LABORATORY (Cont'd)

- Completed construction of the Outdoor Test Facility for the research, demonstration, and testing of photovoltaic cells.

- Completed construction conversion of the unfinished basement in the Solar Energy Research Facility (SERF) into an electron microscopy suite.

- Completed the construction and start-up of the NREL Site Entrance Building at the STM site for the purpose of controlling access to the site.

- Completed the conceptual and detailed designs for the Industrial User Facility at the NREL National Wind Technology Center (NWTC) site for the purpose of providing a user test facility for wind turbines and blades. Issued the request for bids, evaluated bids, and awarded the construction contract.

- Developed the conceptual design for a facility to be located at NREL's mesa top to provide a user support building to house permanent restrooms, conference facilities, storage and telemetry.

- Replaced obsolete equipment at NREL for: testing and calibration of laboratory scientific instrumentation; administrative computer servers; copiers; security system; visuals development; transmission electron microscope data acquisition system and scientific computing equipment.

- CONSTRUCTION ($2,750)

  Developed the conceptual and detailed designs for the construction of the Infrastructure Improvements Project - Phase I at NREL's South Table Mountain (STM) site provides utility and circulation upgrades to support NREL site construction. Scope of construction includes extending and connecting power and telecommunications systems to existing primary distributions systems; extending fire and potable water, natural gas, sewer, and hot and chilled water system lines; and upgrading roadways, parking, walkways, lighting, and landscaping. Issued landscaping portion for bids, awarded contract, and began construction. Issued central plant portion for bids and awarded construction contract.

FY 1996 Accomplishments (to date and planned):

- FACILITY MAINTENANCE ($500)

  Provide general repair, retrofit, and maintenance of utilities, roadways and communications systems at NREL.

1185

III. Performance Summary: NATIONAL RENEWABLE ENERGY LABORATORY (Cont'd)

Replace outmoded leased telephone PBX switch at the National Wind Technology Center to accommodate growth at user facility. Provide portable manlift for access to overhead HVAC, electrical, piping, fire protection systems, and research apparatus for Field Test Laboratory Building (FTLB) and Biotechnology Research Facility (BTRF). Add servers to provide additional computer capacity for financial and administrative systems.

- CONSTRUCTION ($1,500)

Renovate NREL's Field Test Laboratory Building at the South Table Mountain site. Scope of work includes upgrading the laboratory exhaust system and converting non-laboratory space into laboratories and research support space.

FY 1997 Planned Accomplishments:

- GENERAL PURPOSE PROJECTS ($2,200)

NREL INFRASTRUCTURE - These projects provide unplanned general repair, retrofit, and maintenance for utilities, roadways, and communications systems at the National Wind Technology Center and the South Table Mountain sites.

- ASYNCHRONOUS TRANSFER MODE (ATM) SWITCHES - Obtain and install computer switches to replace outmoded, rented equipment. This new capability will provide high speed switched transfer of data and graphics information, currently transferred using local area network (LAN) and wide area network (WAN) bandwidth.

PROJECT INFORMATION SERVER - Install a high capacity UNIX server that will make project management information such as costing data, funding, procurement status, and work order available on-line and in organized formats for use by program managers.

ADMINISTRATIVE AND OTHER EQUIPMENT - Replace and update administration copiers and tools such as contour vertical bandsaw that is inadequate and badly worn, unable to handle increase in work load.

- CONSTRUCTION ($2,800)

FIELD TEST LABORATORY BUILDING (FTLB) EXPANSION, PHASE II - This project is the continuation of the previously approved Line Item Construction Project No. 96-E-100, funded in FY 1996 for $1.5M and is Phase II of a three phase project. This phase of the project will renovate and expand the laboratory and support spaces required for ongoing and evolving activities including those done in collaboration with

III. **Performance Summary**: NATIONAL RENEWABLE ENERGY LABORATORY (Cont'd)

industrial partners.

Explanation of Funding Changes FY 1996 to FY 1997

The increase of $ 1,700,000 in Facility Maintenance is required to upgrade existing space in order to provide adequate support for the existing facilities and associated research programs. This includes an increase of $220,000 in Capital Equipment required for computer and copier equipment to keep pace with technology changes and to replace older equipment that has become too expensive to repair and maintain.

The increase of $ 1,300,000 in Construction will be from $1,500,000 in FY96 to $2,800,000. The $2,800,000 is to fund only Phase II of the continuation of the FY 1996 Line Item Construction Project No. 96-E-100. This will upgrade the existing space in the Field Test Laboratory Building in order to provide state-of-the-art laboratory and support space for research activities.

1188

1.	Title and Location of Project:	2a.	Project No: 96E100
	FTLB Renovation and Expansion National Renewable Energy Laboratory Golden, Colorado	2b.	Construction Funded

8. Brief Physical Description of Project

The Field Test Laboratory Building (FTLB) expansion and renovation is a modification to an existing facility that will be accomplished in three phases. The facility is located on the existing Department of Energy 121.4 hectares (300 acre) site near Golden, Colorado. A new building addition will be added on approximately 0.2 hectares (1/2 acre) to the west of the existing FTLB site. Landscaping will be natural with minimal improved area adjacent to the building entrance.

The first phase of the project is to improved the building infrastructure. This work consists of renovation/upgrade of the laboratory ventilation and electrical power systems and a conversion of high bay space into functional laboratory. The equipment installation will increase the plant's heating capacity by 100% and the cooling capacity by 80% as well as providing 100% safety redundancy in the three laboratory ventilation systems. 232 square meters (2,500 square feet) of high bay area will be converted into two levels for use as fully functional wet laboratory space. The increase in capacity is required to support research and support functions currently performed in expensive leased space.

The second phase of the project is the design and construction of a two story building addition. The addition will consist of support space of approximately 1,227 square meters (13,200 sf). The building addition will be constructed as a B-2 occupancy in accordance with the Uniform Building Code. The expansion will be connected to the existing FTLB to utilize common utilities and allow for easy access between new and existing laboratories and support spaces.

The third phase is the design and construction of 278 square meters (3,000 square feet) building addition for high bay research laboratories. This converted space will be provided with laboratory exhaust ventilation, as well as mechanical and electrical utilities to support the research activities related to conversion of renewable energy resources to higher value fuels and chemicals. This laboratory space will be used to replace expensive leased spaces.

All phases of the project will be fully equipped with automatic fire sprinklers and alarmed for both fire and security. Ventilation systems appropriate for the types of research to be conducted will be provided.

Work performed in FY1996 includes Title I and Title II design, project management, and the initiation of physical construction.

1189

1.	Title and Location of Project:	2a.	Project No: 96E100
	FTLB Renovation and Expansion National Renewable Energy Laboratory Golden, Colorado	2b.	Construction Funded

9. Purpose, Justification of Need and Scope of Project:

The renovation of laboratory space and addition of support space will enable NREL to maximize the use of the FTLB for general renewables research and development. Completion of this project will reduce operating costs and eliminate the need for third-party participants. This facility will be designed to house process development unit (PDU) size experiments. As these technologies move from the bench scale, it is necessary to develop the overall process concept at the PDU level to verify the economic assessments to attract industry support. This project will provide laboratory space and test facilities for conducting internationally recognized research by NREL researchers, as well as through Cooperative Research and Development Agreements (CRADA) with industry. A $6.5 million total CRADA with Allied Signal is currently in place. This is the first of a series of processes to recover chemical value from mixtures of wastes that NREL is addressing.

In order for industrial partners to be able to work directly with NREL in Cooperative Research and Development Agreements, construction of the new laboratory space is needed. This also will allow NREL to eliminate any need for third party participation and will result in more cost effective research and development for the industries.

Space allocation for the renovation and expansion will include 855 square meters (9,200 sf) for high bay laboratories, 232 square meters (2,500 sf) for an experimental staging area, and 1,050 square meters (11,300 sf) of support space. This space includes new and renovated space to support expansion of the Biofuels, Biomass power and Industrial Technologies Programs (waste conversion and industrial processes).

The research requirements for thermal conversion technology require high bay research facilities equipped with industrial exhaust ventilation in order to safely conduct experiments on conversion of renewable resources to fuels. Currently, this type of research has been conducted in only one laboratory at the National Renewable Energy Laboratory (NREL) due to the limited high bay space available in current facilities. This project will allow the more efficient use of available high bay space by converting an area formerly used for administrative purposes to high bay laboratory space. The new space will provide the necessary facilities to attract and support cooperative research efforts with industrial partners.

The ventilation upgrades provided by this project are required to provide heating and cooling to the new and converted laboratory and support spaces. This work will also provide for ventilation redundancy required for safe operation of laboratory equipment.

1190

1. Title and Location of Project:

FTLB Renovation and Expansion
National Renewable Energy Laboratory
Golden, Colorado

2a. Project No: 96E100

2b. Construction Funded

10. Details of Cost Estimate:

	Unit Cost	Item Cost	Total Cost
a. Design and Management Costs			$ 800
1. Engineering design and inspection at approximately 12% of construction costs (item c)		$ 600	
(a) Title I & Title II Design	$ 318		
(b) Title IIA & Title IIB	242		
(c) Inspection & Testing Laboratory Services	40		
2. Construction Management Costs		0	
3. Project Management at approximately 4% of construction costs (item c)		200	
b. Land and land rights			0
c. Construction Costs*			4,997
1. Improvements to land**		35	
2. Buildings - approx. 2,138 gsm @ $2,227/gsm (23,000 gsf @ $207 gsf)***		4,761	
3. Other structures		0	
4. Utilities		0	
5. Special Facilities****		201	
d. Standard Equipment			0
e. Major computer items			0
f. Removal cost less salvage			0
g. Design and project liaison, testing, checkout and acceptance			0
Subtotal			5,797
h. Contingencies at approximately 14% of item c			703
i. Total line item cost			6,500
j. Non-Federal contribution			0
k. Net Federal total estimated cost (TEC)			$ 6,500

1191

1. Title and Location of Project:

FTLB Renovation and Expansion
National Renewable Energy Laboratory
Golden, Colorado

2a. Project No: 96E100

2b. Construction Funded

10. Details of Cost Estimate (continued):

* Based on preliminary cost estimate escalated to the midpoint of construction
** Includes costs for modifying the roadway
*** Average per gsm/gsf costs; project encompasses both renovation of existing space and addition of new space
**** Includes laboratory casework

11. Method of Performance

Design and inspection services will be accomplished by fixed price contract(s) with an Architect Engineering firm with additional effort by operating contractor and government employees. Construction and procurement will be by fixed price contract(s) awarded on the basis of competitive bids.

12. Schedule of Project Funding and Other Related Funding Requirements:

	Prior Years	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	Total

   (b) Operating expense-funded equipment: None.
   (c) Inventories: None.

1193

1.	Title and Location of Project:	2a.	Project No: 96E100
	FTLB Renovation and Expansion National Renewable Energy Laboratory Golden, Colorado	2b.	Construction Funded

13. Narrative Explanation of Total Project Funding and Other Related Funding Requirements:

2. Other project costs
   (a) R&D necessary to complete construction: No other project funding required.
   (b) Conceptual design: No narrative required.
   (c) Decontamination and decommissioning (D&D): None
   (d) NEPA documentation costs: None.
   (e) Other project related costs: None.
   (f) Non-Federal Contributions: None.

b. Related annual funding
   1. Facility operating costs - Included are the salaries and expenses for the NREL Facilities organization and the cost of various subcontracted maintenance and operations activities, in addition to custodial services.
   2. Facility maintenance and repair costs - Include estimated maintenance and repair costs.
   3. Programmatic operating expenses directly related to the facility - None.
   4. Capital equipment not related to construction but related to the programmatic effort in the facility - Includes pyrolysis processing equipment.
   5. GPP or other construction related to the programmatic effort in the facility - None.
   6. Utility costs - Includes estimated annual utilities costs.
   7. Other costs - None.

14. Incorporation of fallout shelters in future federal buildings:

Executive Order 12656 and DOE Order 6430.1B do not specifically require the provision of fallout shelters. The FTLB does not contain dual-purpose space which could be easily and economically converted to fallout shelters. Therefore, no provisions for fallout shelters are included in this project.

1. Title and Location of Project:	2a. Project No: 96E100
FTLB Renovation and Expansion National Renewable Energy Laboratory Golden, Colorado	2b. Construction Funded

15. Federal compliance with pollution control standards:

The total estimated cost of the renovation and expansion of the FTLB includes the cost of measures necessary to assure compliance with Executive Order 12088. Sanitary waste will be discharged to an existing sewer system connected to adequate sewage facilities. Chemical and biological wastes will be collected in containers at the point of production and disposed of in accordance with applicable standards to ensure public safety. Airborne contaminants will be treated as required before being released.

16. Evaluation of flood hazard:

This project will be located in an area not subject to flooding determined in accordance with Executive Order 11988.

17. Compliance with the National Environmental Policy Act, floodplains/wetlands review requirements and other relatedenvironmental statutes:

The project is not located in a floodplain/wetland area. In accordance with environmental regulations, NEPA documentation will be supplied to the Golden Field Office. This project will comply with all Federal, State and local regulations and environmental statutes.

18. Accessibility for the handicapped:

This project will be designed to be accessible to the handicapped in accordance with the Architectural Barriers Act, Public Law 90-480, and the Americans With Disabilities Act. Implementation will be performed in accordance with the Federal Property Management Regulations 41 CFR 101-91.6.

19. Supplementary Project Data for Facility Utilization

This project will provide new space and capacity. Supplemental information is provided as an attachment.

20. Safe and Healthful Workplace:

The total estimated cost for the FTLB Renovation and Expansion includes amounts required to ensure that the facility will provide a safe and healthful workplace consistent with the standards of Section 19 of the Occupational Safety and Health Act of 1970, provisions of Executive Order 12196 and Safety and Health Provisions for Federal Employees of the Secretary of Labor listed in 29 CFR Chapter XVII, Part 1960.

1195

1. Title and Location of Project:	2a. Project No: 96E100
FTLB Renovation and Expansion National Renewable Energy Laboratory Golden, Colorado	2b. Construction Funded

21. Compliance with Energy Conservation Criteria

The total project cost includes the cost of complying with: (1) Title 10, Code of Federal Regulations, Part 435, Performance Standards for New Commercial and Multi-Family High Rise Residential buildings, of January 39, 1989, (2) DOE 6430.1B, General Design Criteria, which requires preparation and submission of energy conservation reports, and (3) Requirements for Private Sector Energy Expert review of design for new facilities larger than 929 square meters (10,000 square feet) as required by the Secretary of Energy's memorandum of November 12, 1991, inclusion of additional cost-effective energy efficient technologies, and Executive Order 12902.

Supplementary Project Data for Facility Utilization: (continued)

CHANGES TO ASSET LEVELS RESULTING FROM THIS PROJECT:

f.	The additional assets created in this category by the project:	2,138 SM 23,000 SF
g.	Less, assets removed from this category through excessing, demolition, etc:	-0-
h.	Equals net increase/(decrease) of assets in this category due to the project:	2,138 SM 23,000 SF

PROJECTED ASSET STATUS AFTER COMPLETION OF THIS PROJECT:

i.	Existing excess of (deficiency) of adequate assets, plus this project's increases, equal excess of (deficiency) of adequate assets projected for this category:	-0-

1198

SOLAR AND RENEWABLE RESOURCE TECHNOLOGIES

PROGRAM DIRECTION - EE

I. Mission Supporting Goals/Ongoing Responsibilities:

A. Program Description

This program provides the staffing resources and associated funding to support the overall management of the Solar and Renewable Resource Technologies Program and enables the diverse array of solar and renewable programs to work more strategically and function integrally. This includes three principal components: (1) Headquarters Executive Management; (2) Headquarters Project Management; and (3) Program Implementation at the Golden Field Office and the Idaho Operations Office. These staff perform all project management activities, ranging from policy development and long-range planning to general administration. It includes functions such as: (1) preparation of technical research and development plans; (2) assessment of scientif' and technical needs and priorities, development and defense of budgets; (3) review, evaluation and fundin of research proposals; (4) monitoring evaluation and directing laboratory work and allocation of resources (5) oversight of university and industrial research programs; (6) control of interagency liaison and negotiations; (7) development of corporate goals, multiyear planning, corporate formulation of budget requests and presentation and explanation of those requests; (8) management and execution of corporate-level communications, information transfer and outreach to EE customers and stakeholders; and (9) the conduct, planning and reporting of policy analysis, program benefits assessment, performance measurement and program performance assessment. The program benefits estimates and performance measures cited throughout this budget request have been developed or facilitated through this function. In addition to providing the staffing resources, this account provides essential contract support for the operation of the Golden Field Office.

From the start of FY 1995 through the end of FY 1997, FTEs are projected to be reduced over 20 percent to support a down-sized organization being implemented in the Solar and Renewable Resource Technology Program Direction account. A total of 16 FTEs were reduced in FY 1995. This was a 10 percent reduction from FY 1994 (based on an End of Year (EOY) personnel strength of 164 FTEs in FY 1994 to an EOY personnel strength of 148 FTEs in FY 1995). From the end of FY 1995 thorough the end of FY 1997, FTEs will be reduced an additional 19 FTEs. The new organization accomplishes DOE Strategic Alignment goals and helps enhance streamlining activities consistent with the Government Performance and Results Act. For example, layers of management and third-tier organizations will no longer be necessary and the supervisory span of control will be increased.

B. Estimates of Benefits

The products and services provided by the Program Direction function enable the Solar and Renewable Resource programs to meet their mission more effectively. As such, many of the benefits are those of strategic management and integration, reduced duplication and redundancy which cannot be described quantitatively.

I. Mission Supporting Goals/Ongoing Responsibilities: PROGRAM DIRECTION - EE (Cont'd)

C. Performance Goals

Key FY 1995 accomplishments are:

- See detailed accomplishments in Section III.

Key FY 1996 performance indicators are:

- Meet the Secretary's Critical Success Factor commitments for FY96, particularly focusing on human resources, customers, management, leadership and measurement.
- Develop a portfolio management system based upon strategic criteria and measures.
- Simplify and integrate budget development, presentation and information management.
- Develop the Solar and Renewable Resource plan for Government Performance and Results Act of 1993 requirements.
- Coordinate Solar and Renewable Resource needs, cross-cut activities and RE integration with other DOE and external programs.

Key FY 1997 performance indicators are:

- Meet or exceed the Secretary's Critical Success factor commitments for FY97, particularly focusing on human resources, customers, management, leadership and measurement.
- Improve the integration and corporate utility of the portfolio management system.
- Initiate the Solar and Renewable Resource plan for Government Performance and Results Act of 1993.
- Coordinate Solar and Renewable Resource needs, cross-cut activities and RE integration with other DOE and external programs.
- Detailed accomplishments are provided in the Performance Summary Section.

1998-2000 Performance Measures

- Revise the EE Strategic Plan for renewable energy programs based on market and technology changes.
- Refine the Strategic Principles planning process to facilitate consistent planning and decision-making across programs and sectors.
- Achieve a customer service rating of good to excellent from 90% of EE customers.
- Use comprehensive, state-of-the-art benefits estimates and performance measures to make effective ongoing decisions and resource allocations.
- Implement the Government Performance and Results Act.
- A resource summary for FY 1995 through FY 1997 follows:

II. Funding Table: PROGRAM DIRECTION - EE

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	FY 1996 Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request

Budget Authority	$17,792		+$13,975	$13,975	$17,301

1201

III. Performance Summary: PROGRAM DIRECTION - EE

FY 1995 Accomplishments:

- Supported 148 FTEs including 124 FTEs at Headquarters and 24 FTEs and in the Field to plan and implement the Solar and Renewable Resource Technologies Programs.

- Provided essential contractual services to support the operation of the Golden Field Office and analytical, professional, and administrative services for all Solar and Renewable Programs.

- Included $2,485,000 for the Working Capital Fund for administrative activities such as rent, automated office support, contract close out, contract audits, SES awards, telephone services, postage, printing, graphics, and similar services previously included in the Departmental Administration account.

- Implemented a major realignment effort using the Department's five step process: Functional analysis, requirements analysis, process re-engineering, cost analysis, and structural analysis. This process identified savings in FTE usage and a better organizational design structure to be used as a potential model for other EE sectors. As a result, 16 Ftes were reduced in FY 1995, or 10 percent of the staff.

- Developed a DOE Pilot Program to improve and/or replace administrative processes in recruitment and staffing actions. This program created the EE/HR Centralized Personnel Actions Team comprised of EE and Human Resources (HR) specialists on-site with EE staff to provide effective and expedited personnel action assistance in the EE organization. To date, personnel actions have been reduced by over 50 percent.

- Developed a program to assist employees in preparing themselves for the strategic alignment implementation and possible career outplacement. Workshops (such as Managing Change and Transition, Career Assessment, and Mastering Your Career) focus on providing tangible, usable products, such as skills inventories and resumes. These workshops assist employees who are seeking jobs in the private sector and provide them with a better understanding of their strengths, skill needs, and capabilities.

- Established the EE Customer Service Center, which offers local and "800" numbers for immediate access to EE staff and information. Callers receive immediate response to inquiries and are provided informational materials and offered follow-up services, such as meetings with appropriate technical experts. In no case is a caller required to make more than that first phone call.

- Developed Strategic Principles planning process that allows criteria-based decision-making.

- Developed an EE-wide customer service plan to facilitate the transition to a world-class customer service organization.

- Developed a comprehensive set of estimates of benefits and performance measures for Energy and Water Development programs.

- Provided corporate-level management of the renewable energy deployment initiatives in the Administration's Climate Change Action Plan.

III. Performance Summary: PROGRAM DIRECTION - EE (Cont'd)

- Participated as one of the Government Performance and Results Act-National Performance Review Reinvention Lab pilots.

FY 1996 Accomplishments (to date and planned):

- Supported 142 FTEs including 118 FTEs at Headquarters and 24 FTEs in the Field to plan and implement the Solar and Renewable Resource Technologies Programs.

- Provided essential contractual services for the operation of the Golden Field Office and analytical, professional, and administrative services for all Solar and Renewable Resource Technologies Programs.

- Included $2,517,000 for the Working Capital Fund for administrative activities.

- Established a Logistics Services Improvement Team to identify opportunities for organizational and process improvements. The team identified approximately 60 services provided by EE staff in coordination with HR, including office space relocations, small purchases, badging and new employee orientation, time and attendance administration, conference management, etc. The Logistics Services Improvement Team recommended, and EE established, a centralized and Local Area Network (LAN) based Employee Logistics Service Center as a single point of contact for information and assistance for the full range of EE staff logistics-related actions.

- Developed, with DOE's National Treasury Employees Union (NTEU) Chapter, the Department's Pilot Telecommuting Partnership. The Pilot program provides EE data to identify additional opportunities for job-sharing and similar initiatives. EE and the Office of the Executive Secretariat have teamed to develop the Department's Pilot Document On-Line Coordination System (DOCS) to improve processes for executive document preparation and control. The Pilot program fully automates, simplifies, and expedites the current paper-intensive system for responding to and initiating executive correspondence.

- De-layer Project Management. Identified which projects should be transferred to the field offices and which should remain at HQ. Also improved the balance between program and project management skills which yielded higher quality project management with a flatter organization.

- Reviewed the ability to train clerical staff who provide support in such areas as graphics, conference planning, customer service, and database operation and converted them to administrative assistants who can perform secretarial duties as well.

- Provided real time access, full E-mail access across all DOE Solar and Renewable programs, and full internet access for "chat" mode operation from both office and remote computers as well as training on efficiencies that can be gained by additional electronic communication.

- Applied the Strategic Principles criteria-based planning process to FY 1997 budget decision-making to develop an efficient and balanced FY 1997 budget request.

III. Performance Summary: PROGRAM DIRECTION - EE (Cont'd)

- Effectively communicated budget priorities and information to Congress and responded in a timely fashion to Congressional inquiries.
- Began to implement an EE-wide customer service plan to facilitate the transition to a world-class customer service organization.
- Developed a comprehensive set of peer-reviewed estimates of benefits for all Energy and Water Development program planning units and a comprehensive set of performance measures across all EWD programs.
- Reported Government Performance and Results Act-National Performance Review Reinvention Lab pilot 2 year results.

FY 1997 Planned Accomplishments:

- Supports a total of 129 FTEs including 111 FTEs at Headquarters and 18 FTEs in the Field to plan and implement the Solar and Renewable Resource Technologies Programs.
- Provides essential contractual services for the operation of the Golden Field Office and analytical, professional, and administrative services for all solar and Renewable Energy Programs.
- A total of $2,881,000 is requested for the Working Capital Fund (WCF) to provide for activities such as rent, automated office support, contract close out, contract audits, SES awards, telephone services, postage, printing, graphics, and similar services previously included in Departmental Administration.
- The Working Capital Fund will permit the costs of administrative services, which are common to all recipient organizations, to be charged directly to those organizations. The Fund offers a variety of benefits. For example, it will enhance the potential for reducing administrative costs by permitting managers to reduce the consumption and costs for goods and services previously perceived as "free", it will promote more efficient allocation of goods and services, and it will permit the Solar and Renewable Resource programs to move toward implementing the "fully loaded cost" estimation sought by the Conference Managers in the FY 1996 Energy and Water Appropriations Report.
- Develop a new Strategic Plan for renewable energy programs based on customer input.
- Refine the Strategic Principles planning process to perform scenario-based portfolio analysis and decision-making to ensure maximum returns under fiscal constraints.
- Improve the budget presentation process that continues to effectively communicate priorities and information and respond promptly to Congress.
- Achieve a customer service rating of good to excellent from a majority of EE customers.

III. Performance Summary: PROGRAM DIRECTION - EE (Cont'd)

- Develop a comprehensive, integrated, peer reviewed, state-of-the-art system of estimates of benefits and performance measures across all solar and renewable energy programs.

- Apply the lessons learned from participation in the Government Performance and Results Act-National Performance Review Reinvention Lab pilot to RE GPRA requirements.

IV. Explanation of Funding Changes FY 1996 to FY 1997

The FY 1997 increase of $3,326,000 in Program Direction does not include unobligated carryover funds of $1,810,000 available in FY 1996. Specifically, total FY 1996 funding for Program Direction is $15,785,000 including $11,458,000 (FY 1996 new BA), plus $1,810,000 from FY 1995 unobligated carryover funds, and $2,517,000 for the Working Capital Fund. Therefore the actual change from FY 1996 to FY 1997 is $1,516,000.

The $1,516,000 includes the net effect of: (a) an increase of $408,000 for Federal employee pay raise and buyouts; (b) a reduction of $109,000 for travel; (c) an increase of $853,000 for analytical studies to support the development of performance measurement data for the Solar and Renewable Resource Technologies programs; and (d) and an increase of $364,000 for administrative services provided from the Working Capital Fund.

V. Explanation of Average FTE Costs:

Overall Program Direction:
Average FTE costs for all Solar and Renewable Resource Technologies Program Direction are: $120,000 in FY 1995, $111,000 in FY 1996, and $134,000 in FY 1997. The lower average FTE costs in FY 1996 reflect reductions in Other Related Expenses for contractual services primarily for the development of performance measurement data for the Solar and Renewable Resource Technologies programs. An explanation of the average FTE costs for each field component and Headquarters follows.

Golden Field Office:
Average FTE costs of $139,000 in FY 1995 are reduced to $129,000 in FY 1996. This is primarily the result of the Federal employee pay raise in FY 1996 and reductions in contractual services for the operation of the Golden Field Office. Average FTE costs of $167,000 in FY 1997 reflect small increases for Federal employee pay raise and the full annual costs for contractual services for the operation of the Golden Field Office.

Idaho Operations Office:
Average FTE costs include nominal increases in FY 1996 and FY 1997 for the Federal employee pay raise.

1205

V. Explanation of Average FTE Costs: PROGRAM DIRECTION - EE (Cont'd)

Headquarters:
Average FTE costs are $118,000 in FY 1995 and are reduced to $108,000 in FY 1996. The reduction reflects the Federal employee pay raise in FY 1996 and reductions in Federal travel and contractual services. Contractual services in FY 1996 are limited to $2,517,000 for the Working Capital Fund. Average FTE costs of $130,000 in FY 1997 reflect small increases for Federal employee pay raise and an increase of $964,000 for Other Related Expenses to support (a) the Working Capital Fund which increases by $364,000 (from $2,517,000 in FY 1996 to $2,881,000 in FY 1997); and (b) an increase of $600,000 to support the development of performance measurement data for the Solar and Renewable Resource Technologies programs.

IN-HOUSE ENERGY MANAGEMENT

PROGRAM MISSION

I.A. Statement of Mission

The In-House Energy Management (IHEM) Program, under the direction of the Federal Energy Management Program, provides the necessary resources and services to reduce energy and water consumption, improve energy efficiency, and reduce utility costs throughout the Department's facilities and operations. This is primarily accomplished through the implementation of retrofit projects and modifications which save energy or water, and have a high return on investment. IHEM provides additional direct support for DOE Energy Cost Savings through training, energy awareness, new building design reviews, and policy guidance.

Projects that are identified compete for funding on a DOE-wide basis, and are selected to maximize the economic return, while reducing environmental pollution and supporting the established goals of the Department's Strategic Plan. Project development activities include energy and water conservation surveys, specific energy projects or central plant feasibility studies, and funding to ensure energy conservation projects are put in place. Many of the proposed projects are accomplished through leveraging with non-federal resources, such as utility rebates and private-sector financing. The program has a return on investment of approximately 25 percent, and has been identified as part of the President's Investment Program for Federal Facility Energy Efficiency since FY 1994. The net return on each $1 invested at DOE facilities for energy efficiency is approximately $5 in direct energy and/or water savings, not including environmental and other benefits.

IHEM's leadership in these areas extends beyond the Department and is a model for other Federal Agencies as exhibited by the Department's reduction in energy consumption in buildings by 24 percent since FY 1985, already achieving the FY 2000 goal of the Energy Policy Act of 1992. However, more can be accomplished in energy efficiency, and will need to be to reduce unnecessary costs in support of the President's balanced budget and to meet the Energy Policy Act requirement of implementing all projects with less than a 10 year payback period and the Executive Order goal of a 30 percent reduction by FY 2005.

1207

I.B. Program Benefits

The benefits of the In-House Energy Management Program have been projected based on maintaining the rate of reduction in energy consumption experienced over the past ten years and accomplishing the Department of Energy's goals and objectives as required by the Energy Policy Act of 1992 and Executive Order 12902, as stated in I.C., in the years 2000 and 2005, in the objectives section below of the program overview. These projected benefits result directly from effectively managing the Department's energy utilization in buildings and energy intensive operations. Savings projected include anticipated savings from upgrading and retrofitting of existing facilities, as well as the impacts of increased purchasing and utilization of high efficiency energy consuming products under the Federal Procurement Challenge. Achieving these savings is dependent upon a steady investment in the funding of energy efficiency projects at Department of Energy facilities nation-wide. Additional benefits of energy management, although not currently projected, will accrue as well, including increased worker productivity and improved health and safety conditions.

IHEM Quality Metrics Based Benefits

Metric*(Annual savings achieved in year)	2000	2010	2020
Total Primary Energy Displaced (Quads)	.005	.0176	.0329
Total Cost Savings in Year** (1995/$-Billions)	.0325	.1253	.2538
Carbon Equivalent Savings (MMTCE)***	.111	.381	.710

*Note: Energy cost savings of IHEM Program from FY 1997 forward will be a cumulative $74.1 million in 2000, $855.1 million in 2010, and $2.8 billion in 2020.
**Actual Federal deficit reduction potential is dependent upon the mix of financing used to achieve the savings. The higher the proportion of private sector funding utilized (ESPCs), the lower the potential deficit reduction due to added cost of funds acquisition.
***Does not include enhanced carbon reductions of 1 MMTCE in 2000, 1.3 MMTCE in 2010, and 1.6 MMTCE in 2020 due to a steam plant conversion demonstration.

PROGRAM MISSION - IN-HOUSE ENERGY MANAGEMENT (Cont'd)

I.C. Objectives of the IHEM Program are to demonstrate leadership as a model for energy management within the Federal Government by:

1. Implementing energy and water conservation cost saving projects at DOE sites consistent with the requirements of Energy Policy Act of 1992 (EPAct), Public Law 102-486; the National Energy Conservation Policy Act (NECPA), Public Law 95-619; and Executive Order 12902. Specifically, this includes the following:

a. EPACT requires agencies by the year 2000 to reduce energy consumption in federal facilities by 20% compared to 1985, based on BTU usage per square foot, while Executive order 12902 adds an additional goal of reducing energy consumption by 30% by the year 2005.

b. EPACT also requires agencies by 2005 to install, to maximum extent practicable, all energy and water conservation measures with payback periods of less than ten years.

c. Executive Order 12902 includes agency requirements for: increasing energy efficiency in industrial facilities by 20 percent by FY 2005; conducting comprehensive facility audits of 10 percent of its facilities each year; increasing the use of solar and renewable energy sources; reducing the use of petroleum; and constructing new facilities to meet or exceed energy performance standards.

2. Demonstrating at DOE sites new or emerging state-of-the-art energy or water saving technologies which improve energy efficiency and reduce operating costs.

3. Initiating a program with other DOE organizations using energy savings performance contracting that achieves an integrated approach for replacement of chillers including other cooling-load reduction measures and supporting the regulatory phase-out of chlorofluorocarbons.

4. Increasing the use of energy savings performance contracts, and specifically to implement the National Performance Review initiative to save utility costs by replacing the Department's aging steam plants through private sector investment.

5. Annually reducing the Department's energy consumption and costs for utilities through the accomplishment of the aforementioned objectives.

1209

PROGRAM MISSION - IN-HOUSE ENERGY MANAGEMENT (Cont'd)

I.D. Performance Measures

The following performance measures will be used by the IHEM Program to track its commitments to meeting its 2005 goal of reducing energy consumption by 30%:

1996 Performance Measures:
-- Complete 1 Energy Savings Performance Contract at a Departmental facility.

1997 Performance Measures:
-- Conduct comprehensive facility audits on at least 10% of Departmental facilities.
-- Reduce annual buildings energy consumption per square foot by at least 1%.
-- Initiate at least 2 additional successful Energy Savings Performance Contracts.

1998-1999 Performance Measures:
-- Reduce DOE utility costs by greater than $5 million per year.
-- Reduce annual buildings energy consumption per square foot by at least 1%.
-- Demonstrate one new or emerging technology.

2000 Performance Measures:
-- Reduce DOE energy consumption by 25% by FY 2000.
-- Reduce annual DOE utility costs by greater than $5 million.
-- Reduce annual buildings energy consumption per square foot by at least 1%.

Significant Accomplishments in 1995 and Program Shifts:

-- 23.2 percent reduction in DOE buildings energy consumption per square foot as compared to FY 1985 resulting from cumulative efforts, already achieving the FY 2000 goal of the Energy Policy Act and continuing toward the FY 2005 goal of Executive Order 12902.

-- 45.8 percent reduction in metered process energy consumption per square foot as compared to FY 1985 resulting from cumulative efforts.

-- Reduction in the Department's annual utility costs by greater than $180 million as compared to FY 1985.

-- The IHEM Program is increasing reliance on leveraging its resources with both private sector funding, including utility rebates and energy savings performance contracts.

IN-HOUSE ENERGY MANAGEMENT

PROGRAM FUNDING PROFILE

1211

IN-HOUSE ENERGY MANAGEMENT

IHEM FACILITIES OPERATIONS

I. **Mission Supporting Goals and Objectives**:

The goal of the In-House Energy Management (IHEM) Program is to reduce consumption and utility costs for the Department of Energy's (DOE) facilities. IHEM Facilities Operations is to ensure the funding of retrofit projects and modifications that are identified as part of IHEM Program Operations. Projects which are identified compete for financing support on a DOE-wide basis and are selected to maximize the DOE's economic return. Continuation of an annual program of quick payback retrofit projects for the DOE's facilities reduces outyear utility costs, provides a return on investment of 25 percent, and will meet goals set by legislation. IHEM Program Operations is structured to provide on-site training for improved operation of central plants, and survey and study facilities, utilities and processes owned by the DOE, in order to support the implementation of retrofit projects and modifications which save energy and have a high return on investment.

1212

II. **Funding Schedule**:

Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Conservation Projects					
Integrated Chiller Retrofit	$ 0	$ 0	$ 0	$ 0	0
Other Conservation Projects	24,700	0	1,759	1,759	>999
Subtotal, Conservation Projects	$ 24,700	$ 0	$ 1,759	$ 1,759	>999
IHEM Program Operations					
Surveys, Studies, and Operator Training	$ 5,349	$ 0	$ 3,500	$ 3,500	>999
Subtotal, IHEM Program Operations	$ 5,349	$ 0	$ 3,500	$ 3,500	>999
Total, IHEM Facilities Operations	$ 30,049	$ 0	$ 5,259	$ 5,259	>999

III. **Performance Summary**: IHEM FACILITIES OPERATIONS

FY 1995 Accomplishments:

- Other Conservation Projects ($24,700)

  65 retrofit/construction projects funded in FY 1995, totaling over $24 million in construction funding.

  Projects funded and scheduled for completion within two years, will save over 500 billion Btu's and over $6 million in utility costs annually.

  23.2 percent reduction in DOE buildings energy consumption per square foot as compared to FY 1985, already achieving FY 2000 requirement of EPACT.

  45.8 percent reduction in metered process energy consumption as compared to FY 1985.

  Reduction in the Department's annual utility costs by greater than $180 million as compared to FY 1985.

- Surveys, Studies, and Operator Training ($5,349)

  Approximately 85 facility surveys and studies were funded. These surveys and studies represent over 20 million square feet and over 15 percent of the facility square footage in DOE, meeting the 10 percent requirement of Executive Order 12902. These efforts identify future retrofit projects and no- or low-cost opportunities to reduce energy and water consumption.

  Approximately 25 central plant operators were trained, and over $100,000 in energy conservation savings were identified during the training at the sites.

  IHEM hosted one DOE energy coordinator's conference to address pertinent issues such as the phase-out of chlorofluorocarbons (CFCs) and coordinated the implementation of cost saving energy projects.

FY 1996 Accomplishments (to date and planned):

- Other Conservation Projects ($0)

  Will be accomplished through private sector financing using energy savings performance contracting and utility incentives to reduce operating and utility costs.

  Planning on working towards completion of all retrofit projects that have been previously funded.

III. Performance Summary: IHEM FACILITIES OPERATIONS (Cont'd)

Planning on completing 1 Energy Savings Performance Contract at a departmental facility.

- Surveys, Studies, and Operator Training ($0)

Planning on working towards completion of all studies that have been previously funded.

FY 1997 Planned Accomplishments:

- Other Conservation Projects ($1,759)

Only retrofit/construction projects that do not qualify for private sector financing will be funded solely by appropriated funds in FY 1997.

The majority of projects that will be accomplished will be funded through private sector financing using energy savings performance contracting and utility incentives.

- Surveys, Studies, and Operator Training ($3,500)

Planning to initiate at least 2 Energy Savings Performance Contracts.

Planning to survey approximately an additional 10 percent or 15 million square feet of DOE facilities for energy and water cost savings to meet the requirements of Executive Order 12902.

Planning to reduce annual buildings energy consumption per square foot by at least 1%.

Explanation of Funding Changes FY 1996 to FY 1997

The net change of $ 0 in Integrated Chiller Retrofit will eliminate initiation of a 2-year experimental program to provide joint funding with other DOE organizations for integrated chiller replacement projects.

The increase of $ 1,759,000 in Other Conservation Projects will result in minimal IHEM Program efforts to retrofit DOE facilities to reduce energy costs and will increase future energy budgets by more than $80 million.

III. **Performance Summary**: IHEM FACILITIES OPERATIONS (Cont'd)

The increase of $ 3,500,000 in Surveys, Studies, and Operator Training will result in reduced level of effort with 30 less surveys performed, and $10 million in retrofit projects that will not be identified.

IN-HOUSE ENERGY MANAGEMENT

PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities:

This program provides the staffing resources and associated funding to support the overall direction of the In-House Energy Management (IHEM) Program. This includes providing direction, guidance and funding for the survey and study of facilities, utilities and processes owned by the DOE, in order to identify retrofit projects and modifications which save energy and have a high return on investment. These staff perform all project management activities ranging from policy development and long-range planning, to general administration. This includes functions such as: (1) setting priorities and selection of studies and retrofit projects to be funded; (2) monitoring and evaluation of the status of funded studies and retrofit projects; (3) review of new building designs to assure compliance with energy standards and requirements; (4) development of performance measures and criteria for energy management, and facilitating their incorporation into the Management and Operating contracts; (5) providing technical assistance, guidance, funding and coordination for the development of energy savings performance contracts; (6) reporting on the annual consumption and progress of the program towards the goals and requirements of EPACT and Executive Order 12902; (7) energy awareness and outreach activities; and (8) development and defense of budget submissions.

Performance indicators are: Reduction in annual buildings energy consumption per square foot of at least 1 percent.

FTEs were reduced by 1 FTE in FY 1996 and 1 in FY 1997 which is a 40% reduction. Program reductions will have adverse impacts on the program.

II. Funding Schedule: PROGRAM DIRECTION (Cont'd)

	FY 1995 Comparable Approp.	FY 1996 Original Approp.	FY 1996 Real & Comp Adjustments	FY 1996 Comparable Approp.	FY 1997 Budget Request
Headquarters					
Salary and Benefits	$462		+$331	$331	$281
Travel	$ 11		+$ 11	$ 11	$ 10
Support Services	$110		$ 0	$ 0	$150
Total	$583	———	+$342	$342	$441
Full Time Equivalents	5		4	3	3
Average	$117		+$ 86	$147	$147

III. Performance Summary:

FY 1995 Accomplishments:

-- Supported a total of 5 FTEs at Headquarters to plan and implement the In-House Energy Management Programs. This staff was funded from Departmental Administrative Account.

-- 23.2 percent reduction in DOE buildings energy consumption per square foot as compared to FY 1985 resulting from cumulative efforts, already achieving the FY 2000 requirement of the Energy Policy Act and continuing toward the FY 2005 goal of Executive Order 12902.

-- 45.8 percent reduction in metered process energy consumption per square foot as compared to FY 1985 resulting from cumulative efforts.

-- Reduction in the Department's annual utility costs by greater than $180 million as compared to FY 1985.

FY 1996 Accomplishments (to date and planned):

-- A total of 4 FTEs will perform closeout functions for the IHEM Program, in addition to managing the remaining IHEM projects.

-- Complete 1 Energy Savings Performance Contract at a Departmental facility using private sector funding.

III. Performance Summary: PROGRAM DIRECTION (Cont'd)

FY 1997 Planned Accomplishments:

-- A total of $440,608 is requested for 3 FTEs to perform the IHEM Program.

-- Planning to survey over 10 percent of DOE facilities to meet the requirements of Executive Order 12902.

-- Planning to reduce annual buildings energy consumption per square foot by at least 1%.

-- Planning to initiate at least 2 Energy Savings Performance Contracts.

IV. Explanation of Funding Changes FY 1996 to FY 1997

A net increase of $ 99,000 is the result of (1) a staffing reduction of 1 FTE ($51,000); and (2) support services in FY 1997 to assist in closing out and management of remaining IHEM projects ($150,000).

V. Explanation of Average FTE Costs:

FY 1995 average FTE costs of $117,000 are based on 5 FTE's and $110,000 for support services contracts. FY 1996 average FTE costs of $86,000 are based on 4 FTEs and no funding for support service contracts; therefore the average FTE cost is lower. Average FTE costs increase in FY 1996 primarily due to needed support services of $150,000.

3. Date A-E work initiated: 2nd Qtr. FY 1997

3a. Date physical construction starts: 4th Qtr. FY 1997

4. Date construction ends: 4th Qtr. FY 1999

5. Previous cost estimate: None
Date:

6. Current cost estimate: $1,759
Date: January 1996

7. Financial Schedule

Fiscal Year	Authorizations	Appropriations	Obligations	Costs
1997	$1,759	$1,759	$1,759	$1,000
1998				500
1999				259

8. Project Description, Justification and Scope:

This project provides for the design and construction of various small retrofit projects to reduce energy consumption. These small modifications will be selected on the basis of return on investment and energy savings. Projects compete on a DOE-wide basis for funding under this lump sum item, thus assuring the greatest return and greatest energy savings per investment dollar for the Department of Energy. The average payback for this line item based on past experience, is slightly greater than 3 years.

CONSTRUCTION PROJECT DATA SHEET

1. Title and Location of Project: Modifications for Energy Management, Various Locations 2. Project No IHE-500

8. Project Description, Justification and Scope (Cont.):

Approximately 10 of the most economical projects that will not be easily accomplished under private sector financing will be initiated, and some project scopes funded prior to FY 1994, will be extended. Extending the work scope to prior year projects will allow for a more flexible and faster approach to energy efficiency retrofit projects and will yeild increased energy savings. The projects will range from less than $5,000 to $5,000,000. The projects are for HVAC modifications, insulation of buildings, waste heat recovery, installation of more efficient lighting, steam line modifications, power factor improvements, etc. Some of these projects will generate rebate funds through utility company energy incentive programs. The quick payback projects selected for this line item will have the following total life-cycle cost effect utilizing a present value analysis:

Average Savings to Investment Ratio (SIR)	3.5
Average Payback Period	3.5 years
Total Annual Energy Savings	25 billion Btus
Annual Dollar Savings	$503,000

9. Details of Cost Estimate:

There are approximately 10 projects each with total estimated cost (TEC) less than $5,000,000 which will be initiated or extended by this project. The projects will be selected on the basis of economic return.

10. Method of Performance:

Design and inspection will be performed under negotiated architect-engineer contracts. Construction and procurement will be accomplished by fixed-price contracts awarded on the basis of competitive bidding.

11. Funding Schedule of Project Funding and Other Related Requirements:

Not required.

CONSTRUCTION PROJECT DATA SHEET

1. Title and Location of Project: Modifications for Energy Management, Various Locations 2. Project No. IHE-500

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements:

Not required.

13. Incorporation of Fallout Shelters:

Not applicable because these are small energy conservation retrofits of existing facilities.

14. Federal Compliance with Prevention Control Standards:

The total cost of these retrofits include the costs of those measures necessary to assure compliance with Executive Order 12088 where appropriate.

15. Evaluation of Flood Hazards:

Not applicable to small energy conservation retrofits.

16. Environmental Impact:

These small retrofits reduce energy consumption and thus reduce the Department's environmental impact.

17. Accessibility for the Handicapped:

Accessibility for the handicapped in accordance with the Architectural Barriers Act, PL 90-480 and 41 CFR 101.9 will be provided in these energy conservation retrofits where applicable.

PROPOSED APPROPRIATION LANGUAGE

For expenses of the Department of Energy activities including the purchase, construction and acquisition of plant and capital equipment and other expenses incidental thereto necessary for general science and research activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101, et seq.), including the acquisition or condemnation of any real property or facility or for plant or facility acquisition, construction, or expansion[; purchase of passenger motor vehicles (not to exceed 12 for replacement purposes only)], [$981,000,000], $1,009,000,000 to remain available until expended. (Energy and Water Development Appropriations Act, 1996.)

HIGH ENERGY PHYSICS

PROGRAM MISSION

The High Energy Physics (HEP) Program, a major component of the Department's fundamental research mission, is directed at understanding the nature of matter and energy at the most fundamental level, and the basic forces which govern all processes in nature. Fundamental research provides the necessary underpinning that enables the Nation to maintain its science and technology capabilities, to advance its industrial competitiveness, and to discover new and innovative approaches to our energy future.

The GOAL of the HEP Program is to:

Provide new insights into the nature of energy and matter so as to better understand the natural world.

The OBJECTIVES related to this goal are:

1. TO CONTINUE TO SUPPORT HIGH QUALITY RESEARCH - Support high quality university and laboratory based high energy physics research, both theoretical and experimental. Experimental research in HEP is primarily performed by university scientists using particle accelerators located at major laboratories in the U.S. and abroad.

2. TO EFFECTIVELY OPERATE THE DEPARTMENT'S HIGH ENERGY PHYSICS ACCELERATOR FACILITIES - Provide optimal and cost effective operation of the Fermi National Accelerator Laboratory, the Stanford Linear Accelerator Center, and the Alternating Gradient Synchrotron complex at the Brookhaven National Laboratory.

3. TO CONTINUE TO PROVIDE WORLD CLASS RESEARCH FACILITIES - Plan for and build new, state-of-the-art research facilities that allow researchers to advance the forefront of the science. Support essential improvements and upgrades at the major accelerator laboratories. Champion the construction of the Fermilab Main Injector project and the B-factory project at SLAC.

4. TO CONTINUE TO PROVIDE THE PROGRAM'S TECHNOLOGICAL BASE - Support long-range accelerator and detector R&D in order to develop the advanced concepts and technologies which are critical to the long-range viability of high energy physics research.

PROGRAM MISSION - HIGH ENERGY PHYSICS (Cont'd)

5. TO CONTINUE TO PURSUE INTERNATIONAL COLLABORATION ON LARGE SCIENCE PROJECTS - Continue to champion U.S. participation in the Large Hadron Collider (LHC) program at CERN. Recommend and defend funding for U.S. participation on the LHC project as recommended by the High Energy Physics Advisory Panel's "Future Vision" Subpanel. Continue negotiations with CERN leading to a formal agreement on U.S. participation in the LHC accelerator and major detector projects.

The 1994 HEPAP "Subpanel on the Vision for the Future of High Energy Physics" (Drell Subpanel) provided guidance on the future course of the HEP program. The above objectives strongly reflect that guidance.

PERFORMANCE MEASURES:

Performance measures related to basic science activities are primarily qualitative rather than quantitative. The scientific excellence of the HEP program is continually reevaluated through the peer review process. Some specific performance measures are:

1. Quality of scientific results and plans as indicated by expert advisory committees, peer reviews of the research, sustained progress, recognition by the scientific community, and awards received by DOE-supported HEP researchers.

2. Sustained achievement in advancing knowledge, as indicated by the publication of research results in refereed scientific journals, and by invited participation at national and international conferences and workshops.

3. Operation of research facilities in a manner that meets user requirements as indicated by achieving performance specifications while protecting the safety of the workers and the environment; meeting schedule and cost milestones; operating facilities that are used for research at the forefront of science; operating facilities reliably and according to planned schedules; maintaining and improving facilities at reasonable costs; and obtaining strong and enthusiastic endorsement by user organizations.

4. Accomplishment of all Fermilab Main Injector project and SLAC B-factory project cost and schedule milestones.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

1. Discovery at Fermilab of the top quark, the last of the fundamental building blocks of matter (quarks) predicted by the Standard Model of elementary particles.

2. The Tevatron accelerator at Fermilab continued to set world records for particle beam intensity (luminosity) by achieving a luminosity of 2.3×10^{31} $cm^{-2}sec^{-1}$, greatly exceeding its original 1981 design luminosity of 0.2×10^{31}.

3. The world's most precise measurement of the mass of the W boson at Fermilab.

4. The world's most precise measurement was made at SLAC of the weak mixing angle; a fundamental parameter of the Standard Model.

5. The Fermilab Main Injector Project is proceeding well and is within the planned cost and schedule profiles. All relevant milestones have been met. At the end of FY 1997 the project will be about 80% complete.

6. The B-factory Project at SLAC is proceeding well and is within the planned cost and schedule profiles. All relevant milestones have been met. At the end of FY 1997 the project will be about 90% complete.

7. The Director of the Office of Energy Research, and other U.S. representatives met with the Director-General of CERN in January 1996 to begin negotiations for the U.S. to join the CERN Large Hadron Collider project. A second negotiation meeting occurred in February. The negotiations are going well and a satisfactory agreement is expected by the end of 1996. Over 500 U.S. scientists have already shown their enthusiasm for participation in the LHC by joining the U.S.-ATLAS detector collaboration, the U.S.-CMS detector collaboration, or the U.S.-LHC accelerator consortium.

8. Participation in the LHC project at CERN will primarily take the form of U.S. accepting responsibility for providing particular subsystems of the accelerator and of the two large detectors. Thus much of the funding will go to U.S. groups for fabrication of components which will become part of the project. Funding is being provided in FY 1996 for preliminary design and engineering work needed to identify and clarify what subsystems should be considered for inclusion in the agreement with CERN. This funding is important in order to provide the cost and technical bases for the proposed U.S. responsibilities in LHC, and to be ready for rapid start to satisfy the anticipated timetable for the project. Funding in the amount of $15,000,000 is being requested for FY 1997 to support the initiation of those activities provided for in the anticipated agreement with CERN.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS (Cont'd):

9. The High Energy Physics request includes $403,975,000 to maintain support of the Department's scientific user facilities. Approximately 4% of this amount is associated with the continuation of the science user facilities initiative contained in the FY 1996 budget request. This investment will provide significant research time for thousands of scientists in universities, Federal agencies, and U.S. companies. It will also leverage both Federally and privately sponsored research, consistent with the Administration's strategy for enhancing the U.S. National science investment. This level supports users at FY 1996 levels. The proposed funding will support operations at all three of the Department's major high energy physics facilities: the Tevatron, the Stanford Linear Collider, and the Alternating Gradient Synchrotron. The proposed funding is consistent with the recommendations of the High Energy Physics Advisory panel expert subpanel that advised the Department on the appropriate future path for the Department's High Energy Physics program in the wake of the cancellation of the Superconducting Super Collider in 1993.

PHYSICS RESEARCH
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

This activity provides support for university and laboratory based research groups conducting experimental and theoretical research in high energy physics. This research probes the nature of matter and energy at the most fundamental level, and the characteristics of the basic forces in nature. Experimental research activities include: planning, design, fabrication and installation of experiments; conduct of experiments; analysis and interpretation of data; and publication of results. Theoretical physics research provides the framework for interpreting and understanding observed phenomena and, through predictions and extrapolations based on current understanding, identifies key questions for future experimental explorations. This subprogram supports more than 100 research groups at major universities as well as research groups at 9 DOE laboratories.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Fermilab National Accelerator Laboratory	$ 10,469	$ 10,158	$ 9,978	$ -180	-1.8%

Total, Physics Research	$139,139	$141,000	$141,290	$+ 290	+0.2%

III. Performance Summary:

FY 1995 Accomplishments:

- The conduct of experiments and the ongoing analysis of data collected in FY 1995 and previous years from the Tevatron Collider at Fermilab utilizing its CDF and D-Zero detector facilities.

III. Performance Summary: PHYSICS RESEARCH

- Discovery of the top quark by the CDF and D-Zero detector collaborations in experiments performed at Fermilab, and preliminary measurement of its mass.

- Conduct of experiments and the ongoing analysis of data collected in FY 1995 and previous years utilizing the SLD detector with the SLC collider at SLAC, and using the fixed target facilities in End Station A.

- The world's most precise measurement, at SLAC, of the weak mixing angle; a fundamental parameter of the Standard Model.

- Recorded extensive data using the kaon beams at the AGS at BNL in experiments searching for exceedingly rare decays of the kaon. These experiments are providing a stringent test of the presently accepted Standard Model of elementary particles.

- Participation in advanced R&D and design work related to the CMS and ATLAS detector facilities to be fabricated for future research at the LHC accelerator project at CERN.

- Conduct of experiments and the ongoing analysis of data collected earlier using four major detector facilities at the LEP collider at CERN.

- Major collaborator in a large international detector facility (ZEUS) at the DESY laboratory in Hamburg, Germany, recording collisions of high-energy positrons with high-energy protons in order to map the internal structure of the proton with unprecedented sensitivity.

- The world's most precise measurement of the mass of the W boson using the CDF detector at Fermilab. This measurement, combined with the measurement of the top quark mass, yields a rough prediction of the Higgs mass.

- Formulation of the research program and detailed design of the BaBar detector for the B-factory at SLAC.

- Major breakthrough at Rutgers and Princeton in the discovery of a solvable realistic quantum field theory.

- The discovery of several distant supernovas using particle-astrophysics techniques.

- Data collection using a highly instrumented 1000 ton detector deep underground in the Soudan mine in Minnesota, searching for the spontaneous decay of a nucleon and measuring the fluxes of background cosmic ray muons and neutrinos.

- Funding in the amount of $329,000 and $475,000 has been transferred to the SBIR and STTR programs, respectively.

III. Performance Summary: PHYSICS RESEARCH (Cont'd)

FY 1996 Accomplishments (to date and planned):

- o Completion of fabrication and initial operation of ten major new fixed target experiments at Fermilab.
- o Completion of a year-long period of data collection using the CDF and D-Zero detectors facilities at Fermilab, including significant upgrades of certain detector subsystems.
- o Analysis of data collected at CDF and D-Zero during the FY 1995 operation of the Tevatron accelerator facility.
- o Collect data using the SLD detector at the SLC at SLAC using the new vertex detector. Obtain important new understanding of B mesons.
- o Continue analysis of data recorded by experiments at the AGS at BNL which are searching for rare kaon decays.
- o Continue operation of 5 fixed target experiments at the AGS at BNL.
- o Commission the beam line which will deliver beams to an experiment intended to measure very precisely the magnetic properties of the muon. This is at the AGS at BNL.
- o Participation in design, engineering and R&D on CMS and ATLAS detectors for the LHC at CERN.
- o Conduct experiments and analysis of data collected using four major detectors at the LEP collider at CERN.
- o Continue work on the design and fabrication of the BaBar detector for use at the SLAC B-factory facility to be completed in FY 1998.
- o Further development of theoretical approaches to understanding and interpreting the most recent experimental results.
- o Continue operation of the Soudan underground detector searching for proton decay.
- o Complete fabrication and start initial operation of the Super-Kamiokande detector in Japan.

1246

III. Performance Summary: PHYSICS RESEARCH (Cont'd)

- Continue collaboration in the ZEUS positron-proton detector facility at DESY.

FY 1997 Planned Accomplishments:

- Completion of a two year long period of data collection for ten major fixed target experiments at Fermilab, which were installed and brought into operation in FY 1996.
- Analysis of the data collected during FY 1996 with the collider detectors and the fixed target experiments at Fermilab.
- Initial operation at the AGS at BNL of an experiment intended to measure very precisely the magnetic properties of the muon.
- Continue analysis of data recorded by the experiments at the AGS at BNL searching for rare kaon decays.
- Continue operation of 5 fixed target experiments at the AGS at BNL.
- Participate in design, engineering, and R&D on both the CMS and the ATLAS detector facilities for the LHC at CERN.
- Conduct experiments and analyze data collected earlier using four major detectors at the LEP collider at CERN.
- Continue work on the design and fabrication of the BaBar detector for use at the B-factory at SLAC.
- Major data collection using the Super-Kamiokande underground detector in Japan.
- Continue operation of the Soudan underground detector searching for proton decay.
- Continue collaboration in the ZEUS positron-proton experiment in Hamburg.

III. Performance Summary: PHYSICS RESEARCH (Cont'd)

Explanation of funding changes FY 1996 to FY 1997:

The decrease of $180,000 at Fermilab results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The decrease of $210,000 at SLAC results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The decrease of $160,000 at BNL results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The decrease of $200,000 at LBNL results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The decrease of $110,000 at ANL results from the programmatic shifts to provide funding for the involvement in the LHC and results from programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The increase of $1,150,000 in the University and Other Laboratories activity reflects continued strong support for the university based component of the HEP program.

HIGH ENERGY PHYSICS

FACILITY OPERATIONS
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

This activity provides for the operation of the large accelerator and detector facilities which are the essential tools that enable scientists in university and laboratory based research groups to perform experimental research in high energy physics. This subprogram includes funding for the operation and maintenance of the national laboratory research facilities including accelerators, colliders, secondary beam lines, detector facilities for experiments, experimental areas, computing, and computing networking facilities. It includes the costs of personnel, electric power, expendable supplies, replacement parts and subsystems, and inventories. The ultimate measure for success in this activity is whether the research scientists have data of sufficient quantity and quality to do their planned measurements or to discover new phenomena. The quality of the data is dependent on the accelerator and detector capabilities and on the degree to which those capabilities are achieved during a particular operating period. The quantity of the data relates primarily to the beam intensity, the length of the operating period, and the operational availability of the accelerator and detector facilities.

The principal objective of the Facility Operations Subprogram is to maximize the quantity and quality of data collected for approved experiments being conducted at the HEP facilities.

1249

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Fermilab National Accelerator Laboratory	$143,542	$143,095	$142,815	$- 280	- 0.2%
Stanford Linear Accelerator Center	79,400	73,045	72,905	- 140	- 0.2%
Brookhaven National Laboratory	44,755	43,625	43,535	- 90	- 0.2%
Universities and Other Laboratories	278	6,807	11,955	+5,148	+75.6%
Total, Facility Operations	$267,975	$266,572	$271,210	$+4,638	+ 1.7%

III. Performance Summary: FACILITY OPERATIONS

FY 1995 Accomplishments:

- Operation of the Tevatron colliding beams facility at Fermilab for an extended period and with strong utilization of its CDF and D-Zero detector facilities. There were 40 weeks of operation with 70% availability, and 130 luminosity units of beam were delivered.
- Completion and installation of nine major new fixed target experiments at Fermilab in preparation for the planned 1996 fixed target run.
- Operation of the SLC Collider at SLAC utilizing the SLD detector facility for 25 weeks.
- Operation of the SLAC accelerator for 2 weeks for End Station A (fixed target) experiments.
- Operation of the SLAC accelerator for about 4 weeks for R&D studies relating to a future large linear collider.
- Operation of AGS at BNL for 5 major HEP experiments for 25 weeks.
- Preparation for fixed target operations at SLAC in FY 1996, including the upgrade of the polarized target for the experiments.
- Funding in the amount of $8,588,000 has been transferred to the SBIR program.

1250

FY 1996 Accomplishments (to date and planned):

- Operation of the Tevatron Collider at Fermilab for utilization of the CDF and D-Zero detector facilities during the first four months of FY 1996. This will provide 15 weeks of operation.
- Transition from collider operation to fixed target operation of the Tevatron at Fermilab by the end of the third quarter of FY 1996.
- Operation for research of the Tevatron fixed target facilities at Fermilab for 12 weeks.
- Operation of the SLC Collider at SLAC utilizing the SLD detector facility for 25 weeks.
- Operation of fixed target facilities at SLAC for End Station A for 10 weeks.

III. Performance Summary: FACILITY OPERATIONS (Cont'd)

- o Operation of the SLAC accelerator for about 4 weeks for R&D studies relating to a future large linear collider.
- o Operation of the AGS at BNL for 5 major HEP experiments for 14 weeks providing the world's highest intensity Kaon beams for experiments probing the boundaries of known physics.
- o Operation of the AGS at BNL for 2 weeks for the initial engineering shakedown of the experiment intended to measure very precisely the magnetic properties of the muon.
- o Funding in the amount of $4,598,000 has been budgeted for the SBIR program.

FY 1997 Planned Accomplishments:

- o Operation of the fixed target capabilities of the Tevatron at Fermilab for about 29 weeks.
- o Operation of the SLC Collider at SLAC utilizing the SLD detector facility for 26 weeks.
- o Operation of fixed target facilities at SLAC for End Station A for 6 weeks.
- o Operation of the SLAC accelerator for about 4 weeks for R&D studies relating to the a future large linear collider.
- o Operation of the AGS at BNL for 5 major HEP experiments for 15 weeks providing the world's highest intensity Kaon beams for experiments probing the boundaries of known physics and for the experiment to measure the magnetic properties of the muon.
- o Funding in the amount of $7,954,000 has been budgeted for the SBIR program.

Explanation of funding changes FY 1996 to FY 1997:

The decrease of $280,000 at Fermilab results from programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The decrease of $140,000 at SLAC results from programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

III. Performance Summary: FACILITY OPERATIONS (Cont'd)

The decrease of $90,000 at BNL results from programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The increase of $5,148,000 in Universities and Other Labs reflects an increase of $3,356,000 in the SBIR allocation and an increase of $1,792,000 in other programmatic activities.

HIGH ENERGY TECHNOLOGY
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

This subprogram provides the specialized advanced technology R&D required to sustain and extend the technology base and provide operational support for the highly specialized accelerators, colliding beams facilities, and detector facilities which are essential to the overall high energy physics program goal of carrying out forefront research. The objectives of this subprogram include: 1) carry out R&D in support of existing accelerator and detector facilities aimed at maintaining and improving their performance parameters and cost effectiveness; 2) carry out R&D in support of planned and proposed projects to maximize their performance goals and cost effectiveness; 3) carry out R&D to transfer new concepts and technologies into practical application in the HEP context; and 4) carry out R&D to search for and develop new concepts and ideas which could lead to significant enhancements of research capabilities or to significant cost savings in the construction and operation of new facilities. This subprogram supports work primarily at the DOE labs, but also at universities, other federal labs, and in industry.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Fermilab National Accelerator Laboratory	$14,394	$13,785	$13,515	$- 270	- 2.0%
Stanford Linear Accelerator Center	13,367	15,480	15,170	- 310	- 2.0%
Brookhaven National Laboratory	6,329	6,415	6,285	- 130	- 2.0%
Lawrence Berkeley National Laboratory	9,585	9,313	9,133	- 180	- 1.9%
Universities and Other Labs	13,938	23,930	30,777	+ 6,847	+28.6%
Total, High Energy Technology	$57,613	$68,923	$74,880	$+ 5,957	+ 8.6%

III. Performance Summary:

FY 1995 Accomplishments:

- Produced beams of ultra short electron bunches in the Argonne Wakefield Accelerator with 100 nanoCoulombs in each bunch. This exceeds, by a factor of about 10, the previous world's record.

III. Performance Summary: HIGH ENERGY TECHNOLOGY (Cont'd)

- Completed preparations for new experiments on the LBNL Advanced Light Source test beam line.
- Developed, at LBNL, radiation-hard, high-speed silicon readout chips for use at Fermilab.
- Carried out R&D in support of upgrading the two Tevatron collider detectors to exploit the increased data rates that the Fermilab Main Injector will provide beginning in FY 1999.
- Tested, at BNL, superconducting wire and cable produced for use in several projects. This included critical current measurements, and stability tests on special cable prepared at CERN.
- The BNL Accelerator Test Facility (ATF) set a world record brightness for electron accelerators of 60 amperes per square millimeter. Using a CO_2 laser synchronized to the beam pulses of an electron linear accelerator, the ATF achieved a laser acceleration record of 3.7 million electron volts over 12 centimeters.
- Continued R&D on the feasibility of a high energy linear collider including work on beam optics, high gradient accelerating structures, and the RF system.
- Continued development of advanced detector technology for the B-factory detector.
- Upgraded the optics in End Station A at SLAC to handle a linac energy of 55 GeV for the experimental program.
- Upgraded the SLC to produce a performance level of 100,000 Z° particles per year at an average electron polarization of 80%.
- Demonstrated improved capability for accelerating polarized protons in the AGS at BNL.
- Performed R&D in support of the B-factory Project. This was done at SLAC, LBNL and LLNL.
- Funding in the amount of $577,000 has been transferred to the SBIR program.

III. Performance Summary: HIGH ENERGY TECHNOLOGY (Cont'd)

FY 1996 Accomplishments (to date and planned):

- o Develop, at the Argonne Wakefield Accelerator, a laser beam with a hemispherical wavefront to produce higher intensity electron bunches.
- o Develop and test, at LBNL, new superconducting wire coatings and materials to improve accelerator magnet performance.
- o Complete testing at LBNL of a magnet built using brittle superconductors capable of producing a much higher magnetic field than is available in accelerator magnets in present use.
- o Complete tests of plasma lens at LBNL, perform studies of the interactions of laser beams and electron beams, and initiate laser acceleration studies at the Advanced Light Source test beam line.
- o Perform, at LBNL, R&D on damping rings for a future linear collider.
- o Test the increased data-rate capability of the two upgraded Tevatron collider detectors using the proton beam extracted from the Tevatron. The D-Zero upgrade to silicon tracking is completed.
- o Develop the capability to test, at BNL, superconducting cable in superfluid helium.
- o Funding in the amount of $4,800,000 is being used for planning and design activities in the U.S. in preparation for the proposed U.S. involvement in the LHC project at CERN.
- o Continued R&D at BNL on RF guns and laser acceleration in the range of 40 to 100 MeV.
- o Complete studies designed to upgrade the SLC to a performance level of 250,000 Z°s per year with greater than 80% polarization of the electron beam.
- o Continue R&D at SLAC on the feasibility of a high energy linear collider including high gradient structures, RF System and beam optics.
- o Complete and bring into initial operation the Next Linear Collider Test Facility (NLCTF) at SLAC.
- o Funding in the amount of $4,932,000 and $715,000 has been budgeted for the SBIR and STTR programs, respectively.

III. Performance Summary: HIGH ENERGY TECHNOLOGY (Cont'd)

FY 1997 Planned Accomplishments:

- Perform the first ever experiments studying wakefield acceleration in dielectric loaded waveguide.
- Apply new LBNL superconducting cables to specific high energy physics magnet upgrades, and fabricate a new higher-field magnet specifically based on improved high-field cable.
- Perform laser acceleration tests on the LBNL Advanced Light Source test beam line; begin tests on relativistic klystron two-beam accelerating hardware.
- Continue collaborative studies at LBNL and SLAC on B-Factory and large linear collider.
- Completion and testing of a new tracking subsystem for the CDF at Fermilab with improved radiation resistance.
- Production testing of LHC superconducting cable at BNL under the US/CERN program for participation in the new collider.
- Funding in the amount of $12,000,000 is requested for U.S. based efforts on the LHC project in accord with the U.S.-CERN agreement on participation in the LHC which is expected to be concluded in 1996.
- Complete and bring into operation a new barrier cavity for use in the AGS at BNL during beam injection and stacking. This will allow new record proton beam intensities, making new generation high precision experiments possible.
- Bring into operation a laser grating accelerator at the ATF at BNL.
- Continue upgrades to the Tevatron Collider accelerator at Fermilab and to the CDF and D-Zero detector facilities in preparation for operation with the higher beam intensities available from the new Fermilab Main Injector beginning in FY 1999.
- Completion of initial feasibility studies for a large linear collider.
- Commissioning of the NLCTF and initial tests on high gradient accelerating structure performance and RF power systems.
- Funding in the amount of $4,231,000 has been budgeted for the SBIR program.

1256

III. Performance Summary: HIGH ENERGY TECHNOLOGY (Cont'd)

Explanation of funding changes FY 1996 to FY 1997:

The decrease of $270,000 at Fermilab results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The decrease of $310,000 at SLAC results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The decrease of $130,000 at BNL results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The decrease of $180,000 at LBNL results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

The net increase of $6,847,000 in the University and Other Laboratory activity is the result of a $7,200,000 increase in funding for R&D related to the LHC project together with a $348,000 increase in other program activities and a $701,000 decrease in the allocation for the SBIR programs.

1257

RELATED CAPITAL FUNDING
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

This activity provides for improvements and modifications to existing accelerator and detector facilities that are necessary to explore the fundamental nature of matter. Major accelerator and detector construction projects are included in the construction section. The subprogram includes Accelerator Improvement Projects, which are small projects designed to improve existing accelerator and detector facilities; and Capital Equipment, which provides for new equipment and facilities or the enhancement or extension of existing facilities when Plant changes are not required. In addition, the subprogram includes General Plant Projects and General Purpose Equipment which provide for general purpose facilities not directly a part of the scientific program of a laboratory but essential for maintaining the infrastructure of a site and for addressing ES&H needs.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$57,700	$65,120	$70,780	$+5,660	+8.7%
General Plant Projects	12,146	12,275	12,025	- 250	-2.0%
Accelerator Improvement Projects	10,590	9,110	8,940	- 170	-1.9%
Total, Related Capital Funding	$80,436	$86,505	$91,745	$+5,240	+6.1%

III. Performance Summary:

FY 1995 Accomplishments:

- Established formal collaboration among the parties who will build BaBar, the B-factory detector. This collaboration involves SLAC and a number of other US and foreign universities and laboratories. Initiated detailed engineering design of the detector The B-factory detector at SLAC has been identified as a Major Item of Equipment, and was funded at $7,500,000, with a Tr Estimated Cost of $67,000,000.

III. Performance Summary: RELATED CAPITAL FUNDING

- The Super-Kamiokande experiment in Japan has been identified as a Major Item of Equipment, and was funded at $880,000, with a Total Estimated Cost of $3,584,000.

- The g-2 experiment at BNL has been identified as a Major Item of Equipment, and was funded at $2,923,000, with a Total Estimated Cost of $16,893,000.

- Rare K decay experiment at BNL has been identified as a Major Item of Equipment, and was funded at $400,000, with a Total Estimated Cost of $9,864,000.

- The D-Zero Upgrade at Fermilab has been identified as a Major Item of Equipment, and was funded at $4,447,000, with a Total Estimated Cost of $55,270,000.

- The CDF Upgrade at Fermilab has been identified as a Major Item of Equipment, and was funded at $4,447,000, with a Total Estimated Cost of $57,940,000.

- KTeV at Fermilab has been identified as a Major Item of Equipment, and was funded at $3,461,000, with a Total Estimated Cost of $18,125,000.

- The Next Linear Collider Test Facility at SLAC has been identified as a Major Item of Equipment, and was funded at $1,700,000, with a Total Estimated Cost of $13,100,000.

- GPP funding was provided for minor new construction, other capital alterations and addition, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project did not exceed $2,000,000.

- AIP funding supported additions and modifications to accelerator facilities which are supported by the HEP research program.

III.Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

FY 1996 Accomplishments (to date and planned):

- Acquisition and fabrication of equipment in support of the R&D program related to the proposed U.S. involvement in the LHC project at CERN. The fund being provided is $1,200,000.
- Procurement of major components of the BaBar detector for the B-factory at SLAC. The B-factory detector at SLAC has been identified as a Major Item of Equipment, and was funded at $14,000,000, with a Total Estimated Cost of $67,000,000.
- The Antimatter Spectrometer in Space experiment has been identified as a Major Item of Equipment, and will be funded at $2,125,000, with a Total Estimated Cost of $2,625,000.
- The Super-Kamiokande experiment in Japan has been identified as a Major Item of Equipment, and will be funded at $1,080,000, with a Total Estimated Cost of $3,584,000.
- The g-2 experiment at BNL has been identified as a Major Item of Equipment, and will be funded at $2,500,000, with a Total Estimated Cost of $16,893,000.
- Rare K decay experiment at BNL has been identified as a Major Item of Equipment, and will be funded at $1,000,000, with a Total Estimated Cost of $9,864,000.
- The D-Zero Upgrade at Fermilab has been identified as a Major Item of Equipment, and will be funded at $7,625,000, with a Total Estimated Cost of $55,270,000.
- The CDF Upgrade at Fermilab has been identified as a Major Item of Equipment, and will be funded at $7,625,000, with a Total Estimated Cost of $57,940,000.
- KTeV at Fermilab has been identified as a Major Item of Equipment, and will be funded at $1,525,000, with a Total Estimated Cost of $18,125,000.
- The Next Linear Collider Test Facility at SLAC has been identified as a Major Item of Equipment, and will be funded at $1,700,000, with a Total Estimated Cost of $13,100,000.

1260

III.Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

- GPP funding will be provided for minor new construction, other capital alterations and addition, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

- AIP funding supported additions and modifications to accelerator facilities which are supported by the HEP research program. The total estimated cost of each project will not exceed $2,000,000.

FY 1997 Planned Accomplishments:

- Funding in the amount of $3,000,000 is being requested for acquisition and fabrication of equipment in support of the R&D program related to the U.S. involvement in the LHC project at CERN in accord with the U.S.-CERN agreement on participation in LHC which is expected to be concluded in 1996.

- Completion of the subsystems of the BaBar detector and initiation of assembly in the detector hall in anticipation of first research with the B-factory in FY 1999. The B-factory detector at SLAC has been identified as a Major Item of Equipment, and will be funded at $20,500,000, with a Total Estimated Cost of $67,000,000.

- Delivery and testing of the large solenoidal magnet for the D-Zero detector facility upgrade at Fermilab.

- The Antimatter Spectrometer in Space experiment has been identified as a Major Item of Equipment, and will be funded at $500,000, with a Total Estimated Cost of $2,625,000.

- The Super-Kamiokande experiment in Japan has been identified as a Major Item of Equipment, and will be funded at $593,000, with a Total Estimated Cost of $3,584,000.

- Rare K decay experiment at BNL has been identified as a Major Item of Equipment, and will be funded at $1,000,000, with a Total Estimated Cost of $9,864,000.

III. Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

- The D-Zero Upgrade at Fermilab has been identified as a Major Item of Equipment, and will be funded at $10,000,000, with a Total Estimated Cost of $55,270,000.

- The CDF Upgrade at Fermilab has been identified as a Major Item of Equipment, and will be funded at $10,000,000, with a Total Estimated Cost of $57,940,000.

- GPP funding will be provided for minor new construction, other capital alterations and addition, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

- AIP funding supported additions and modifications to accelerator facilities which are supported by the HEP research program. The total estimated cost of each project will not exceed $2,000,000.

1262

Explanation of funding changes FY 1996 to FY 1997:

- The decrease of $250,000 in GPP results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

- The decrease of $170,000 in AIP results from the programmatic shifts to provide funding for the involvement in the LHC and for the three major detector fabrication programs.

- The funding for Other Capital Equipment at BNL is unchanged.

- The increase of $5,660,000 in programmatic Capital Equipment reflects an increase of $1,800,000 for R&D efforts related to the proposed U.S. involvement in the LHC project, an increase of $4,170,000 in the funding for SLAC with strong emphasis on the B-factory detector, an increase of $4,500,000 in the funding for Fermilab with strong emphasis on the CDF and D-Zero upgrade projects at Fermilab offset by a decrease of $4,810,000 in other program activities.

CONSTRUCTION
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Construction	$87,000	$104,000	$100,000	$-4,000	-3.9%
Total, Construction	$87,000	$104,000	$100,000	$-4,000	-3.9%

III. Performance Summary:

FERMILAB MAIN INJECTOR

FY 1995 Accomplishments:

- Completion of construction of 3/4 of ring tunnel and fabrication and testing 1/4 of the main dipole magnets for the Fermilab Main Injector Project.
- At the end of FY 1995, the Fermilab Main Injector Project was 36% complete.

FY 1996 Accomplishments (to date and planned):

- Completion of construction of all of the ring tunnel and service buildings, and fabrication and testing of 70% of the main dipole magnets for the Fermilab Main Injector Project.
- At the end of FY 1996, the Fermilab Main Injector Project will be 62% complete.

III. Performance Summary: CONSTRUCTION (Cont'd)

FY 1997 Planned Accomplishments:

- o Completion of 95% of the main dipole magnets, all of the magnet power supplies, and the local electric power substation for the Fermilab Main Injector Project.
- o At the end of FY 1997, the Fermilab Main Injector Project will be 80% complete.

SLAC B-FACTORY

FY 1995 Accomplishments:

- o Completion of tunnel clearing; initiation of refurbishment of magnets for the high energy ring; and initiation of fabrication of magnets for the low energy ring; for the B-factory Project at SLAC.
- o At the end of FY 1995, the SLAC B-factory Project was 36% complete.

FY 1996 Accomplishments (to date and planned):

- o Completion of fabrication and installation of all of the magnets and vacuum chambers for the high energy ring; successful testing of the electron transfer lines; completion and initial testing of the control system; and completion of the positron extraction system for the B-factory Project at SLAC.
- o At the end of FY 1996, the SLAC B-factory Project will be 70% complete.

1264

III. Performance Summary: CONSTRUCTION (Cont'd)

FY 1997 Planned Accomplishments:

- Completion of the technical components of the B-factory and initiation of testing with beam in anticipation of project completion in FY 1998.
- At the end of FY 1997, the SLAC B-factory Project will be 90% complete.

SLAC MASTER SUBSTATION UPGRADE

FY 1995 Accomplishments:

- N/A (project begins in FY 1997)

FY 1996 Accomplishments (to date and planned):

- N/A (project begins in FY 1997)

FY 1997 Planned Accomplishments:

- Initiation of an infrastructure improvement project at SLAC to upgrade and reconfigure the master substation which supplies power to the entire SLAC site. This will replace obsolete and hard to maintain switchgear; improve worker safety; and extend the useful life of the two primary transformers.
- At the end of FY 1997, the SLAC Master Substation Upgrade Project will be 25% complete.

1265

III. Performance Summary: CONSTRUCTION (Cont'd)

Explanation of funding changes FY 1996 to FY 1997:

Level funding for the Fermilab Main Injector maintains the project on the approved funding profile.

The decrease of $7,000,000 in the SLAC B-factory maintains the project on the approved funding profile.

Funding of $3,000,000 is included for initiation of the SLAC Master Substation Upgrade.

HIGH ENERGY PHYSICS

1. Title and location of project: Master Substation Upgrade Stanford Linear Accelerator Center	2a. Project No. 97-G-303 2b. Construction Funded
3a. Date A-E Work Initiated: 1st Qtr. FY 1997 3b. A-E Work (Title I & Title II) Duration: 6 months	5. Previous Construction Estimate: None Total Estimated Cost (TEC) -- None Total Project Cost (TPC) -- None
4a. Date Physical Construction Starts: 3rd Qtr. FY 1997 4b. Date Construction Ends: 4th Qtr. FY 1998	6. Current Cost Estimate: TEC -- $12,400 TPC -- $12,430

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Obligations	Costs
1997	3,000	3,000	3,000
1998	9,400	9,400	9,400

8. Project Description, Justification and Scope

This project replaces obsolete equipment and reconfigures the master substation to optimize the reliability and operational flexibility of this primary site substation.

The present substation configuration requires the primary transformers to operate with a significantly unbalanced loading, reducing the life of one while underutilizing the other. The new configuration will allow the balancing of load between the two primary transformers, effectively lengthening their service life indefinitely.

1. Title and location of project: Master Substation Upgrade
Stanford Linear Accelerator Center

2a. Project No. 97-G-303
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

Existing switchgear was built by several different manufacturers, some of which have been out of business for more than 15 years. The switchgear is 30 years old and approaching the end of its useful life. Spare parts are not available and we must rely on overhauled or used parts to repair this equipment. New switchgear will be in compliance with current OSHA safety regulations, improving worker safety.

Present 230kV distribution to the two primary transformers consists of a combination of exposed overhead buss to one primary transformer and SF_6 insulated buss to the other primary transformer. The SF_6 buss requires continuous monitoring and frequent maintenance due to SF_6 leaks and overtemperature problems. Safety disconnects for the SF_6 buss cannot be visually verified in the open position due to the discoloration of their windows requiring the electricians to verify their status by making voltage measurements. This SF_6 buss and disconnects will be replaced by exposed overhead buss and open disconnects to match the other primary transformer configuration.

Obsolete 12.47kV switchgear will be replaced by new switchgear capacity to operate the two 230kV primary site transformers in parallel rather than separately, as presently done. The two primary site transformers will be relocated next to each other and provided with new overhead buss and open frame disconnect switches to eliminate the troublesome SF_6 buss and disconnect switches currently in use.

Backup power is provided through a separate 69kV source which is reduced by two transformers to 12.47kV that is out of phase with the 12.47kV from the two primary transformers. The phase difference prevents parallel operation of a primary and backup transformer. In order to utilize the backup source, the entire site load must be turned off and then restarted to prevent damage due to the out-of-phase incompatibility. This project will replace the two 69kV transformers by a single transformer that is in-phase with the primary 230kV transformers. In-phase backup power will allow transfers between primary and backup sources without the time lost in turning off and restarting all the connected loads.

Relocating one of the 230kV primary transformers and placing the new 69kV transformer in new locations will reduce the installation costs for the buss replacements and allow construction of new concrete secondary containment for these two transformers, which will bring them into compliance with environmental regulations for oil filled equipment.

The activities in the first year of this project will consist of initial procurements, detailed engineering, and installation of those portions of this project that do not require site power outages.

Procurement and installation of the remainder of the project will be completed in the second year.

1. Title and location of project: Master Substation Upgrade
Stanford Linear Accelerator Center

2a. Project No. 97-G-303
2b. Construction Funded

9. Details of Cost Estimate*

The following dollar distribution represents the new obligation authority necessary beginning in FY 1997 for the construction project described herein:

	Item Cost	Total Cost
a. Engineering Design and Inspection		$ 1,640
1. Engineering Design and Inspection at approximately 14% of Construction	$ 1,170	
2. Project Management at approximately 5% of Construction	470	
b. Construction Cost	9,330	
1. Equipment and Materials	6,820	
2. Removal and Installation	2,510	
c. Subtotal Engineering Design and Inspection, Construction and Project Management		10,970
d. Contingency at 13% of Item C		1,430
e. Total estimated project cost		$ 12,400

* All costs are escalated to the mid-point of construction. The rates used are 4.0, 3.9, and 3.8 percent for the years FY 1995, FY 1996, and FY 1997 respectively, as shown in the "DOE Department Price Change Index," dated January 1995.

A conceptual design report titled "Master Substation Upgrade" is completed for an estimated cost of $30,000.

10. Method of Performance

Engineering, design and inspection will be accomplished by SLAC Plant Engineering personnel. To the extent feasible, equipment and materials, removal and installation will be accomplished by fixed-price procurements or subcontracts awarded on the basis of competitive bidding.

2b. Construction Funded

3a. Date A-E Work Initiated: 1st Qtr. FY 1994

3b. A-E Work (Title I & Title II) Duration: 30 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $177,000
Total Project Cost (TPC) -- $293,200

4a. Date Physical Construction Starts: 1st Qtr. FY 1994

4b. Date Construction Ends: 4th Qtr. FY 1998

6. Current Cost Estimate:
TEC -- $177,000
TPC -- $293,200

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Obligations	Costs
1994	$ 36,000	$36,000	$13,385
1995	44,000	44,000	39,470
1996	52,000	52,000	60,000
1997	45,000	45,000	47,430
1998	0	0	16,715

8. Project Description, Justification and Scope

The project involves the modification of the SLAC linac and Positron-Electron Project (PEP) storage ring to provide for collisions of 9-GeV electrons with 3-GeV positrons at high luminosity. The existing PEP ring will be upgraded and used for the electrons. A new, separate, lower energy ring for the positrons will be provided in the PEP tunnel. The two rings will intersect in one of the existing PEP interaction

8. Project Description, Justification and Scope (Continued)

regions, where a particle detector will be installed. At the completion of the project it will be possible to accelerate electrons to 9 GeV and positrons to 3 GeV in the linac, inject them into the storage rings, bring them into collision at a luminosity in the range of 10^{33} $cm^{-2}s^{-1}$, and detect the products of the collisions.

Specifically provided for in the scope of the project are the following actions:

- The linac, which can accelerate both electrons and positrons to 50 GeV over its full length of 2 miles, will be modified to permit the extraction of 9-GeV electrons and 3-GeV positrons at the appropriate points.
- Two bypass lines, including appropriate magnetic optical elements, will be installed alongside the linac in the existing linac enclosure to permit the 9-GeV and 3-GeV extracted beams to be transported to the end of the linac.
- The PEP storage ring, which has a circumference of 2.2 km, will be refurbished.
  - The existing PEP storage ring magnet system will be removed from the tunnel, refurbished for storing electrons at 9 GeV with increased luminosity, and reinstalled in the tunnel.
  - A new, 3-GeV positron storage ring will be constructed and installed in the PEP tunnel along with the electron storage ring.
  - The beam lines that now connect the linac to the PEP ring will be modified to allow electron and positron beams of different energies to be transported from the ends of the new bypass lines to the storage rings.
  - The existing PEP cooling water system and electrical power distribution system will be modified for the B-Factory.
  - New microwave power and control systems will be constructed for the storage rings.

The project requires no conventional construction. The project will be housed in the existing Linac and PEP ring enclosures.

The primary purpose of this project is to provide a facility for observing colliding beams of electrons and positrons at a center-of-mass collision energy of 10 GeV to 11 GeV with sufficient luminosity, and with electrons and positrons having sufficiently different energies, to measure the extent to which charge/parity conservation is violated in the B meson system and thereby test the predictions of the Standard Model of particle physics in this important area. A second important purpose is to provide a facility for pursuing a broad program of experimental studies of bottom quark, charm quark, tau lepton, and two-photon physics with large numbers of events and thus high

1274

8. Project Description, Justification and Scope (Continued)

precision. This broad-based program of experiments will directly confront a number of crucial questions about the Standard Model and, consequently, will provide possibly the best window to new physics understanding of any currently proposed facility.

Violation of charge/parity conservation, or CP violation, is a fundamental, symmetry-breaking process that is believed to be responsible for our very existence - without it the equal amounts of matter and antimatter that it is thought were formed at the origin of the universe might by now have come together and been annihilated. The Standard Model, which is the embodiment of our most basic understanding of particle physics, predicts that CP violation is manifested in significantly different decay rates for neutral B mesons and antimesons. Yet, because no existing accelerator can produce enough pairs of B mesons and antimesons to observe the effect, this important prediction has never been confronted with experimental data.

In the B-Factory, the collision energy and luminosity are optimized for copious production of B meson pairs, and the energy asymmetry of the electron and positron beams is chosen to optimize the detection of different decay rates for B mesons and antimesons. Execution of this project will permit the very important first experimental test of the Standard Model's explanation of CP violation.

While the primary goal of this project is to study CP violation experimentally as a means of testing the validity of the Standard Model, the B-Factory will also provide an opportunity to pursue a rich program of experiments in a large number of other areas of intense interest in high energy physics. For example, studies of rare decay modes of B mesons will be possible with unprecedented sensitivity, as will measurements of transitions in the bound $b\bar{b}$ (quark-antiquark) system. Charmed mesons and baryons will be produced in abundance, and their decays can be studied in great detail. Copious production of tau/anti-tau pairs will permit a wealth of new and precise measurements of the tau system, including the tau lifetime and a substantial reduction in the upper limit on the tau-neutrino mass. Its high luminosity will also make the B-Factory an ideal place to study final states that can only be reached by two-photon exchange; for example, exotic meson states containing more than two quarks might be discovered. The impact of this broad experimental program will be an exceptionally broad and fundamental test of the validity of the Standard Model.

A B-Factory was considered by and endorsed in 1990 and 1992 by HEPAP Subpanels on the U.S. High Energy Physics Research Program. A DOE Office of Energy Research Committee reviewed the present proposal in March 1991, and found it to be technically sound. The project was also reviewed by the Joint DOE and NSF B-Factory Review Committee in July 1993 as part of the B-Factory site selection process. The report indicated that the cost estimate is credible and that construction could begin in FY 1994.

1. Title and Location of Project: B-Factory
Stanford Linear Accelertor Center (SLAC)

2a. Project No.: 94-G-304
2b. Construction Funded

9. Detail of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 33,000
1. Engineering design and inspection at 26 percent of construction costs, Item c	$ 29,100	
2. Project Management at 3 percent of Construction Costs, Item c	3,900	
b. Land and land rights	0	
c. Construction Costs		111,000
1. Accelerator Facilities	106,200	
2. Utilities	4,800	
d. Contingencies at approximately 23 percent of above costs		33,000
e. Total line item cost (Section 12.a. 1. (a))		177,000
f. Non-Federal Contribution		0 *
Net Federal line item cost		$177,000

*Non-Federal contribution: There is significant foreign involvement in the detector (see Section 12a).

1276

1. Title and Location of Project: B-Factory
Stanford Linear Accelertor Center (SLAC)

2a. Project No.: 94-G-304
2b. Construction Funded

10. Method of Performance

The B-Factory project is a collaboration of SLAC, Lawrence Berkeley Laboratory (LBL) and Lawrence Livermore National Laboratory (LLNL). It is possible that other laboratories (both U.S. and foreign) may join the project prior to construction especially in the detector area. Design of the technical components will be by the operating contractors, at this time SLAC, LBL, and LLNL. To the extent feasible, construction procurement and installation will be accomplished by fixed-price subcontracts awarded on the basis of competitive bidding.

11. Schedule of Project Funding and Other Related Funding Requirements

Total project cost	19,800	18,985	47,870	74,700	80,030	51,815	293,200
(f) Non-Federal contribution	0	0	0	0	0	0	0
(g) Net Federal total project cost	$ 19,800	$ 18,985	$ 47,870	$ 74,700	$ 80,030	$ 51,815	$293,200

b. Related annual costs (estimated life of project = 20 years)

1. Power costs for B-Factory	$ 9,100
2. Other operating costs for B-Factory	19,100
Total annual funding (in FY 1999 dollars)	$ 28,200

1277

1. Title and Location of Project:	B-Factory Stanford Linear Accelertor Center (SLAC)	2a. Project No.: 94-G-304 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Construction Line Item - explained in line items 8, 9, and 10.
   2. Other project costs
      (a) R&D Necessary to Complete: This will provide for the design and development of new components and for the fabrication and testing of prototypes. Includes R&D efforts at SLAC, LBL, LLNL, and for the detector, other potential collaborators. Significant foreign contributions are anticipated at the completion of discussions presently underway.
      (b) Pre-operations: This will include costs for systems checkout, operator training, and a several month commissioning period.
      (c) Capital Equipment: This will include test instruments and other general equipment to support the associated R&D.
      (d) Detector: This includes capital equipment funds for the initial B-Factory detector. There is significant foreign involvement in the detector (see (f) below).
      (e) Spares: Provides for spares of critical technical components with significant delivery times.
      (f) Non-Federal contribution: The total detector costs in 2(d) reflects cost savings of about $20,000,000 resulting primarily from the contribution of detector components and subsystems by non-U.S. collaborating institutions.

b. Related annual costs

   1. Includes power costs to operate the B-Factory.

   2. Includes costs for operations staff, materials, supplies, etc., to operate the B-Factory.

   We assume that when the B-Factory project construction is complete, the SLC based particle physics program will be discontinued. We estimate that when the B-Factory is operational, the overall operating costs at SLAC will be roughly the same as at present (inflation adjusted); therefore, no incremental annual funding is anticipated.

a/ Reflects Congressional Rescission of $3,350,000 in FY 1992.
b/ Congressional request for $30,000,000 reduced to $15,000,000 by Congressional action on FY 1993 request.

1. Title and Location of Project:	Fermilab Main Injector Fermi National Accelerator Laboratory	2a. Project No.: 92-G-302 2b. Construction Funded

8. Project Description, Justification and Scope

This project provides for the construction of a new accelerator, called the Fermilab Main Injector, which will replace the aging Fermilab Main Ring in all of its functions. It will provide particles for injection into the existing superconducting Tevatron accelerator, as well as for direct delivery to fixed target experimental and test beam areas. The accelerator is 3.3 km in circumference and it is capable of accelerating either protons or antiprotons to 150 GeV. It employs conventional iron core magnets. Also provided are five new beam transport lines which connect the Main Injector into the existing Fermilab accelerator complex, transport 120 GeV proton beam to the fixed target experimental areas, and provide particle beams for the testing and calibration of detector components and subsystems.

Many technical components will be recycled from the existing Main Ring, including quadrupole magnets, some power supplies and correction magnets, radiofrequency accelerating systems, controls system components, and diagnostic devices.

The Main Injector will be located in the southwest corner of the Fermilab site, and will be connected to the existing Tevatron ring enclosure at its F-Zero straight section.

Specifically provided for in the scope of the project are:

a. Construction of a 3.3 km ring enclosure with ancillary service buildings, and utilities; and the fabrication of new technical components including dipole magnets, high current power supplies, and vacuum systems.

b. Construction of beamline enclosures, service buildings, utilities, and technical components which are required to implement an 8 GeV Booster-to-Main Injector beamline, the 150 GeV proton and antiproton Main Injector-to-Tevatron transfer lines, and a 120 GeV Main Injector-to-Antiproton Production Target beamline.

c. Construction of the technical components required to implement the delivery of 120 GeV beam from the Main Injector to external fixed target and test beam experimental areas, and the construction of a new sub-station and 345KV power lines for distribution of electrical power to the Main Injector location.

1280

1. Title and Location of Project: Fermilab Main Injector
Fermi National Accelerator Laboratory

2a. Project No.: 92-G-302
2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

d. Modifications to the Tevatron ring enclosure at the F-Zero straight section, for installation of the 150 GeV proton and antiproton transfer lines.

e. Refurbishment and reinstallation in the Main Injector ring enclosure of those technical components which will be reused from the old Main Ring accelerator.

The primary purpose of this project is to greatly increase the Tevatron collider luminosity which can be delivered to the two existing collider detector experimental facilities at Fermilab. Fermilab is the only operational high energy physics facility in the world with sufficiently high energy to produce the top quark, which is the highest mass fundamental particle building block according to our current understanding of the basic structure of matter. Increasing the luminosity of the Fermilab proton-antiproton collider to at least $5x10^{31}cm^{-2}sec^{-1}$ will assure meaningful determination of the properties of the top quark, which has recently been discovered at Fermilab. The project will also significantly increase the number of protons which can be injected into the Tevatron for subsequent acceleration to 800 GeV and then extraction into the existing fixed target and test beam experimental areas, will replace or refurbish the 20 year old components of the existing main ring accelerator, and will eliminate the significant operational problems resulting from the main ring in the same tunnel with the superconducting Tevatron. Other important purposes are to provide a new capability of 120 GeV proton beams which can be used for fixed target physics research, and to provide beams year-round for the testing and collaboration of detector components and subsystems simultaneously with collider operations for physics research.

Increasing the collider luminosity requires increasing both the numbers of protons and of antiprotons injected into the Tevatron. The substantial increases in injection intensities result from the large effective aperture of the Main Injector accelerator and from its high repetition rate capability. These are achieved through tight beam focussing, high magnetic field quality, and elimination of the two vertical overpasses which had to be installed in the Main Ring during the 1980's in order to provide the collider interaction regions. The Main Injector will be capable of accelerating an intense beam of protons to 120 GeV every 1.5 seconds for the purpose of antiproton production, as compared to a 2.4 second cycle for the present Main Ring. The beam intensity which can be injected into the Tevatron by the Main Injector will approach 6×10^{13} protons each 60 second cycle, which is about two times greater than could be achieved with the old Main Ring. The Tevatron antiproton-proton colliding beam luminosity will be increased to at least 5×10^{31} $cm^{-2}sec^{-1}$. These performance goals are expected to be achieved after months of operational experience with the new accelerator.

1281

Fermi National Accelerator Laboratory

2a. Project No.: 92-G-302
2b. Construction Funded

9. Details of Cost Estimate*

		Item Cost	Total Cost
a.	Engineering Design Inspection and assembly at 17 percent of construction costs		$28,400
b.	Main Injector construction costs		167,900
	1. Conventional construction	$75,500	
	2. Special facilities	92,400	
c.	Contingencies at 17 percent of above costs		33,300
	Total line item cost		$229,600

* The annual escalation rates assumed for FY 1994 through FY 1998 are 3.3, 3.6, 3.7, 3.7, and 3.6 percent respectively.

10. Method of Performance

Design of facilities will be by the operating contractor and subcontractors as appropriate. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts awarded on the basis of competitive bids.

	$ 48,400	$ 52,000	$ 38,583	$ 15,855	$229,600
2. Other project costs					
(a) R&D costs necessary to complete construction	$ 0	$ 0	$ 0	$ 0	$ 18,400
(b) Pre-operating costs	0	0	1,000	1,000	2,000
(c) Capital equipment	100	150	0	0	1,000
(d) Inventories and Spares	1,000	3,500	3,800	0	8,300
Total other project costs	1,100	3,650	4,800	1,000	29,700
Total project costs	$ 49,500	$ 55,650	$ 43,383	$ 16,855	$259,300

b. Related annual costs (estimated life of project: 20 years)

1. Power costs for Main Injector slow spill operations	$5,400
2. Experimental areas operating costs for 120 GeV slow spill beam	1,200
Total related annual costs (in FY 1997 dollars)	$6,600

1. Title and Location of Project: Fermilab Main Injector
Fermi National Accelerator Laboratory

2a. Project No.: 92-G-302
2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs

(a) Line item - explained in items 8,9,10

2. Other project costs

(a) Direct R&D operating costs - This will provide for the design and development of new components and for the fabrication and testing of prototypes. R&D on all elements of the project, in order to optimize performance and minimize costs, is concentrated in the early years. Specifically included are the development of the high current dipole magnets and associated power supplies. A small number of Main Injector dipole magnets and power supplies will be fabricated and tested using R&D operating funds.

(b) Pre-operating costs - Includes personnel costs for a several month commissioning period.

(c) Capital equipment - Includes test instruments, electronics, and other general equipment to support 12.a.1 and 12.a.2.a.

(d) Spares and inventories - Provides for special process spares for the major technical components, primarily magnets and power supplies, and for an increase in common use inventories for Main Injector related items.

b. Related annual costs

Total incremental funding requirements - We assume that the Fermilab Tevatron complex will continue both its fixed target and its colliding beam research programs, with each running about 40% of the time on the average. The Main Injector replaces the present Main Ring in all of its functional roles, and it is designed to require about the same amount of power to operate for those purposes. The new Main Injector capability for extracted beam operations simultaneously with Tevatron operations for physics research will require an average increase in power plus other operating costs by about $6,600,000 annually. The operating costs in 12.b reflect the incremental demands of delivering 120 GeV protons to the fixed target experimental areas during Tevatron collider operations.

1284

NUCLEAR PHYSICS

PROGRAM MISSION

The Nuclear Physics program of the Department of Energy (DOE) has the lead responsibility for Federal support of nuclear physics research and supports fundamental research activities under the mandate provided in Public Law 95-91 which established the Department. The primary Mission of the program is to develop and support the basic research scientists and facilities, and to foster the technical and scientific activities needed to understand the structure and interactions of atomic nuclei, and to understand the fundamental forces and particles of nature as manifested in extended nuclear matter. Atomic nuclei are approximately described as a collection of nucleons (protons and neutrons), bound together by the mechanism of exchange of pions (pi mesons). The research forefront in nuclear physics now requires incorporation of the quark substructure of the nucleon into the understanding of nuclear structure. Quarks, which are the most elemental building blocks of matter, are bound together in groups of three by the exchange of gluons to form the nucleons. Attendant upon this core mission are responsibilities to enlarge and diversify the Nation's pool of technically trained talent, to facilitate transfer of technology and knowledge acquired to support the Nation's economic base, and to provide leadership in the world's cooperative efforts in the peaceful development of science. The program works in close coordination with the Nuclear Physics program at the National Science Foundation (NSF), and jointly with the NSF charters the Nuclear Science Advisory Committee to assist in setting scientific priorities. The programs intent is to be closely aligned with the Administration's science policies as put forward in "Science in the National Interest."

The GOAL of the Nuclear Physics program is to understand the structure of atomic nuclei and the fundamental forces required to hold their constituents in place by a series of systematic scientific investigations.

The OBJECTIVES related to the goal are to:

- o Conduct a program of maximum effectiveness to provide new insights into the nature of energy and matter, based on evaluation by rigorous peer review.

PROGRAM MISSION - NUCLEAR PHYSICS (Cont'd)

- Conceive, develop, construct, and operate world class scientific accelerator facilities in a timely, and effective manner. In the execution of this responsibility together with other Energy Research projects, act as the Nation's leader in developing standards and management techniques to optimize construction and operations of facilities in a cost effective, safe, and environmentally benign way.

- Leverage United States objectives by means of International cooperation through exchanges of scientists and participation in internationally cooperative projects.

- Continue the advanced education and training activities of young scientists to maintain the skills and conceptual underpinning of the Nation's broad array of nuclear based technologies.

PERFORMANCE MEASURES:

1. Ascertain the appropriateness and quality of the entire research program by rigorous peer reviews conducted by internationally recognized scientific experts. Maintain the highest quality research by taking appropriate corrective management actions based on results of the reviews.

2. Use the assistance of technical experts to monitor the performance in scope, costs, and schedule of construction projects. Measure construction project performance against cost and schedule milestones contained in the project plans.

3. Use peer reviews and user feedback to monitor the effectiveness of facility operations. Evaluate facility performance against objectives set in program guidance letters based on funding availability. Measure beam hour availability and user support against guidelines developed for the Scientific Facility User Initiative.

4. Compare overall progress of the field against the scientific priorities recommended in the long range plans that are regularly provided by the DOE/NSF Nuclear Science Advisory Committee (NSAC).

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- CEBAF construction has been completed and the experimental program has begun.

PROGRAM MISSION - NUCLEAR PHYSICS (Cont'd)

- Relativistic Heavy Ion Collider (RHIC) construction at Brookhaven National Laboratory (BNL) has been rebaselined to account for funding reduction in FY 1996. The rebaselining increased the TEC from $475,250,000 to $486,870,000, increased the TPC from $595,250,000 to $616,530,000 and delays completion of the project by 3 months from 2nd Quarter FY 1999 to 3rd Quarter FY 1999. All of the quadrupole and sextupole, and over 70% of the dipole superconducting magnets produced by industry have been delivered, every one delivered to date has substantially exceeded specifications and over one-half of them have been installed in the accelerator tunnel. Progress according to schedule has occurred in the fabrication of RHIC detectors, including the additional experimental equipment recommended by NSAC.

- Completion of the Radioactive Ion Beam (RIB) facility at Oak Ridge National Laboratory (ORNL) permits initiation of the experimental program in astrophysics and unstable nuclei in the summer of 1996.

- The joint US/Canadian Sudbury Neutrino Observatory (SNO) project will be completed in January 1997 to initiate investigation of the solar burning process.

- With transferral of operation of the Clinton P. Anderson Meson Physics Facility (LAMPF) at Los Alamos National Laboratory (LANL) to Defense Programs and termination of the research program in the main experimental area, research efforts have been refocused on thermal and ultra-cold neutron experiments at the Los Alamos Neutron Scattering Center (LANSCE) facility and other experiments on an as-available basis.

- Utilization of the new Gammasphere detector at Lawrence Berkeley National Laboratory (LBNL) has led to the possible discovery of ultra-deformed nuclear states, whose lengths are 3 times as big as their widths.

- Having completed the investigation of anomalous electron-positron pair creation reported by foreign scientists, the APEX detector at Argonne National Laboratory (ANL) will be phased out. Gammasphere will be temporarily relocated to ANL and coupled with the existing mass spectrometer there to take advantage of a timely opportunity for innovative research.

- The Nuclear Physics request includes $140,078,000 to maintain support of the Department's scientific user facilities. Approximately 16% of this amount is associated with the continuation of the science user facilities initiative contained in the FY 1996 budget request. This funding will significantly provide research time for thousands of scientists in universities, Federal agencies, and U.S. companies. It will also leverage both Federally and privately sponsored research consistent with the Administration's strategy for enhancing the U.S. National science investment.

MEDIUM ENERGY NUCLEAR PHYSICS
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Nuclear Physics Program supports the basic research necessary to identify and understand the fundamental features of atomic nuclei and their interactions. The Medium Energy Nuclear Physics subprogram supports academic fundamental research, and facility operations and research at electron and proton accelerator facilities at the energies of interest to nuclear physics. In addition, the subprogram supports research at accelerators operated by other Department of Energy programs (e.g., High Energy Physics and Basic Energy Sciences) and at other unique domestic or foreign facilities. Two national accelerator facilities are operated entirely under the Medium Energy subprogram - the Continuous Electron Beam Accelerator Facility (CEBAF) in Newport News, Virginia, operated by the Southeastern Universities Research Association, and the Bates Linear Accelerator Center in Middleton, Massachusetts, operated by the Massachusetts Institute of Technology. These accelerator facilities serve a nationwide community of Department of Energy- and National Science Foundation-supported scientists from over 100 American institutions, of which over 90% are universities. Both facilities provide major contributions to American education at all levels and new technical and innovative discoveries which result in important Technology Transfer and services to American industry and medicine. At both CEBAF and Bates, the National Science Foundation has made a major contribution to a new experimental apparatus. A significant number of foreign scientists collaborate in the research programs of both facilities. The planned research program at the new Continuous Electron Beam Accelerator Facility Laboratory, for example, involves 540 scientists from 17 foreign countries; 81 of these scientists are from Conseil Europeen pour la Recherche Nucleaire (CERN) member states. At CEBAF, foreign collaborators have also made major investments in experimental equipment.

The research programs supported at these facilities are ultimately aimed at achieving an understanding of the structure of the atomic nucleus in terms of the quarks and gluons, the objects which apparently combine in different ways to make all the other sub-atomic particles. Just as important is the achievement of an understanding of the "strong force", one of only four forces in nature, which holds the nucleus of the atom together. Research efforts include studies of the role of excited states of protons and neutrons in nuclear structure, investigations of the role of specific quarks in the structure of protons and neutrons, studies of the symmetries in the behavior of the laws of physics, investigations of how the properties of protons and neutrons change when imbedded in the nuclear medium, measurements with beams of electrons or protons whose "spins" have all been lined up in the same direction (polarizing the beams) to determine unique "structure functions" which pin down particular models of nuclear structure, and studies of how particles interact with each other inside the nucleus.

I. **Mission Supporting Goals and Objectives: MEDIUM ENERGY NUCLEAR PHYSICS** (Cont'd)

Beginning, in FY 1996, operation of the Clinton P. Anderson Meson Physics Facility (LAMPF) has been supported by DOE Defense Programs.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Medium Energy Research	$ 41,017	$ 49,755	$ 52,775	$ + 3,020	+ 6.1%
Facility Operations					
Los Alamos Meson Physics Facility	$ 23,450	$ 200	$ 200	0	0.0%
Bates Linear Accelerator Center	9,857	10,200	10,900	+ 700	+ 6.9%
CEBAF	48,600	36,900*	40,500	+ 3,600	+ 9.8%
Total, Medium Energy Nuclear Physics	$ 122,924	$ 97,055*	$ 104,375	$ + 7,320	+ 7.5%

* In FY 1996 a request will be made to reprogram $2,575,000 from AIP construction to Medium Energy Facility Operations ($2,200,000), and AIP operating ($375,000).

III. Performance Summary:

FY 1995 Accomplishments:

MEDIUM ENERGY RESEARCH:

- At the CEBAF laboratory, scientists completed preparations for the Hall C experimental research program. The Hall B CLAS detector magnet has been installed and has been operated at superconducting temperatures.

- At the Bates Laboratory, MIT scientists and collaborators carried out new measurements in the South Experimental Hall using a new polarimeter. Scientists also carried out measurements on the new "SAMPLE" experiment in the North Hall which uses "symmetry violation" to examine specific quark components (strange quarks) in the proton.

III. Performance Summary: MEDIUM ENERGY NUCLEAR PHYSICS (Cont'd)

- At MIT, scientists are completing detectors for use in Hall A at CEBAF. MIT scientists and collaborators carried out measurements with pion beams at the Clinton P. Anderson Meson Physics Facility at Los Alamos National Laboratory, and at the Paul Scherrer Institute in Switzerland.

- MIT scientists have successfully led the U.S. collaboration of university and National Laboratory scientisis in the development and construction of a new detector and target system for the HERMES experiment which commenced at the DESY laboratory in Hamburg, Germany. This experiment is measuring where the "spin" of the proton comes from.

- At Brookhaven National Laboratory, scientists and collaborators have carried out measurements on the shape of the proton using the Laser Electron Gamma Source facility. Results show that the proton is deformed and looks somewhat like a pancake.

- Brookhaven scientists and collaborators at the Alternating Gradient Synchrotron have completed analysis of an effort to search for a predicted particle consisting of six quarks.

- Argonne National Laboratory scientists have completed development of a target system for Hall C experiments at CEBAF; Argonne also has a major collaborative role in the HERMES experiment in Germany. Argonne scientists have completed a major study of the structure of the deuteron at the accelerator in Novosibirsk, Russia.

- At the Clinton P. Anderson Meson Physics Facility at Los Alamos National Laboratory, scientists and collaborators carried out high priority measurements in search of neutrino oscillations. If oscillations are found, then neutrinos would have mass, in disagreement with our present understanding of physics!

- Los Alamos scientists and collaborators prepared to carry out measurements at Fermilab to examine structure in the neutron and proton. Los Alamos scientists and collaborators are planning for a major future program using polarized protons at the Relativistic Heavy Ion Collider which is presently under construction at Brookhaven.

- The university program continued to support a broad program of research in Medium Energy Nuclear Physics utilizing not only all of the accelerator facilities supported under the Medium Energy Program, but also using other U.S. and international accelerator laboratories. Also supported was non-accelerator based research at a number of international sites.

- Funding in the amount of $1,833,000 and $225,000 has been transferred to the SBIR and STTR program, respectively.

III. Performance Summary: MEDIUM ENERGY NUCLEAR PHYSICS (Cont'd)

FACILITY OPERATIONS:

- o CEBAF was completed and work continued on preparations for the experimental program in Hall C. The accelerator operated about 2500 hours for commissioning.

- o The Bates accelerator operated 2310 hours for research. Continuous beam (not pulsed) extraction studies from the new South Hall ring were carried out.

- o The Clinton P. Anderson Meson Physics Facility operated for approximately 2550 hours for research. This was the last year of support for accelerator operations by the Nuclear Physics Program. Future operation of the accelerator will be supported by Defense Programs.

FY 1996 Accomplishments (to date and planned):

MEDIUM ENERGY RESEARCH:

- o At CEBAF, the Hall C experimental research program is underway. Hall A experimental equipment will be complete and the research program begun. The Hall B CLAS detector will be completed and calibration activities will be initiated.

- o At the Bates accelerator, scientists and collaborators will carry out new measurements in the South Experimental Hall using the new polarimeter and newly installed detectors which make measurements outside the scattering plane. Scientists will continue measurements on the "SAMPLE" experiment in the North Hall which uses "symmetry violation" to examine the possibility of specific quark components (strange quarks) in the proton.

- o MIT scientists will complete installation of detectors in the new Hall A twin spectrometers at CEBAF.

- o MIT scientists and collaborators will carry out the HERMES experiment in Hamburg, Germany. This experiment is measuring what components of the proton or neutron determine the "spin" of these particles, an important scientific issue in our present understanding.

- o At Brookhaven National Laboratory, Laser Electron Gamma Source scientists will begin work on detector modifications and a unique hydrogen-ice target which will allow alignment of the "spins" of the proton and the deuteron in the target independently. This will enable a new program to look more deeply into the structure of the proton and neutron.

III. Performance Summary: MEDIUM ENERGY NUCLEAR PHYSICS (Cont'd)

- Brookhaven scientists and collaborators at the Alternating Gradient Synchrotron are pursuing new experiments to look at the behavior of a strange quark in nuclei and to do spectroscopy of other particles. A major part of these efforts involves the installation of large detectors from Los Alamos and Stanford.

- Argonne National Laboratory scientists are beginning a major series of experimental efforts at CEBAF and will continue the HERMES experiment in Germany.

- At the Clinton P. Anderson Meson Physics Facility at Los Alamos National Laboratory, scientists and collaborators may continue the high priority measurements in search of neutrino oscillations if DOE Defense Program operations of LAMPF allows the high intensity proton beam into Area A. If oscillations are found, then neutrinos would have mass, in disagreement with our present understanding of the laws of physics!

- Los Alamos scientists and collaborators will carry out measurements at Fermilab to examine structure in the proton and neutron. Planning is also underway for a major future program using polarized protons at the Relativistic Heavy Ion Collider (RHIC) which is presently under construction at BNL.

- The university program will continue to support a broad program of research in Medium Energy Nuclear Physics utilizing not only all of the accelerator facilities supported under the Medium Energy Program, but also using other U.S. and international accelerator laboratories. Also supported will be non-accelerator based research at a number of international sites.

- Funding in the amount of $1,965,000 and $308,000 has been budgeted for the SBIR and STTR program, respectively.

FACILITY OPERATIONS:

- CEBAF will be operational for research into Hall C. The Hall B and Hall A detectors are still being completed. Accelerator time for research is 3000 hours, but will increase to 4500 hours if proposed reprogramming is approved.

- The MIT/Bates accelerator will operate 2000 hours for research. Both research operations and continuing upgrading of the accelerator complex will be underway.

- The Clinton P. Anderson Meson Physics Facility is no longer operated by the Nuclear Physics Program. Operations will be supported by DOE Defense Programs.

III. Performance Summary: MEDIUM ENERGY NUCLEAR PHYSICS (Cont'd)

FY 1997 Planned Accomplishments

MEDIUM ENERGY RESEARCH:

- At CEBAF, the experimental research program will be fully underway. CEBAF and collaborating scientists will carry out the approved research program, as determined by the CEBAF Program Advisory Committee. Important experiments will include studies of the charge structure of the neutron in Hall C, measurements of the electric form factor of the proton in Hall A, and studies of the excited states of the proton will begin in Hall B.

- At MIT/Bates, MIT scientists and collaborators will carry out new measurements in the South Experimental Hall using the new polarimeter and the new detectors. Continuous, rather than pulsed beams will be available to the South Hall. Efforts to utilize a new internal target in the South Hall ring will be underway. Important experiments will include "symmetry violation" studies on the deuteron and measurements of the transition of the proton to its excited state.

- MIT scientists and collaborators will continue to carry out the HERMES experiment in Hamburg, Germany. This experiment will measure what components of the proton or neutron determine the "spin" of these particles, an important scientific issue in our present understanding.

- At Brookhaven National Laboratory, Laser Electron Gamma Source scientists plan to build a major detector modification and a unique ice target containing polarized hydrogen which will allow polarization of the proton or the deuteron in the target independently. This will enable a new program to look more deeply into the structure of the proton and neutron.

- Brookhaven scientists and collaborators at the Alternating Gradient Synchrotron will be pursuing new experiments to look at the behavior of a strange quark in nuclei and to do spectroscopy of other particles. These efforts involved the installation of large detectors from Los Alamos and Stanford.

- Argonne National Laboratory scientists will be undertaking a major series of experiments at CEBAF and will continue the HERMES experiment in Germany.

- At the Clinton P. Anderson Meson Physics Facility, Los Alamos National Laboratory scientists and collaborators may continue to carry out high priority measurements in search of neutrino oscillations, depending on review of existing results and whether DOE Defense Program operations allows the high intensity proton beam into Area A. If oscillations are found, then neutrinos would have mass, in disagreement with our present understanding of the laws of physics!

III. Performance Summary: MEDIUM ENERGY NUCLEAR PHYSICS (Cont'd)

- Los Alamos scientists and collaborators will carry out measurements at Fermilab to examine structure in the neutron and proton. Planning is also underway for a major program using polarized protons at the Relativistic Heavy Ion Collider which is presently under construction at Brookhaven.

- The university program will continue to support a broad program of research in Medium Energy Nuclear Physics utilizing not only all of the accelerator facilities supported under the Medium Energy Program, but also using other U.S. and international accelerator laboratories. Also supported will be non-accelerator based research at a number of international sites.

- Funding in the amount of $4,073,000 has been budgeted for the SBIR program.

FACILITY OPERATIONS:

- CEBAF will be operational for research in Halls A, B, and C. Accelerator time for research is planned to be 4500 hours.

- The MIT/Bates accelerator will operate 2500 hours for research. Both research operations and continuing upgrading of the accelerator complex will be under way.

- The Clinton P. Anderson Meson Physics Facility (LAMPF) is no longer operated by the Nuclear Physics Program. Operations are supported by DOE Defense Programs.

Explanation of Funding Changes FY 1996 to FY 1997:

- Funding for Bates operation is increased by $700,000 (6.9%) over FY 1996 to increase beam time for research to 2500 hours to take advantage of recently completed unique new facilities.

- The budget request reflects a $3,600,000 increase for CEBAF operations which would increase operating hours from 3000 to 4500. However, if the requested FY 1996 reprogramming of $2,200,000 into CEBAF operations is approved, the FY 1997 CEBAF operations funding provides a cost of living increase and the same number of hours for research in both years (4500).

- SBIR has been increased to $4,073,000 from $1,965,000 in FY 1996. The SBIR allocation is included under Medium Energy Research.

HEAVY ION NUCLEAR PHYSICS
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Heavy Ion Nuclear Physics subprogram supports research directed at understanding the properties and behavior of atomic nuclei and nuclear matter over a wide range of conditions. These conditions are created in nucleus-nucleus collisions using beams of heavy ions. At low bombarding energies, research is focussed on the study of nuclei which are only gently excited (cool nuclear matter), but taken to their limits of deformation and to their limits of isotopic stability by adding or subtracting protons (or neutrons) to form short-lived, proton-rich (or neutron-rich) nuclei. With higher energy heavy-ion beams very highly excited nuclei (warm nuclear matter) can be formed and studied which are believed to vaporize in a process analogous to the liquid-gas phase transition of heated water. At relativistic energies, the properties of hot dense nuclear matter are studied, with a goal of observing the deconfinement of normal matter into a new form of matter, a quark-gluon plasma. Accelerators located at two universities (Texas A&M and Yale) and three National Laboratories (Argonne, Brookhaven and Berkeley) are supported and maintained by the Heavy Ion Nuclear Physics subprogram for these studies. The National Laboratory facilities are utilized by Department of Energy (DOE), National Science Foundation (NSF) and foreign supported researchers whose experiments undergo peer review by Program Advisory Committees prior to approval for beam time. DOE Heavy Ion Nuclear Physics supported researchers, at both universities and national laboratories, also use NSF and foreign accelerator facilities for their studies.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Heavy Ion Research					
Nuclear Structure and Reaction Studies	$ 15,161	$ 15,655	$ 15,880	$+ 225	+ 1.4%
Relativistic Heavy Ion Studies	23,528	21,770	23,210	+ 1,440	+ 6.6%
Heavy Ion Facility Operations & R&D					
Low Energy (ANL, LBNL, Yale, Texas A&M)	10,675	11,770	12,005	+ 235	+ 2.0%
BNL Tandem/AGS and RHIC Operations	8,690	15,900	17,550	+ 1,650	+ 10.4%
Accelerator R&D	1,710	1,535	1,555	+ 20	+ 1.3%
Total, Heavy Ion Nuclear Physics	$ 59,764	$ 66,630	$ 70,200	$+ 3,570	+ 5.4%

III. Performance Summary:

FY 1995 Accomplishments:

Nuclear Structure and Reaction Studies

- The Gammasphere detector under construction at the Lawrence Berkeley National Laboratory (LBNL) 88-inch Cyclotron initiated experiments with over half its final configuration of gamma-ray detectors and found possible evidence of a previously unobserved nuclear shape.

- Scientists at the LBNL 88-inch Cyclotron demonstrated that short-lived radioactive atoms can be trapped with laser light and initiated experiments studying the fundamental weak interaction.

- At the Argonne Tandem-Linac Accelerator System (ATLAS) facility researchers observed the three heaviest nuclei, thus far known, exhibiting radioactive proton emission and used the APEX detector to measure the production of electron-positron pairs in heavy ion collisions to investigate suggestions of unexpected physics raised in previous measurements in Germany.

III. Performance Summary: HEAVY ION NUCLEAR PHYSICS (Cont'd)

Relativistic Heavy Ion Studies

- Researchers successfully initiated major experiments and performed measurements with relativistic heavy ions at the Alternating Gradient Synchrotron (AGS) at Brookhaven National Laboratory (BNL) and at the Super Proton Synchrotron (SPS) at CERN studying nuclear matter at high temperatures and densities.

- Approximately 250 scientists and students contributed to design and construction efforts on the approved detectors planned for the RHIC facility.

- Funding in the amount of $1,410,000 has been transferred to the SBIR program.

Heavy Ion Facility Operations and R&D

- The ANL ATLAS facility provided 4589 hours of heavy ion beams for experiments involving over 150 scientists and students focussed on nuclear structure and reaction mechanism studies.

- The LBNL 88-inch Cyclotron provided 4665 hours of heavy ion beams for a research program focussed on utilizing Gammasphere for nuclear structure studies and involving over 250 scientists and students. In addition over 400 hours of beam were utilized by over 50 scientists and engineers in an independently supported program to improve the radiation hardness of integrated circuits to be used for space applications.

- The tandem accelerator at Yale University and the superconducting cyclotron at Texas A&M University each provided over 2500 hours of beam for nuclear physics research involving primarily on-campus researchers and students.

- The Tandem/Booster/AGS accelerator complex at BNL provided 595 hours of relativistic energy gold (Au) beams for research and continued activities needed to prepare the facility as an injector for RHIC. The tandem facility, when not being used as an injector for the AGS, was utilized for an independently supported program studying the effects of radiation on integrated circuits in measurements involving over 45 institutions.

- RHIC start-up and inventory funds were used to start liquid helium plant operations, prepare for injection beam line tests, and procure special process, accelerator-component spares. Detector R&D funds were used to develop techniques and prototype units for RHIC detectors.

1300

III. Performance Summary: HEAVY ION NUCLEAR PHYSICS (Cont'd)

FY 1996 Accomplishments (to date and planned):

Nuclear Structure and Reaction Studies

- The Gammasphere detector at the 88-inch Cyclotron at LBNL will be used to make significant advancements in our understanding of the structure of nuclei under conditions of extreme deformation and large angular momentum.
- LBNL scientists at the 88-inch Cyclotron will further develop capabilities for trapping polarized radioactive atoms for experimental tests of the fundamental weak interaction.
- At the ANL ATLAS facility, the structure of short-lived, proton-rich nuclei will be studied and the puzzle of anomalous electron-positron pair production in heavy ion collisions, studied with the APEX detector, is expected to be resolved.
- At the Texas A&M cyclotron measurements studying the compressibility of nuclear matter and at the Yale tandem facility cross section measurements important for astrophysics processes will be carried out by scientists and students.

Relativistic Heavy Ion Studies

- Data obtained from the relativistic heavy ion experiments at the AGS at BNL and SPS at CERN will provide the most severe tests to date of theoretical model calculations of the properties of hot dense nuclear matter.
- An increasing number of scientists and students from universities and national laboratories will be involved in the design and construction of the approved detectors planned for RHIC.
- Funding in the amount of $945,000 has been budgeted for the SBIR program.

Heavy Ion Facility Operations & R&D

- The ANL ATLAS facility will provide 5000 hours of beam for a research program focussed on studies of nuclear structure and reactions.
- The LBNL 88-inch Cyclotron will provide 5000 hours of beam for a research focussed on studies of nuclear structure with Gammasphere. In addition approximately 400 hours of beam time will be utilized for radiation hardening research activities.

III. Performance Summary: HEAVY ION NUCLEAR PHYSICS (Cont'd)

- The tandem accelerator at Yale and the superconducting cyclotron at Texas A&M will each provide 2500 hours of beam for research involving primarily on-campus researchers and students.

- The Tandem/Booster/AGS accelerator complex at BNL will provide 1000 hours of relativistic heavy ion beams for experiments studying the properties of nuclear matter at high temperatures and densities, and continue its preparations to act as the injector for RHIC. The tandem injector will also support an independently funded program on susceptibility of space-based electronic circuits to cosmic ray damage and for production of "micro-pore" filters.

- RHIC start-up and inventory funds will be used to conduct first beam tests of the RHIC injection line, commission the beam distribution system and procure special process spares. The first completed sextant of the collider ring will complete cooldown tests. Commissioning of the cryogenic refrigeration will be completed.

- Accelerator physicists at ANL and LBNL will perform R&D on improving ion source, extraction and transport systems for radioactive ion beams.

1302

FY 1997 Planned Accomplishments:

Nuclear Structure and Reaction Studies

- Gammasphere will continue its nuclear structure research program at the LBNL 88-inch cyclotron for three Quarters. In the 4th Quarter of FY 1997 Gammasphere will be moved for approximately a year to the ANL ATLAS facility for research coupled with existing experimental equipment there.

- The APEX detector at ATLAS will have accumulated sufficient data to have resolved the puzzle of anomalous of electron-positron pair production in heavy ion collisions. Unless unexpected physics appears, APEX operations will be phased out.

- LBNL scientists at the 88-inch Cyclotron will continue studies of the fundamental weak interaction with trapped polarized radioactive atoms and initiate studies focussed on producing and observing "superheavy" nuclei ($A \geq 112$).

- At the Texas A&M cyclotron measurements of the compressibility of nuclear matter and element formation processes relevant to astrophysics, and at the Yale tandem accelerator facility cross section measurements important for nuclear astrophysics will be performed.

III. Performance Summary: HEAVY ION NUCLEAR PHYSICS (Cont'd)

Relativistic Heavy Ion Studies

- At the AGS at BNL and the SPS at CERN several major relativistic heavy ion experiments will continue investigations of the behavior of hot dense nuclear matter and searches for exotic particles.

- An increased number of scientists and students will be involved in the assembly of detectors in the RHIC experimental halls.

- Funding in the amount of $520,000 has been budgeted for the SBIR program.

Heavy Ion Facility Operations & R&D

- The ANL ATLAS facility will provide 4600 hours of beam for an experimental program focussed on nuclear structure and reaction studies.

- The LBNL 88-inch Cyclotron will provide 4700 hours of beam for a research program focussed on the use of Gammasphere for nuclear structure studies. In addition approximately 400 hours of beam time will be utilized for radiation hardening research for space-based electronics packages.

- The tandem accelerator at Yale and the superconducting cyclotron at Texas A&M will each provide 2500 hours of beam for research involving primarily on-campus researchers and students.

- The Tandem/Booster/AGS Accelerator complex at BNL will provide 1000 hours of relativistic gold (Au) beams for experiments studying the properties of nuclear matter at high temperatures and densities and continue its preparations to act as the injector for RHIC. The tandem injector will also support an independently funded program on susceptibility of space-based electronic circuits to cosmic ray damage and for production of "micro-pore" filters.

- RHIC start-up funds will be used to inject beams into a fully instrumented sextant of the RHIC collider ring, a major milestone of the RHIC project. RHIC inventory funds will be used to procure special process spares.

- Accelerator physicists at ANL and LBNL will continue R&D on improving ion source, extraction and transport systems for radioactive ion beams.

1303

III. Performance Summary: HEAVY ION NUCLEAR PHYSICS (Cont'd)

Explanation of Funding Changes FY 1996 to FY 1997:

- o FY 1997 funding for Heavy Ion Research has been increased by about 4.4% compared to FY 1996.
  - Nuclear Structure and Reaction Studies will get a 1.6% increase over FY 1996.
  - In Relativistic Heavy Ion Studies, $750,000 will be added to BNL for needed buildup of the research program associated with RHIC, and the remaining program will get a roughly cost of living increase (3.2%).
- o FY 1997 funding for Heavy Ion Facility Operations has been increased by about 6.5% compared with FY 1996 levels.
  - The increase of $1,650,000 for BNL Tandem/AGS and RHIC Operations reflects a $150,000 (2%) increase for Tandem/AGS operations and $1,500,000 is the planned increase of pre-operations and inventory funding for the RHIC Project from $8,500,000 in FY 1996 to $10,000,000 in FY 1997.
  - Other facility operations will have a 2.0% increase over FY 1996. Research time available at the 88-inch cyclotron and Atlas accelerator facilities has been somewhat reduced to accommodate the transfer of Gammasphere.

LOW ENERGY NUCLEAR PHYSICS
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Low Energy Nuclear Physics subprogram supports research directed at addressing issues in nuclear astrophysics, the understanding of the behavior of nucleons at the surface of the nucleus as well as the collective behavior of the entire ensemble of nucleons acting in concert; nuclear reaction mechanisms; and experimental tests of fundamental symmetries. The last of these categories can often be accomplished without the use of accelerators. The study of neutrinos from the sun, whose rate of production is not understood, is an example. University-based research is an important feature of the Low Energy Program. Since most of the required facilities are relatively small, they are appropriate for sitting on university campuses, where they provide unique opportunities for hands-on training of nuclear experimentalists who are so important to the future of this field. Many of these scientists after obtaining their Ph.D.'s, contribute to a wide variety of nuclear technology programs of interest to the DOE. Two such facilities located at two universities (Duke University and the University of Washington) are supported and maintained by the Low Energy Nuclear Physics Program and a Radioactive Ion Beams facility for producing beams of unstable nuclei is being developed at Oak Ridge National Laboratory (ORNL). Included in this sub-program are activities that are aimed at providing information services on critical nuclear data and have as a goal the compilation and dissemination of an accurate and complete nuclear data information base that is readily accessible and user oriented. The activities in this sub-program are conducted in three specific areas: Astrophysics and Fundamental Interactions, Structure of Nuclei, and Facility Operations (Facilities at ORNL, Duke University and the University of Washington as well as the National Nuclear Data Center at Brookhaven National Laboratory (BNL).

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Astrophysics and Fundamental Interactions	$ 6,720	$ 8,587	$ 9,140	$+ 553	+ 6.4%
Structure of Nuclei	8,423	8,362	8,430	+ 68	+ 0.8%
Facility Operations	8,195	9,121	10,230	+ 1,109	+ 12.2%
Total, Low Energy Nuclear Physics	$ 23,338	$ 26,070	$ 27,800	$+ 1,730	+ 6.6%

III. Performance Summary:

FY 1995 Accomplishments:

Astrophysics and Fundamental Interactions

- New reaction measurements using the low beam energies at the Duke University accelerator have led to a sensitive diagnostic tool for probing the mixing of material in the interior of giant stars.

- The international collaboration to measure the solar neutrino flux using the GALLEX facility in Italy has completed a calibration of its system using an intense radioactive source, and has solidly established that there is a 40% deficit of solar neutrinos.

- The joint US-Russian solar neutrino detection project, the Soviet-American Gallium Experiment (SAGE), has also completed a calibration of the detectors using a radioactive source. The final results also showed a deficit of solar neutrinos and agree with the GALLEX results.

- The underlying origin of the solar neutrino deficit will be investigated by a joint US-Canadian project: the Sudbury Neutrino Observatory (SNO). This observatory is in a cavity 70 feet in diameter and 110 feet in height excavated 6,800 feet below the earth's surface. This year the SNO cavity was completed and scrupulously cleaned of residual dust. The major detector at SNO will consist of 11,000 light sensors that are used to detect signals from 1,000 tons of heavy water. The upper portion of the support structure has been completed and 5,500 light sensors have been installed.

- University based measurements of the rate of capture of protons by light nuclei have established a key astrophysical process for the creation of chemical elements process in blue stars.

- Precision measurements of radioactive decay of lithium and boron nuclei provided the most stringent test yet of the theory of this class of nuclear disintegration.

- A new probe of stellar nucleosynthesis has been established with the discovery of new low energy resonances in neutron capture on Barium isotopes at the Oak Ridge Electron Accelerator (ORELA).

- In an effort to resolve discrepancies in the elemental composition of stars in globular clusters that are used to determine the age of the galaxy, measurements have been started on the reaction rates of helium and sodium isotopes.

1306

III. Performance Summary: LOW ENERGY NUCLEAR PHYSICS (Cont'd)

Structure of Nuclei

- o Using special detectors, proton radioactivity has been discovered in some of the heavy elements, including bismuth.

- o Cold neutrons of extremely low energy provide a unique probe for the investigation of the origin of symmetry in nature. Present research at the National Institutes of Science and Technology's cold-neutron facility has made the most accurate measurements of the fundamental radioactive decay of the neutron, to shed light on the "arrow of time."

- o At San Jose State University, a personal computer-based program for interactively accessing nuclear structure data has been developed and issued for general use.

- o Funding in the amount of $1,265,000 has been transferred to the SBIR program.

Facility Operations

- o The Radioactive Ion Beam facility at ORNL has had its injector installed, tested, and commissioned, and low-intensity commissioning of the facility has been started.

- o ORNL's Radioactive Ion Beam facility personnel have completed transfer of ownership, shipment, and initial stages of installation of the $3,000,000 Daresbury Recoil Separator (DRS) that has been donated by the United Kingdom.

- o The National Nuclear Data Center at Brookhaven, which manages the U.S. part of the international data base, has serviced 81,000 retrievals. The level of services has increased 60% over the average yearly service rate in the past decade.

FY 1996 Accomplishments (to date and planned)

Astrophysics and Fundamental Interactions

- o A new determination of the up-quark and the down-quark mass difference will be done at the Duke University accelerator laboratory using new neutron-neutron scattering measurements.

- o The lower portion of the Sudbury Neutrino Observatory photomultiplier structure will be completed.

1907

III. Performance Summary: LOW ENERGY NUCLEAR PHYSICS (Cont'd)

- o Production will start on a special array of ^{3}He detectors that will provide an improved neutral current measurement capability at the Sudbury Neutrino Observatory.
- o Construction will be complete for the cold neutron experiment located at the National Institute for Standards and Technology.
- o Theories of the creation of the elements in the Big Bang will be tested by reaction rate measurements on light nuclei using specially built small apparatus at the Colorado School of Mines.

Structure of Nuclei

- o Chaotic effects in the excitation of nuclei will be investigated with definitive experiments.
- o Approaches will be developed for studying nuclei with neutrons to complement data from heavy ion reactions.
- o The nuclear force will be studied in nuclei with abnormally high ratios of protons to neutrons at the ORNL Radioactive Ion Beam Recoil Mass Separator.
- o An updated personal computer data base developed at San Jose State University will allow scientists and engineers to incorporate this program into their own data processing and modelling programs.
- o Funding in the amount of $1,200,000 has been budgeted for the SBIR program.

Facility Operations

- o The ORNL Radioactive Ion Beam facility will go into routine operation as a national user facility with peer reviewed and approved experiments. The facility will operate 1800 hours with an expected 1200 hours of beam on target.
- o The National Nuclear Data Center will implement a major upgrade of its on-line data access system that serves as the USA's commitment to international participation.
- o The National Nuclear Data Center will begin a pilot project to link its Nuclear Science References data base to the American Physical Society's journal so that users can progress from the bibliographic database to full articles and experimental data bases.

1308

III. Performance Summary: LOW ENERGY NUCLEAR PHYSICS (Cont'd)

FY 1997 Planned Accomplishments:

Astrophysics and Fundamental Interactions

- Newly developed neutral current detectors will be installed at the Sudbury Neutrino Observatory.
- One of the most important reactions in present day nuclear astrophysics, that is crucial to calculations of elemental abundances and energy release in supernova explosions, will be remeasured in order to resolve a long standing discrepancy in existing measurements.
- A new fundamental test of time reversal invariance in nuclei will be made at the National Institute for Standards and Technology using a new innovative technique.

Structure of Nuclei

- Using the high flux of gamma rays from the free election laser at Duke University, a determination will be made of the internal quark and gluon structure of nucleons and pions.
- By combining the use of special detectors and beams at the ORNL Radioactive Ion Beam facility, unique properties of unstable nuclei will be investigated.
- Funding in the amount of $850,000 has been budgeted for the SBIR program.

Facility Operations

- The ORNL Radioactive Ion Beam facility will deliver 2400 hours of radioactive beam for an experimental program and an actinide target will be developed in order to provide neutron rich Radioactive Ion Beams.
- Using newly developed beams at the ORNL Radioactive Ion Beam facility, crucial information about the nuclear force in special nuclei will become available.

Explanation of Funding Changes FY 1996 to FY 1997:

- The increase of $553,000 in the Astrophysics and Fundamental Interactions activities is due to a new program at Lawrence Livermore National Laboratory that utilizes the HERA array at LANSCE and new astrophysics research at ORNL's Radioactive Ion Beam facility and universities.

III. Performance Summary: LOW ENERGY NUCLEAR PHYSICS (Cont'd)

- The increase of $68,000 in the Structure of Nuclei activity is the result of an increase in RIB related research and a decrease due to the mothballing of the TRISTAN project at the High Flux Beam Reactor at BNL.
- The increase of $1,109,000 in the Facility Operations area includes increased costs for the full time operation of the ORNL Radioactive Ion Beam facility and increased responsibilities assigned to the National Nuclear Data Center at BNL.
- Overall FY 1997 funding for research and operation of university facilities supports an approximately continuing level of effort.

NUCLEAR THEORY
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

Theoretical Nuclear Physics is a program of fundamental science research to provide new insight into the observed behavior of atomic nuclei. The understanding of nuclear phenomena is prerequisite to understanding the material foundations of the world around us and in our universe. The research ranges from relating the description of elementary constituent particles and the fundamental forces connecting them, to descriptions of the nucleus as a whole. Theoretical models of the nucleus range from those that treat nucleons as maintaining their identities in orbits within the nucleus (shell models) to those that treat the nucleus as a coherent drop of nuclear fluid (collective models). The long-range objective of the Nuclear Theory subprogram is to obtain a comprehensive understanding of the character and structure of nuclear matter at the most fundamental level in terms of quarks and gluons. This objective is approached by interpreting results from nuclear physics experiments and by predicting new phenomena and relationships amenable to experimental tests. Nuclear theory research at universities and national laboratories entails individual efforts that transcend subcategories of nuclear physics. The selection of the elements of the nuclear theory program is based on the results of anonymous peer reviews by recognized experts in the international nuclear physics community. Much of nuclear theory requires extensive use of supercomputer capabilities and the development of innovative algorithms to use this advanced technology. The graduate students and post-docs supported in the Theoretical Nuclear Physics program are highly trained in technical problem solving techniques and have the flexibility to broadly enhance the nation's scientific and technical literacy. The strength of the nuclear theory effort is enhanced by strong interactions with the international nuclear physics community as well as by nuclear theory efforts supported by other agencies, such as the National Science Foundation. This is particularly true at the National Institute for Nuclear Physics in Seattle, increasingly recognized as a center of world leadership in nuclear theory. In many cases, directors of programs at the Institute come from outside the United States.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Nuclear Theory	$ 14,650	$ 14,820	$ 15,350	$+ 530	+ 3.6%
Total, Nuclear Theory	$ 14,650	$ 14,820	$ 15,350	$+ 530	+ 3.6%

III. Performance Summary:

FY 1995 Accomplishments:

- In FY 1995 theorists found a new way to apply the traditional nuclear shell model can be applied to a significantly expanded range of problems by using a Monte Carlo sampling technique.
- Significant progress was made this year towards the goal of understanding the structure of nucleons with the confirmation by computer studies that much of the character of the forces between quarks can be explained by special configurations of gluons.
- Theories have now been developed for describing collisions of heavy ions at all energies presently being studied experimentally, or that are planned for the future. The theories have been tested by comparison to experiment and found to agree well. The theories applicable to RHIC have now overcome initial conceptual difficulties and are ready to be applied.
- The Institute for Nuclear Theory at the University of Washington was fully staffed and conducted a successful program, acting as a focus center for the development of forefront research concepts.
- A higher quality theory program, better focused on the high priority areas of nuclear physics research, has resulted from the utilization of the findings of the panel review of the entire DOE Nuclear Physics research program conducted in FY 1994.

1312

FY 1996 Accomplishments (to date and planned):

- Significant progress will be made in extending the nuclear shell model to deal with nuclei under extreme conditions, such as those with large excesses of protons or neutrons. This is important for understanding nucleosynthesis, and will be the subject of experimental studies using radioactive beams at the Radioactive Ion Beam facility.
- Programs appropriate to ultrarelativistic collisions will be developed to predict the behavior of collisions between nuclei at the Relativistic Heavy Ion Collider.
- The Institute for Nuclear Theory at the University of Washington will conduct programs focussed on: Nuclear Structure Under Extreme Conditions, Quark and Gluon Structure of Nucleons and Nuclei, and Nucleosynthesis in the Big Bang, Stars and Supernovae.

III. Performance Summary: NUCLEAR THEORY (Cont'd)

FY 1997 Planned Accomplishments:

- The extension of the nuclear shell model to deal with nuclei under extreme conditions will be complete, and its predictions will be tested by results obtained in experiments using radioactive beams.
- The application of quark models to nucleons will yield accurate values for nuclear sizes and the strengths of their interactions.
- Theories appropriate to ultrarelativistic collisions will give detailed predictions of the results of collisions between nuclei at RHIC. These predictions will allow experiments to be refined to optimize the information that one can obtain about high density matter and the quark gluon plasma.
- The Institute for Nuclear Theory at the University of Washington will conduct programs focussed on: Ultrarelativistic Nuclei; From Nuclear Structure to the Quark-Gluon Plasma, and two on topics which have not yet been announced.

Explanation of Funding Changes FY 1996 to FY 1997:

- Overall FY 1997 funding for research and facility operations has increased by (3.6%), roughly the cost-of-living.
- $50,000 is provided for theoretical support of the MIT Bates facility.

RELATED CAPITAL FUNDING
(Tabular dollars in thousands, Narrative in whole dollars)

Mission Supporting Goals and Objectives:

The Related Capital Funding subprogram provides the necessary equipment that enables the Nuclear Physics program to maintain its vigorous pursuit of scientific opportunities. A major thrust of this subprogram is to provide large experimental devices which complement construction activities at the RHIC facility nearing completion at Brookhaven National Laboratory.

Capital Equipment funds provide for particle detection systems, for data acquisition and analysis systems, and for instrumentation to improve performance of Nuclear Physics accelerators. These funds are essential for effective utilization of the national accelerator facilities operated by the Nuclear Physics program. In addition, the program has landlord responsibility for providing general purpose capital equipment at the Lawrence Berkeley National Laboratory.

General Plant Projects (GPP) provides for minor new construction, for other capital alterations and additions, and for improvements to land, buildings, and utility systems. The Nuclear Physics program provides GPP funds for the Lawrence Berkeley National Laboratory as part of Nuclear Physics' landlord responsibilities for this laboratory.

Accelerator Improvement Projects (AIP) provide for additions, modifications, and improvements to major research accelerators and ancillary experimental facilities. These projects are necessary to maintain and improve the reliability and efficiency of operations, and to provide new experimental capabilities.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment	$ 28,000	$ 26,250	$ 26,500	$+ 250	+ 1.0%
General Plant Project	3,900	3,900	3,800	- 100	- 2.6%
Accelerator Improvement Projects	3,200	2,200*	5,400	+ 3,200	+ 145.5%
Total, Related Capital Funding	$ 35,100	$ 32,350	$ 35,700	$+ 3,350	+ 10.4%

* In FY 1996 a request will be made to reprogram $2,575,000 from AIP construction to Medium Energy Facility Operations ($2,200,000), and AIP operating ($375,000).

III. Performance Summary:

FY 1995 Accomplishments:

- At CEBAF, the very large superconducting toroidal magnet for the CEBAF Large Angle Spectrometer (CLAS) in Hall B was assembled and tested. Some detector components have been installed. A detector package for the High Resolution Spectrometer in Hall A was completed.

- AT BNL's Relativistic Heavy Ion Collider (RHIC), construction continued of the STAR detector's Silicon Vertex Tracker (SVT). This device adds unique capability for the study of strange particle production to the STAR detector. The Nuclear Science Advisory Committee (NSAC) viewed implementing the STAR SVT as having one of the highest priorities. The SVT has a Total Estimated Cost of $6.0 million in actual year dollars and was funded in FY 1995 at $350,000.

- At BNL's RHIC facility, instrumenting of the PHENIX detector's North muon arm continued. This device adds unique measurement capability for muon pair production over a wide kinematic range. NSAC judged that the muon arm was an essential part of PHENIX and thus should be built. The completion of the instrumentation package for the muon arm has a Total Estimated Cost of $11.4 million dollars and was funded in FY 1995 at $350,000.

- At BNL's AGS facility, experimental equipment needed to search for strange quark matter was assembled and the construction of a gold beam dibaryon search experiment was started.

III. Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

- At LBNL, Gammasphere was mounted in its final configuration, and approximately one-half of its 110 detectors were installed and brought into operation. Gammasphere is a world-class, high-resolution, high-granularity, high-efficiency array of gamma-ray detectors that is especially useful for studying nuclear structure at high angular momentum.

- At MIT/Bates, complete a variety of accelerator upgrade activities that improve beam availability.

- At ORNL, the target/ion source on the Radioactive Ion Beam (RIB) injector was completed and was used to accelerate ions through the tandem accelerator.

- In the 6800 ft deep underground site of the Sudbury (Ontario) Neutrino Observatory, the upper half of the 55-ft diameter photomultiplier (PMT) support frame was assembled, and 4700 10-inch diameter PMTs were mounted on the frame. Performance of the prototype neutron counters built from extremely low-radioactivity material was demonstrated and approved for fabrication.

- GPP funding was provided for minor new construction, other capital alterations and addition, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

- AIP funding supported additions and modifications to accelerator facilities that are supported by the Nuclear Physics research program.

FY 1996 Accomplishments (to date and planned)

- At CEBAF complete installation of all detector subsystems on the CLAS detector in Hall B. Complete detector installation and begin tune-up runs with the High Resolution Spectrometers in Hall A. Fabricate liquid hydrogen-deuterium target system for Hall A experiments. Begin major upgrade of the data reduction system to handle massive amounts of raw data.

- At BNL, continue constructing the STAR Silicon Vertex Traker detector with $1,100,000 provided in FY 1996. Final design and prototype tests of silicon drift wafers; begin fabrication of electronics.

III. Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

- At BNL, continue instrumenting the PHENIX North muon arm with $400,000 provided in FY 1996. Complete design and begin fabricating mechanical components of the muon identifier detectors, fabricate muon arm magnet coil.

- At BNL's National Synchrotron Light Source, begin mounting a program of experiments at the LEGS facility that will use a target of frozen heavy and light water.

- At LBNL, complete installation of the remaining detectors for Gammasphere and begin its full experimental program.

- At BNL, provide $1,000,000 to the RHIC construction project to acquire equipment that serves project operations and the experimental programs as part of the rebaselined profile.

- At MIT/Bates, continue installation of the Out-of-Plane Spectrometer (OOPS) and make improvements to the polarized injector.

- At ORNL's Radioactive Ion Beam facility, complete low-intensity commissioning studies and begin the research program. Two large experimental devices, the Recoil Mass Spectrometer and the Daresbury Recoil Separator will be ready for use.

- At the Sudbury Neutrino Observatory, complete assembly of the photomultiplier support frame and install the remaining 4700 photomultiplier tubes. Begin commissioning the data acquisition and analysis system. Complete fabrication of the neutron counters (800 m total length) and transport the counters underground for storage in the non-radioactive environment of the mine.

- GPP funding will be provided for minor new construction, other capital alterations and addition, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

- AIP funding supported additions and modifications to accelerator facilities that are supported by the Nuclear Physics research program.

III. Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

FY 1997 Planned Accomplishments:

- At CEBAF install ancillary equipment items, such as polarized targets, in experimental Hall A and C spectrometer systems. Continue major upgrade of data reduction system to handle massive amounts of raw data. Begin construction of second generation experiments such as spectrometer that is designed to investigate the strange quark content of the proton.

- At CEBAF, carry out improvements in accelerator, injector and cryogenic systems that allow simultaneous three hall operation.

- At BNL, continue constructing the Silicon Vertex Tracker with $2,000,000 planned in FY 1997. Continue fabrication of silicon drift wafers and electronics; begin mechanical assembly.

- At BNL, begin fabricating an electromagnetic calorimeter for the STAR detector. This device adds to the precision of measuring the particles emitted at large angles and thus provides unique information for the study of short-lived neutral reaction products.

- At BNL, continue instrumenting the PHENIX north muon arm at RHIC with $2,650,000 planned in FY 1997. Complete design and begin fabrication of wire-chamber tracking detectors for the muon arm.

- At BNL, provide $1,000,000 to the RHIC construction project to acquire equipment that serves project operations and the experimental programs.

- At ORNL's Radioactive Ion Beam facility, the research program will begin using the Recoil Mass Spectrometer (RMS) and the Daresbury Recoil Separator. A large, high-efficiency gamma-ray detector array for use in conjunction with the RMS will be completed.

- At ANL preparations will be made to install Gammasphere for an experimental program that uses the special properties of the ATLAS beam and the FMA recoil spectrometer.

- At MIT/Bates, upon review begin construction of apparatus needed to conduct a physics program using polarized internal targets in the South Hall Ring.

- At the Sudbury Neutrino Observatory, fill the detector with 1000 tons of heavy water and begin the research program of studying solar neutrinos. Test neutron counters and measure their internal background prior to deployment in the SNO detector.

III. Performance Summary: RELATED CAPITAL FUNDING (Cont'd)

- o GPP funding will be provided for minor new construction, other capital alterations and addition, and for buildings and utility systems. Funding of this type is essential for maintaining the productivity and usefulness of Department-owned facilities and in meeting its requirement for safe and reliable facilities operation. Since it is difficult to detail this type of project in advance, a continuing evaluation of requirements and priorities may result in additions, deletions, and changes in the currently planned projects. The total estimated cost of each project will not exceed $2,000,000.

- o AIP funding will support additions and modifications to accelerator facilities that are supported by the Nuclear Physics research program.

Explanation of Funding Changes FY 1996 to FY 1997:

- o An increase of $1,900,000 in AIP funds at CEBAF provides accelerator improvements that allow simultaneous three hall operation. An increase of $800,000 in AIP funds at MIT/Bates enables an upgrade of the linac RF transmitters. An increase of $400,000 allows construction of advanced ion sources at ANL and LBNL. An increase of $100,000 in AIP funding at other sites results from changes in programmatic priorities.

- o The small changes in Capital Equipment funding (+$250,000) and GPP funding (-$100,000) result from adjustments in these activities.

NUCLEAR PHYSICS

CONSTRUCTION
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

The Construction subprogram funds the necessary activities that enable the Nuclear Physics program to maintain a set of world-leading accelerator facilities that are essential for forefront scientific investigation. The major thrust is completion of the Relativistic Heavy Ion Collider (RHIC) facility and the start of its research program in FY 1999.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Construction					
CEBAF	$ 1,000	$ 0	$ 0	$ 0	0.0%
RHIC	70,000	65,000	65,000	0	0.0%
AIP	0	2,575*	0	- 2,575	- 100.0%
Total, Construction	$ 71,000	$ 67,575	$ 65,000	$- 2,575	- 3.8%

* In FY 1996 a request will be made to reprogram $2,575,000 from AIP construction to Medium Energy Facility Operations ($2,200,000), and AIP operating ($375,000).

1320

III. Performance Summary:

FY 1995 Accomplishments:

Construction

- o CEBAF construction was completed and accepted by DOE. The accelerator was commissioned, delivering the first five-pass 4 GeV beam in May 1995. Two large spectrometers and their detector systems are ready for experiments in Hall C. All eight very large (up to 500 ton) magnets for the High Resolution Spectrometers in Hall A have been mounted on their carriages.

- o RHIC collider construction continued with about 200 out of 360 large industrially produced superconducting dipole magnets now mounted on their stands in the ring tunnel. Final design of most other collider systems have been completed.

- o Construction of the RHIC STAR detector started with commercial fabrication of the coils and steel structure of the solenoidal magnet, construction of the STAR Assembly Building at the RHIC site, and production of Time Projection Chamber (TPC) components at LBNL.

- o Construction of the RHIC PHENIX detector started with fabrication of steel components nearly complete, and prototyping of detector subsystems taking place at 10 institutions.

1821

FY 1996 Accomplishments (to date and planned):

Construction

- o RHIC collider construction continues with all large dipole magnets for the arcs of the machine being mounted in the ring tunnel and interconnections begun. Beam tests of the injection beam line will be completed. Begin cooldown of ring in preparation for First Sextant Cooldown Test. Begin construction of long lead-time components of other collider systems.

- o Construction of the RHIC STAR detector continues with occupancy of the STAR Assembly Building, and Counting House. Continue production and assembly of detector subsystems and electronics.

- o Construction of RHIC PHENIX detector continues with installation of magnet components, and fabrication of detector subsystems and electronics.

III. Performance Summary: CONSTRUCTION (Cont'd)

- o AT CEBAF provide a redundant cold compressor to the central cryogenic facility in order to improve the reliability of accelerator operations.

FY 1997 Planned Accomplishments:

Construction

- o RHIC collider construction continues with the finish of all magnet production, with the mounting of magnets in ring tunnel, and with the completion of final design and construction of remaining collider systems.
- o Construction of RHIC STAR detector continues with testing of subsystems at LBNL, completion of assembly of all magnet and support structure, and completion of fabrication of electronics.
- o Construction of RHIC PHENIX detector continues with installation, testing and mapping of magnets. Start installation of detectors in central arm.

Explanation of Funding Changes FY 1996 to FY 1997:

- o No change in construction funding for RHIC.
- o The decrease of $2,575,000 is associated with no request of funds for AIP construction projects with TEC's in excess of $2,000,000.

2b. Construction Funded

SIGNIFICANT CHANGES

- TEC increased from $475,250,000 to $486,870,000 because of a directed change reducing FY 1996 Construction funding.
- TPC increased from $595,250,000 to $616,530,000 because of a directed change reducing FY 1996 Construction funding.
- Completion date of 2nd quarter FY 1999 changed to 3rd quarter FY 1999 because of a directed change reducing FY 1996 Construction funding.
- Funding Change:

  FY 1996 Construction funding was reduced from $70,000,000 to $65,000,000.
- Project Scope has not changed.

a/ Reflects the reduction of funds resulting from the FY 1991 sequester and general reduction.
b/ Application of a portion of the FY 1993 General Science and Research general reduction of $30,000,000 for use of prior year balances.

1. Title and location of project: Relativistic Heavy Ion Collider
Brookhaven National Laboratory
Upton, New York

2a. Project No. 91-G-300
2b. Construction Funded

8. Project Description, Justification and Scope

The FY 1996 Congressional Appropriation reduced construction funding from $70 million to $65 million. This reduction was partially offset by an additional $2.5 million in operating and $1 million in capital equipment funding. These funding actions result in a 3 month delay in the project completion date from the second quarter of FY 1999 to the third quarter of FY 1999 and increase the TEC and TPC. The TEC has increased from $475,250,000 to $486,870,000. The TPC has increased from $595,250,000 to $616,530,000. The increase in cost covers the support of core personnel essential for subsequent operations, stretch-out costs associated with revised work schedules to accommodate the funding profile, and escalation on the FY 1996 reduction, which is to be restored in FY 1999.

The Relativistic Heavy Ion Collider (RHIC) facility will be a unique, world-class research facility with opposing colliding beams that provides collision energies of 100 GeV/AMU per beam for heavy ions as massive as gold. RHIC will use the existing Alternating Gradient Synchrotron (AGS) and Tandem Van de Graaff complex as an injector. The new accelerator will be built in the existing Colliding Beam Accelerator (CBA) tunnel (3.8 km circumference), and will utilize the experimental halls, support building and liquid helium refrigerator from the partially completed CBA project.

The collider consists of two rings of superconducting magnets for accelerating and storing beams at variable energies up to 100 GeV/AMU for the heaviest ions. The collider will have the flexibility of using the full range of ion species from protons to gold which will be available from the AGS. With protons, energies of up to 250 GeV in each beam are expected. The capability for collisions between different masses in each ring will be provided. The collider is expected to have an average luminosity (a measure of the collision rate) of about 10^{26} cm^{-2} sec^{-1} for gold-on-gold collisions at full energy.

Most of the conventional construction for the collider exists, including a ring tunnel and an operating helium refrigeration system. The existing Collider Center (50,000 sq. ft. of usable area) will contain the accelerator control center, offices, technical shops, and refrigeration plant.

The existing tunnel configuration provides for six experimental areas where the circulating beams cross. Three of the experimental areas presently have completed experimental halls and support buildings for utilities. Another experimental area is an "open area" complete with support buildings and is suitable for experiments that use internal stationary targets. New construction is needed at two areas to close gaps in the ring. The standard tunnel cross section and support buildings will be constructed. Some general site work such as the paving of roads and the stabilization of the berm will also be provided.

1. Title and location of project: Relativistic Heavy Ion Collider Brookhaven National Laboratory Upton, New York	2a. Project No. 91-G-300 2b. Construction Funded

8. Project Decscribtion, Justification and Scope (Continued)

The funds requested will provide an initial complement of research detectors at beam intersection regions necessary for the first-round research program with the high-energy heavy-ion collider.

RHIC is a two-ring colliding beam accelerator dedicated to the study of nuclear matter at very high temperatures and densities where the quark-gluon degrees of freedom are expected to be directly revealed. The purpose of RHIC is to accelerate, store, and bring into collision two circular beams of very high energy heavy ions. For the heaviest ions (e.g., nuclei of gold atoms) the energies will range up to 100 GeV/AMU in each of the two colliding beams, providing a total collision energy which exceeds by more than an order of magnitude the capability of any other existing or proposed accelerator of heavy nuclear beams.

In such collisions experimenters will be able to study extended volumes of nuclear matter with energy densities greater than 10 times that of the nuclear ground state, achieving conditions of temperature and density at which this matter loses its identity as a collection of neutrons and protons and is predicted to undergo a phase transition to a plasma of quarks and gluons. This state of matter has not yet been observed. Its existence and properties are predicted by the theory of Quantum Chromodynamics (QCD), the theory of the strong interaction which has been developed over the past two decades of progress and discovery in high energy and nuclear physics.

At present the highest energy man-made heavy ion collisions are achieved with nuclear beams impinging on stationary targets, utilizing the Brookhaven AGS and CERN Super Proton Synchrotron accelerators. Recent experiments at these facilities have confirmed expectations that very energetic collisions produce increased densities and temperatures in nuclear matter. These experiments support the predictions that at much higher energies, which can be achieved only with the colliding beams of heavy ions at the RHIC facility, the most extreme temperatures and energy densities are produced in bursts of particles formed purely from the energy in the collision. These are the sought-for thermodynamic conditions which can be directly compared with QCD calculations, and which approximate the conditions that existed before the universe condensed from a plasma of quarks and gluons to a gas of hadrons.

RHIC is designed to meet the requirements for carrying out a wide-ranging program of experiments which will open up the heretofore unexplored physics of hot dense nuclear matter and to isolate and study the new states of matter thus created. These requirements are not met by any other existing or proposed high energy colliding beams facility, all of which are designed for the acceleration of light, singly-charged particles such as protons, antiprotons, or electrons.

10. Method of Performance

This type of construction project is a unique facility and therefore the design, assembly and testing will be done by the staff of the Brookhaven National Laboratory (with the assistance of an architectural-engineering (A-E) firm). Component parts, wherever possible, will be fabricated by industry under fixed-priced, competitively obtained, procurement actions. Some components may be fabricated in the existing shops at BNL. Building design will be on the basis of a negotiated A-E contract, and its construction will be by a competitively obtained lump-sum contract.

11. Schedule of Project Funding and Other Related Funding Requirements

a. Total project costs	Prior Years	FY 1991	FY 1992	FY 1993	FY 1994	FY 1995

Upton, New York

2a. Project No. 91-G-300
2b. Construction Funded

11. Schedule of Project Funding and Other Related Funding Requirements (Continued)

b. Related annual funding requirements (FY 1999 dollars)

1. Annual RHIC Facility Operating Costs	$49,400
2. Annual Injector Operating Costs	
AGS	19,300
Booster	3,200
Tandem	2,300
Total facility operating costs	$74,200
3. Annual plant and capital equipment costs related to facility operations	4,700
Total related annual funding *	$78,900

* Not all of these costs are incremental.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
1. Total facility costs
Explained in items 8, 9 and 10.

2. Other project costs
a. R&D necessary to complete construction

This included supporting R&D work on critical accelerator components before and during the construction phase. The funds covered the development of full-length (9.7 m) dipole magnets, quadrupole magnets, insertion magnets, and trim/correction spool pieces.

This also included R&D necessary for research detectors. Tests were needed to determine detailed parameters required for large-scale detectors for the heavy-ion experimental facilities, and a continued effort to develop new techniques of detection and read-out for improved utilization of the collider facility.

1330

1. Title and location of project: Relativistic Heavy Ion Collider
Brookhaven National Laboratory
Upton, New York

2a. Project No. 91-G-300
2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (Continued)

b. Related annual funding requirements (FY 1999 dollars)

These funds are needed for operation training of crew, early testing and check-out of various systems, as well as to establish a special process spares inventory as their construction is completed. Capital equipment is identified within other project costs for acquiring equipment to serve project operations and the experimental program. Portions of the cryogenic system and the beam injection system reached operational status in FY 1996.

b. Related annual costs (Estimated life of the facility: 20 years)

1. RHIC facility operating costs assume 38 weeks of operation with appropriate manpower, material, and support services associated with the research program. For this estimate, four experimental areas are assumed in use.

2. Injector operating costs assume that the Tandem/AGS injector complex is not being used for any function other than as the RHIC injector.

3. This item includes plant and capital equipment needed to maintain the research capability of the facility to evolving research requirements as well as funds for accelerator improvement projects and minor general plant projects required to ensure its continued high performance.

1331

GENERAL SCIENCE PROGRAM DIRECTION

PROGRAM MISSION

This program provides the Federal staffing resources and associated funding to plan, direct, and manage a viable, high quality national program of basic research in the fields of high energy physics and nuclear physics in support of the Nation's goals to support basic scientific research. It supports the staff in the Office of the Associate Director for High Energy and Nuclear Physics, the High Energy Physics Division, the Nuclear Physics Division, and associated program and management support staff in the Headquarters. This program also provides program-specific staffing resources at the Chicago, Oakland, and Oak Ridge Operations Offices to support high energy and nuclear physics activities carried out by those offices.

The Department of Energy provides over 90 percent of the Federal support, and serves as the Executive Agent, for the Nation's high energy physics program. Nearly 90 percent of the total Federal support of basic nuclear physics research is provided through the nuclear physics program. The staff develop program plans and budgets and execute approved programs. They support, plan, and provide for construction, maintenance, and operation of the large facilities on which research in high energy physics and nuclear physics depends. They oversee the operation of large and complex accelerator facilities which are used by qualified physicists throughout the Nation, provide technical oversight of the high energy physics and nuclear physics research programs at 15 major laboratories and well over one hundred universities throughout the Nation, and interact with other Federal agencies. In carrying out these responsibilities, the staff funded by General Science Program Direction assess the research and facility needs of these programs with the advice and assistance of the High Energy Physics Advisory Panel (HEPAP) and the DOE/NSF Nuclear Science Advisory Committee (NSAC), participate actively in their meetings, and provide program and administrative support for their operation. The staff work in close cooperation with the Oak Ridge Operations Office on Superconducting Super Collider (SSC) termination activities.

The staff also participate in cooperative programs with Japan, Germany, CERN Laboratory (Geneva, Switzerland) member countries, China, the former Soviet Union, Spain, Italy, France, The Netherlands, and Canada.

PROGRAM MISSION - GENERAL SCIENCES PROGRAM DIRECTION (Cont'd)

Program direction has been divided into five categories: salaries and benefits, travel, support services, Working Capital Fund and other related expenses. Support services refers to program direction funded support service contracts that provide necessary support functions to the Federal staff, such as computer systems development, training, technical support, mailroom, etc. Working Capital Fund costs include goods and services provided centrally by the Department at Headquarters. Other related expenses relates to other administrative costs of maintaining Federal staff, such as building and facility costs and utilities in the field and information technology expenses.

The goal of General Science Program Direction is to fund the management of programs which provide new insights into the nature of energy and matter to better understand our natural world.

The objectives related to these goals are: to utilize the peer review process for ongoing and proposed research activities and enhance international involvement and to champion the recommendations of the High Energy Physics Advisory Panel's "Future Vision Subpanel" as the new direction for high energy physics and the Long-Range Plan for Nuclear Science as updated by the Interagency Nuclear Science Advisory Committee (NSAC).

PERFORMANCE MEASURES:

Responsiveness to national science policy and initiatives.

Improvement in environment, safety and health compliance.

Provision of new and enhanced research facilities and equipment.

Increase in facility operating time.

Continued improvement in the utilization of staffing, travel and support contractor funds.

Expansion of international collaborative efforts.

PROGRAM MISSION - GENERAL SCIENCES PROGRAM DIRECTION (Cont'd)

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Continuing to manage almost the entire U.S. program in high energy and nuclear physics, including annual budgets of nearly $1 billion, with outstanding success and with relatively small staffing levels and program direction costs compared to research programs both within and outside the Department.
- Increased productivity at high energy and nuclear physics facilities as part of the FY 1996 Scientific Facilities Initiative.
- CEBAF became operational. Construction completed on schedule and within budget.
- International efforts increased with particular progress on Large Hadron Collider participation.
- Substantial progress on Main Injector, B-Factory and Relativistic Heavy Ion Collider construction.
- Sudbury Neutrino Observatory (SNO) Detector fabrication progressing, with completion and initiation of operations scheduled for FY 1997.
- Complete disposition of assets resulting from SSC termination.

a/ Working Capital Fund

I. Mission Supporting Goals Ongoing Responsibilities:

This program provides the Federal staffing resources and associated funding to plan, direct, and manage a viable, high quality national program of basic research in the fields of high energy physics and nuclear physics to ensure U.S. competitiveness in basic research. It supports the staff in the Office of the Associate Director for High Energy and Nuclear Physics, the High Energy Physics Division, the Nuclear Physics Division, and associated program and management support staff both in the Headquarters and at Chicago, Oakland, and Oak Ridge Operations Offices.

Beginning in FY 1997, program organizations are contributing to a Working Capital Fund to cover the costs of centrally provided goods and services such as supplies, housing, utilities, etc., which previously were budgeted in Departmental Administration. $1,200,000 has been included in FY 1997 request for General Sciences Program Direction for the Working Capital Fund. Appropriate amounts have been included in the FY 1995 and FY 1996 Comparable Appropriation columns to reflect this change.

1/ Excludes FTEs for terminating the Superconducting Super Collider (SSC) which are being funded from previous years' appropriations for the SSC.

III. Performance Summary: GENERAL SCIENCE PROGRAM DIRECTION

FY 1995 Accomplishments:

- o Provided personal compensation including salaries and personnel benefits, voluntary separation incentive payments, lump sum annual leave payments, travel, contractor support and other related expenses for 96 FTEs in the Office of High Energy and Nuclear Physics and related program and administrative support staff at Headquarters and the field.

- o The high energy physics staff provided continued program direction of the high energy physics program and of high energy physics accelerator centers at Fermilab, Stanford Linear Accelerator Center (SLAC) and Brookhaven National Laboratory (BNL).

- o Provided technical control and program direction for high energy physics research programs at nine major laboratories and managed more than 100 university research tasks to ensure the efficient operation and strong utilization of the large and complex high energy physics facilities and research capabilities.

- o Provided program direction of the Fermilab Main Injector and B-Factory projects.

- o Provided program direction of experimental and theoretical research and test-bed exploration of very promising new advanced accelerator concepts.

- o Maintained foreign liaison for conduct of experiments at foreign accelerators, and program direction of the L3 detector at CERN; and increased participation with CERN member countries on the Large Hadron Collider (LHC).

- o The nuclear physics staff provided technical program direction of the nuclear physics research programs at 12 national laboratories.

- o Managed more than 150 active Nuclear Physics grants and numerous research proposals and provided technical and project management direction including completion of CEBAF construction and preparation for operations.

- o Supported construction of the Relativistic Heavy Ion collider (RHIC) at BNL, including support of university participation in detector design and fabrication, and major equipment projects.

1340

III. Performance Summary: GENERAL SCIENCE PROGRAM DIRECTION (Cont'd)

- o Completed Gammasphere and continued work on the joint U.S./Canadian SNO detector.
- o Provided support to the Nuclear Theory Institute.
- o Provided support to ongoing R&D programs at university facilities and directed a significant university user experimental research program.
- o Managed the Nuclear Data program.
- o Provided program direction of international cooperative efforts in the nuclear physics program.
- o Provided additional direct program support at Chicago Operations Office, specifically at the Fermilab site and in support of RHIC at Brookhaven. Continued on-site support at the Stanford Linear Accelerator Center and CEBAF.
- o Provided environmental, safety, and health support for the high energy and nuclear physics accelerator facilities and completed the transfer of LAMPF to Defense Programs.
- o Continued to manage the disposition of SSC assets and worked closely with Oak Ridge Operations Office staff on SSC termination activities.

FY 1996 Accomplishments (to date and planned):

- o Provide personal compensation including salaries and personnel benefits, voluntary separation incentive payments, lump sum annual leave payments, travel, contractor support and other related expenses for 92 FTEs in the Office of High Energy and Nuclear Physics and related program and administrative support staff at Headquarters and the field.
- o Continue program direction of the High Energy Physics program including research and facility operations.
- o Continue contract management of physics research.

III. Performance Summary: GENERAL SCIENCE PROGRAM DIRECTION (Cont'd)

- o Continue program direction to ensure the safe management, efficient operation and strong utilization of the large and complex high energy and nuclear physics facilities and research capabilities.
- o Continue program direction of the Fermilab Main Injector and B-Factory projects.
- o Provide program direction of experimental and theoretical research carried out by university-based scientists and test-bed exploration of very promising new advanced accelerator concepts.
- o Maintain foreign collaborative programs for conduct of experiments at foreign accelerators, and program direction of the L3 detector.
- o Continue negotiations with CERN member countries leading to a formal agreement with CERN on the LHC and renew the agreements for cooperation with Russia and China.
- o Continue program direction of the nuclear physics program.
- o Provide program direction to the CEBAF laboratory and operation of the accelerator for research.
- o Support construction of the RHIC, including support of university participation in detector design and fabrication, and major equipment projects.
- o Continue fabrication of the Joint U.S./Canadian SNO detector.
- o Continue to support and provide program direction to the Nuclear Theory Institute.
- o Continue to support ongoing research and development programs at university facilities and direct a significant university user experimental research program.
- o Continue to manage the Nuclear Data program.
- o Continue program direction of international cooperative efforts in the Nuclear Physics program.

III. Performance Summary: GENERAL SCIENCE PROGRAM DIRECTION (Cont'd)

- o Continue environmental, safety, and health support for the high energy and nuclear physics facilities.
- o Continue on-site support at Fermilab, SLAC, RHIC and CEBAF.
- o Continue SSC termination activities and complete disposition of SSC assets.

FY 1997 Planned Accomplishments

- o Provide personnel compensation including salaries and personnel benefits, voluntary separation incentive payments, lump sum annual leave payments, travel, contractor support and other related expenses for 90 FTEs in the Office of High Energy and Nuclear Physics and related program and administrative support staff at Headquarters and the field.
- o Provide continued program direction of the high energy physics program.
- o Continue management and accountability for physics research projects.
- o Continue program direction to ensure the safe management, efficient operation and strong utilization of the large and complex high energy physics facilities and research capabilities.
- o Continue program direction of the Fermilab Main Injector and B-Factory projects, including preparing for FY 1998 B-Factory operation.
- o Provide program direction of experimental and theoretical research carried out by the university-based scientists and of test-bed exploration of very promising new advanced accelerator concepts and the Fermilab neutrino oscillation experiment.
- o Maintain collaboration with foreign partners for the conduct of experiments at foreign accelerators and program direction of the L3 detector; and increase participation with CERN member countries on the LHC. Renew the agreement for cooperation with Italy.

III. Performance Summary: GENERAL SCIENCE PROGRAM DIRECTION (Cont'd)

- o Provide continued program direction of the nuclear physics program.
- o Provide program direction to the CEBAF laboratory including operation of the accelerator for research.
- o Support construction of the RHIC, including support of university participation in detector design and fabrication, and major equipment projects.
- o Complete fabrication and installation of the SNO Detector and initiate operation.
- o Continue to support and provide program direction to the Nuclear Theory Institute.
- o Continue to manage the Nuclear Data program.
- o Continue program direction of international cooperative efforts in the nuclear physics program.
- o Continue environmental, safety, and health support for the high energy and nuclear physics facilities.
- o Continue on-site support at Fermilab, SLAC, CEBAF, and RHIC.
- o Complete most of the remaining SSC termination activities.

Explanation of funding changes FY 1996 to FY 1997:

The increase of $950,000 in FY 1997 is required to fund the staff and related costs associated with managing the High Energy Physics and Nuclear Physics programs, whose budgets increase in FY 1997. These programs are among the largest and most complicated from a scientific and technical and an administrative point of view, in the world. The increase in the FY 1997 request for General Sciences Program Direction is for increases for salaries and benefits, other related expenses and the Working Capital Fund, which are partially offset by decreases in travel and support services contract funds.

III. Performance Summary: GENERAL SCIENCE PROGRAM DIRECTION (Cont'd)

Explanation of Average FTE costs:

Average FTE costs vary from office to office, with Headquarters being higher than the field. The primary reason for this is that the Headquarters average includes charges for the Working Capital Fund for centrally provided goods and services. Also, Headquarters staff includes a high percentage of senior scientific program managers performing planning, policy and program management responsibilities, while the field offices, because of the nature of the program execution functions they perform, have a higher percentage of lower graded support personnel. Average FTE costs at the field offices at Chicago, Oakland and Oak Ridge are very similar.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
URANIUM SUPPLY AND ENRICHMENT ACTIVITIES

PROPOSED APPROPRIATION LANGUAGE

For expenses of the Department of Energy in connection with operating expenses; the purchase, construction, and acquisition of plant and capital equipment and other expenses incidental thereto necessary for uranium supply and enrichment activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101, et seq.) and the Energy Policy Act (Public Law 102-486, section 901), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion; purchase of electricity as necessary; and the purchase of passenger motor vehicles (not to exceed 3 for replacement only); [$64,197,000] $70,000,000, to remain available until expendended: Provided, That revenues received by the Department for uranium programs and estimated to total [$34,903,000] $42,200,000 in fiscal year [1996] 1997 shall be retained and used for the specific purpose of offsetting costs incurred by the Department for such activities notwithstanding the provisions of 31 U.S.C. 3302(b) and 42 U.S.C. 2296(b)(2): Provided further, That the sum herein appropriated shall be reduced as revenues are received during fiscal year [1996] 1997 appropriation from the General Fund estimated at not more than [$29,294,000] $27,800,000.

Explanation of Change

(1) Replacement vehicles required in FY 1997. None required in FY 1996.

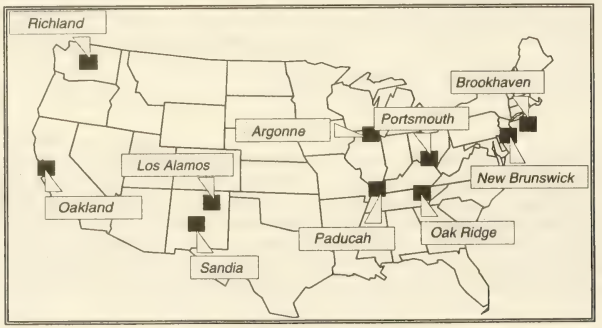
(2) Language clarifies source of funds.

1349

URANIUM PROGRAMS

PROGRAM MISSION

This program will provide expertise pertaining to uranium to address critical domestic and international nuclear issues, and advance U.S. competitiveness and security by providing nuclear products and services that meet the needs of the United States and the world community in a safe, environmentally-sound, and economical manner.



Uranium Programs Sites

1350

The GOALS of the Uranium Programs (UP) are to:

1. Cooperate and coordinate with other Departmental offices and government agencies in the implementation of U.S. nonproliferation policy.

2. Foster U.S. industrial competitiveness through technology transfer and increased exports of nuclear goods and services.

3. Manage Office of Nuclear Energy, Science and Technology (NE) facilities in a safe, economic, and environmentally-sound manner.

The OBJECTIVES related to these goals are:

1. Monitor the Russian processes involved in producing low enriched uranium (LEU) purchased from Russia to determine if the material is derived from highly enriched uranium (HEU).

2. Facilitate and increase commercial opportunities between U.S. nuclear suppliers and potential foreign buyers.

3. Facilitate commercial opportunities for U.S. nuclear fuel cycle participants.

4. Transfer derivative DOE-developed enrichment technologies to U.S. industry.

5. Identify and implement new opportunities for technology transfer.

6. Manage and dispose of NE's uranium and depleted uranium hexafluoride (DUF_6) inventories in a safe, economic, and environmentally-sound manner.

7. Help meet the Department's commitments to USEC.

PERFORMANCE MEASURES:

1. Reduce the HEU stockpile at the Portsmouth site by approximately 3 metric tons of uranium (MTU) in FY 1997 by blending it with LEU to produce reactor grade fuel.

2. Reduce the Departmental pre-existing liabilities (estimated to cost over $182,000,000) by $16,233,000 in FY 1997 by reimbursing the management and operating contractor and the power supplier for post-retirement life and medical costs for retirees who supported the Uranium Enrichment Program before July 1, 1993.

3. Correct or abate all safety-related deficiencies identified as potential near-term risks in Departmental facilities not leased to USEC.

PERFORMANCE MEASURES - continued:

4. Carry out up to eight special inspections in Russia to increase confidence that the LEU being purchased by the U.S. has been derived from HEU removed from dismantled Russian nuclear weapons, maintain a permanent presence office at Novouralsk, Russia, and establish a permanent presence office at Krasnoyarsk, Russia.

5. Complete 100 percent of the inspections on DUF_6 cylinders that are heavily oxidized and 33 percent of the remaining cylinder inventory.

6. Complete approximately 50 percent of the total required restacking effort in the DUF_6 management program. Approximately 12,000 cylinders will be restacked in FY 1997.

7. Complete cylinder skirt end cleaning and painting program.

8. Signed two Cooperative Research and Development Agreements (CRADA) with industry partnerships in FY 1995 and will sign a projected four CRADAs in FY 1996 and two in FY 1997 to transfer uranium technologies to result in new commercial market-oriented products and thereby benefit U.S. taxpayers and U.S. economic performance.

9. Prepare and submit an annual report concerning all Uranium Revitalization activities to the appropriate committees of Congress as required by the Energy Policy Act of 1992 (EPACT).

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- The Highly Enriched Uranium Equipment Shutdown activity reached the non-proliferation milestone of removing HEU from the operating facilities at the Portsmouth Gaseous Diffusion Plant in early FY 1996. Process facilities used for enriching the uranium-235 isotope during the last 40 years will have been cleaned to criticality-safe level. HEU materials stored in the cascade facility will be removed by the end of FY 1996.

- The Department signed a Memorandum of Agreement with USEC on December 15, 1994, that provides reimbursement procedures for activities of mutual concern, including the safety upgrades requirements in support of the USEC application for certification from NRC, and the refeeding of HEU from the weapons material inventory into the USEC enrichment operations.

- In FY 1995 and FY 1996, the Department will support USEC in transitioning from Department of Energy (DOE) regulatory requirements to the Nuclear Regulatory Commission Requirements for Certification. This includes preparation of a compliance plan for achieving NRC standards, to be submitted with the application for certification, as well as technical support in revising the operating safety requirements now in effect at the facilities, to technical safety requirements, that meet NRC operating conditions.

- The Department will implement detailed protocol agreements detailing procedures governing all aspects of monitoring visits and verification activities pursuant to the Russian down blending of HEU for shipment of LEU to the U.S. and provide assistance as appropriate to Russian monitors in the U.S..

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS: - continued

- This NE program supported the Secretary's response to the Chairman of the Defense Nuclear Facilities Safety Board (DNFSB) on June 29, 1995, that answers the DNFSB May 5, 1995, Recommendation 95-1 concerning improved safety of cylinders containing UF_6. An implementation plan was developed in consultation with the DNFSB and delivered on October 16, 1995.

- After nearly five years of activities to correct environmental noncompliances in the operating facilities at the two gaseous diffusion plants, corrective actions were completed in FY 1995 in all areas but one. The remaining activity, biological monitoring of water discharged from the Paducah facility, will continue as part of the permit requirements with the state of Kentucky.

I. Mission Supporting Goals and Objectives

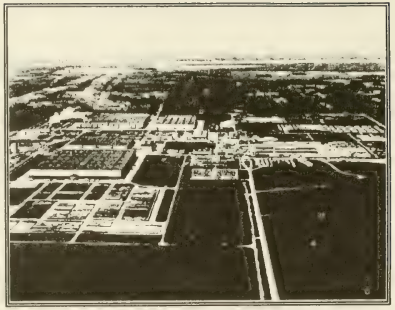
These activities are primarily focused on improving the United States' industrial competitiveness through two major sets of activities.

First, EPACT requires the Department to continue supporting USEC in a series of interdependent activities. These mutually dependent DOE/USEC activities are essential to the eventual success of USEC, a statute-driven example of reinventing Government through privatization initiatives. While privatization of USEC is expected to occur in FY 1996, Departmental involvement will continue long term.

NE is working with USEC to fulfill the Department's EPACT-mandated responsibilities and ensure that the Corporation's long-term value to the Treasury is maximized.

Specific efforts include: (1) regulatory oversight activities and a nuclear safety compliance program to ensure the continued safe and efficient operation of the gaseous diffusion plants; (2) DUF_6 management to provide an Environmental Impact Statement (EIS) to assess the long term disposition alternatives for the Department's inventory of DUF_6; (3) transparency measures to help build confidence that LEU being purchased by USEC has been derived from Russian HEU; (4) surveillance and maintenance of leased and non-leased facilities and the HEU safeguards and storage activities at Portsmouth; (5) the uranium revitalization initiatives designed to strengthen the domestic uranium industry; and (6) reimbursable work performed in support of USEC.

Second, NE is partnering with U.S. industry to capitalize on the $1,300,000,000 investment made in gaseous diffusion membrane and centrifuge technologies by the Department that can be used in other applications. This technology transfer effort offers great potential for a wide variety of businesses.



Depleted UF_6 Cylinder Storage Yards at Paducah
Yards cover about 40 acres and contain about 28,300 cylinders (60% of DOE inventory). The largest yard has over 1,000 cylinders lying on gravel; increasing corrosion rate. That yard, and others must be rebuilt to fix this problem.

1997

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Highly Enriched Uranium Equipment Shutdown and Inventory Disposition	$ 6,124	$ 5,005	$ 3,370	$ -1,635	-33
Nuclear Safety Compliance Corrective Actions	1,493	11,100	2,100	-9,000	-81
Maintenance of Leased and Non-Leased Facilities	16,539	13,140	11,734	-1,406	-11
Technology Partnerships	6,651	2,000	1,000	-1,000	-50

1358

III. Performance Summary:

FY 1995 Accomplishments:

- Highly Enriched Uranium Equipment Shutdown and Inventory Disposition
  - Completed HEU cell treatment program, this removes all HEU deposits in the cascade equipment that can be removed by a dedicated cell cleaning process.
  - Continued safeguards and security activity for HEU material.

- Nuclear Safety Compliance Corrective Actions
  - Submitted the DOE Compliance Plan to NRC in April 1995 in support of the NRC certification process for the leased gaseous diffusion plants.

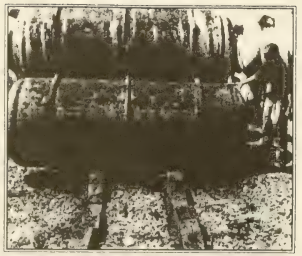
- Maintenance of Leased and Non-leased Facilities
  - Maintained grounds and roads including grass mowing, erosion and weed control, overgrowth management, patching and repair of 47 miles of gravel roads, 20 miles of fencing, and ditch maintenance.
  - Maintained polychlorinated biphenyl (PCB) troughing systems (over 32,000 troughs) in seven Paducah and Portsmouth process buildings leased to USEC, which involves routine inspections, repairs, waste containerization, spill clean-up and laboratory analysis.
  - Managed the storage and surveillance of uranium bearing materials in Building X-744-G.
  - Maintained non-leased facilities including general maintenance, building utilities, routine inspection and repairs.
  - Initiated contingency plan for the possible return of a gaseous diffusion plant by USEC.
  - Continued lease management and power procurement in support of USEC.

- Technology Partnerships
  - Laboratory scale demonstration activities were conducted on both membrane and advanced machinery technologies using Department developed enrichment technology in alternate commercial non-enrichment applications.
  - Two CRADAs using the results of the beneficial studies were signed in August 1995 with private industrial partners matching Federal funding and tasking for new commercial market oriented applications in non-uranium enrichment fields of use.
  - Additional commercial applications (over 40) and potential industry partners (over 30) were identified with potential for CRADA proposals in FY 1996 and FY 1997.
  - Four CRADAs using classified membrane technology were drafted with private industrial partner commitments of matching development funding and tasking; but CRADAs are placed on hold pending resolution of nonproliferation, national security and export control concerns.
  - Prepared new security standards for commercialization of technology.
  - The Department is actively investigating uses of the Department developed technology in non-enrichment fields of use with emphasis on cleanup and remediation of Department hazardous waste and toxin compounds, and removal of contaminates from industrial processes.

- Pre-existing Liabilities
  - Continued the payment of post-retirement life and medical benefits for Lockheed Martin and Ohio Valley Electric Corporation (OVEC) retired employees.
  - Continued litigation of legal actions attributable to operation of the uranium enrichment enterprise before the July 1, 1993, transfer to USEC.

FY 1995 Accomplishments - continued

- Transparency Measures
  - Conducted three monitoring training courses.
  - USEC placed an order for 186 MTU of Russian LEU derived from HEU that was delivered by the end of 1995.
  - National laboratory proposals for developing special monitoring equipment for use in the blending facility at Ural Electrochemical Integrated Enterprise (UEIE) were reviewed by an independent panel of experts.
  - Conducted the first familiarization visit to the Siberian Chemical Enterprise (SChE) plant at Tomsk, Russia, and the first monitoring trip to the UEIE plant at Novouralsk, Russia.
  - Completed draft annexes containing the detailed procedures governing all aspects of monitoring visits and transparency activities for use by the Transparency Review Committee (TRC).
  - Supported TRC meetings to negotiate and finalize where possible the annexes that govern monitoring procedures, including allowable reception and representation expenses.
  - Prepared Draft Safety Report and Security Report.
  - Provided assistance to USEC and the U.S. Fuel Fabricators for Russian visits to their facilities.



A Cylinder in Contact with Gravel at Paducah
Poor drainage means such cylinders are often in contact with water which can accelerate corrosion. The bottom portion of these cylinders cannot be inspected. As of October 1995, cylinders are no longer in ground contact.

- Depleted Uranium Hexafluoride Cylinders and Maintenance
  - Completed input to the Secretarial response to DNFSB Recommendation 95-1.
  - Submitted implementation plan to DNFSB Recommendation 95-1.
  - Inspected approximately 50 percent of the cylinders in inventory.
  - Restacked 2,600 cylinders at Portsmouth and Paducah to improve their inspectability, and removed 1,000 cylinders from ground contact at Paducah.
  - Cleaned 7,000 cylinder ends , painted over 1,700 cylinder ends.
  - Removed 7 cylinders at Oak Ridge from ground contact and moved 150 cylinders to improve their inspectability.
  - Conducted a series of public meetings at the three gaseous diffusion plant sites related to the long term strategy selection (EIS).
  - Completed independent technical review of public comments related to potential uses of depleted uranium and disposal options and issued Technology Assessment Report.

- Large Scale Classification Review
  - Completed preparation of large scale classification review plan and completed review of 120,949 pages of documents.

- Corrective Actions
  - Completed all planned corrective actions at the Portsmouth and Paducah Gaseous Diffusion Plants.

- Program Management Services
  - Provided support services for expertise not available internally for specialized areas, such as criticality analysis, environmental management, National Environmental Protection Act (NEPA) implementation, regulatory analysis, contingency planning, uranium market analysis, and health and safety issues.

FY 1995 Accomplishments: - continued

- Other Project Funding
  - Approved Conceptual Design Report to identify DUF_6 cylinder storage yards.

- General Plant Projects
  - Awarded a design-build contract for construction of office building at Paducah.
  - Completed Dykes Road improvements at Paducah.

- Capital Equipment
  - Purchased items of capital equipment required for UP and laboratory equipment for Technology Partnerships activities.

- Construction
  - Completed construction of S and E cylinder storage yards.

FY 1996 Accomplishments (to date and planned):

- Highly Enriched Uranium Equipment Shutdown and Inventory Disposition
  - Complete the disassembly and HEU decontamination of HEU cascade equipment.
  - Begin surveillance and maintenance of shutdown HEU cascade equipment in mid-FY 1996.
  - Renew shipment of HEU oxides to Y-12 upon startup of Y-12.
  - Continue safeguards and security activity for HEU material.

- Nuclear Safety Compliance Corrective Actions
  - Resubmit the DOE Compliance Plan to NRC in October 1995 in support of the NRC certification process for the leased gaseous diffusion plants.
  - Submit an annual update of the DOE Compliance Plan to NRC on the status of required nuclear safety upgrades.
  - Complete Safety Analysis Reports (SAR) for Paducah and Portsmouth Gaseous Diffusion Plant sites.
  - Complete transition from DOE to NRC regulatory oversight of the leased gaseous diffusion plants.

- Maintenance of Leased and Non-leased Facilities
  - Maintain grounds and roads including grass mowing, erosion and weed control, overgrowth management, patching and repair of 47 miles of gravel roads, 20 miles of fencing, and ditch maintenance.
  - Maintain PCB troughing systems (over 32,000 troughs) in seven Paducah and Portsmouth process buildings leased to USEC, which involves routine inspections, repairs, waste containerization, spill clean-up and laboratory analysis.
  - Manage the storage of uranium bearing materials in Building X-744-G.
  - Maintain non-leased facilities including general maintenance, building utilities, routine inspection and repairs.
  - Continue lease management and power procurement in support of USEC.

1361

FY 1996 Accomplishments (to date and planned): - continued

- Technology Partnerships
  - Studies of national security, non-proliferation and export control concerns continue regarding execution of Department developed classified membrane technology in commercial applications of non-enrichment fields of use
  - A number of private industrial partners (over 30) expressed interest in and a commitment to match Federal funding for CRADAs using Department developed enrichment technologies.
  - Industrial briefing on "Semiconductor Power and Conditioning Electronics" conducted at Oak Ridge November 9-10, 1995 with over 20 industrial firms attending and identifying potential additional CRADAs to develop current market oriented high value commercial products using Department developed technology.
  - Membrane and advanced machinery beneficial studies and laboratory testing are continuing that may result in additional CRADA proposals with private industrial partners matching Federal funding.
  - Four additional CRADAs are planned in FY 1996.

- Pre-existing Liabilities
  - Continue the payment of post-retirement life and medical benefits for Lockheed Martin and OVEC retired employees.
  - Continue litigation of legal actions attributable to operation of the uranium enrichment enterprise before the July 1, 1993, transfer to USEC.

- Transparency Measures
  - Conduct special monitoring trips to UEIE and SChE.
  - Conduct a familiarization visit to the Krasnoyarsk Electrochemical Plant at Krasnoyarsk, Russia.
  - Establish and maintain a continuous presence office at UEIE.
  - Develop and implement more effective transparency measures at the Russian facilities.
  - Support TRC meetings including allowable reception and representation expenses.
  - Provide oversight of Russian monitoring activities at U.S. facilities.
  - Provide assistance to U.S. facilities that will be subject to Russian monitoring activities.
  - Develop and deploy, as needed, special non-intrusive monitoring equipment.

- Depleted Uranium Hexafluoride Cylinders and Maintenance
  - Inspect about 27,000 cylinders.
  - Relocate and restack 12,000 cylinders.
  - Clean and paint 4,200 cylinder ends.
  - Paint 500 entire cylinders.
  - Remove 2,600 cylinders from ground contact at Paducah.
  - Complete engineering analysis in support of the long term strategy selection.
  - Publish Notice of Intent to prepare EIS for DUF_6.

- Large Scale Classification Review
  - Complete the review of about 110,000 pages of classified documents.

- Corrective Actions
  - Continue biological monitoring of stream discharges at the Paducah Gaseous Diffusion Plant site.

1362

FY 1996 Accomplishments (to date and planned): - continued

- Program Management Services
  - Provide support services for expertise not available internally for specialized areas, such as criticality analysis, environmental management, NEPA implementation, regulatory analysis, contingency planning, uranium market analysis, and health and safety issues.

- Other Project Funding
  - Completed NEPA-Environmental Assessment and NEPA-Categorical Exclusion for DUF_6 cylinder storage yards.

- Capital Equipment
  - Purchase items of capital equipment required for UP and laboratory equipment for Technology Partnerships activities.
  - Purchase additional capital equipment to test and demonstrate commercial prototypes using the Department developed technology.

- Construction
  - Complete construction of G cylinder storage yard.
  - Complete construction of roofing project at Portsmouth.

FY 1997 Planned Accomplishments:

- Highly Enriched Uranium Equipment Shutdown and Inventory Disposition
  - Continue surveillance and maintenance of shutdown HEU cascade equipment.
  - Complete shipments of HEU oxides to Y-12.
  - Continue to guard residual deposits remaining in the cascades as per agreement with the Office of Safeguards and Security.

- Nuclear Safety Compliance Corrective Actions
  - Submit an annual update of the DOE Compliance Plan to NRC on the status of required nuclear safety upgrades.

- Maintenance of Leased and Non-leased Facilities
  - Maintain grounds and roads including grass mowing, erosion and weed control, overgrowth management, patching and repair of 47 miles of gravel roads, 20 miles of fencing, and ditch maintenance.
  - Maintain PCB troughing systems (over 32,000 troughs) in seven Paducah and Portsmouth process buildings leased to USEC, which involves routine inspections, repairs, waste containerization, spill clean-up and laboratory analysis.
  - Manage the storage of uranium bearing materials in Building X-744-G.
  - Maintain non-leased facilities including general maintenance, building utilities, routine inspection and repairs.
  - Continue lease management and power procurement in support of the USEC.

FY 1997 Planned Accomplishments: - continued

- Technology Partnerships
  - Two additional CRADAs are planned in FY 1997 with private industrial partners matching Federal funding and tasks for non-uranium enrichment commercial applications that utilize Department developed membrane and advanced machinery technologies.
  - Resolution of non-proliferation, national security and export concerns and proceeding with declassification is planned; thereby, enabling Department developed technology to be utilized in commercial products through use of CRADAs and licensing agreements with private industrial firms matching Federal funding and development tasks.

- Pre-existing Liabilities
  - Continue the payment of post-retirement life and medical benefits for Lockheed Martin and OVEC retired employees.
  - Continue litigation of legal actions attributable to operation of the uranium enrichment enterprise before the July 1, 1993, transfer to USEC.

- Transparency Measures
  - Conduct special monitoring trips to UEIE, SChE, and Krasnoyarsk.
  - Maintain a continuous presence office at UEIE.
  - Establish a permanent presence office at Krasnoyarsk.
  - Develop and implement more effective transparency measures at the Russian facilities.
  - Support TRC meetings including allowable reception and representation expenses.
  - Provide oversight of Russian monitoring activities at U.S. facilities.
  - Provide assistance to U.S. facilities that will be subject to Russian monitoring activities.

- Depleted Uranium Hexafluoride Cylinders and Maintenance
  - Complete construction of T cylinder yard at Paducah.
  - Inspect about 27,000 cylinders.
  - Relocate and restack 12,000 cylinders.
  - Clean and paint 3,600 cylinder ends.
  - Clean and paint approximately 3,800 cylinder bodies.
  - Paint approximately 2,500 entire cylinders.
  - Complete engineering cost analysis in support of the long term strategy selection.
  - Issue draft EIS for DUF_6.

- Large Scale Classification Review
  - Complete the review of about 110,000 pages of classified documents.

- Corrective Actions
  - Continue biological monitoring of stream discharges at the Paducah Gaseous Diffusion Plant site.

- Program Management Services
  - Provide support services for expertise not available internally for specialized areas, such as criticality analysis, environmental management, NEPA implementation, regulatory analysis, contingency planning, uranium market analysis, and health and safety issues.

1364

FY 1997 Planned Accomplishments: - continued

- Capital Equipment
  - Purchase items of capital equipment required for UP.
  - Purchase four cylinder handlers and two portable cylinder painting facilities for Portsmouth and Oak Ridge Gaseous Diffusion Plant sites.

- Construction
  - Complete construction of T cylinder storage yard.

Explanation of Funding Changes FY 1996 to FY 1997:

Nuclear Safety Compliance Corrective Actions
- Less funding is required because the DOE site-wide SARs will be completed by the end of FY 1996.

Maintenance of Leased and Non-leased Facilities
- Less funding is required because the USEC Plant Turn Back Plan will be completed by the end of FY 1996 and because we are minimizing the maintenance activities related to the plant perimeter road system.

Technology Partnerships
- Funding for technology partnerships is decreasing due to Congressional budget cuts that result in reallocation of funding to other higher priority efforts.

Pre-existing Liabilities
- Post-retirement life and medical costs are increasing for the Lockheed Martin retirees because of inflation and because the number of retirees is projected to increase.

Transparency Measures
- The increase in funding for Transparency Measures from FY 1996 to FY 1997 is due to cost for conducting monitoring at an additional Russian facility.
- In FY 1997, Russia will deliver LEU from two Russian plants: UEIE and Krasnoyarsk. The U.S. plans to conduct monitoring at each site in FY 1997.

Depleted Uranium Hexafluoride Cylinders and Maintenance
- Significant acceleration is planned in cylinder maintenance activities. This acceleration is a result of a potential notice of violation settlement with the State of Ohio and to satisfy the Secretarial respondence to DNFSB Recommendations.

PROGRAM DIRECTION
(Dollars in Thousands)

I. Mission Supporting Goals/Ongoing Responsibilities

The Uranium Programs Program Direction account supports some Office of Nuclear Energy, Science and Technology personnel at Headquarters, some Operations Office personnel, and some employees of non-Department of Energy federal organizations that provide support for Uranium Programs activities. This activity also includes funding for administrative expenses, such as: training, computer support, including hardware and software acquisitions, modifications, and other telecommunications services for work stations.

III. Performance Summary

FY 1995 Measurable Performance Activities:

Completed second year of NE Headquarters streamlining and downsizing. Overall accomplishments (from FY 1993 baseline) which include all Program Direction activities are:

- Reducing Headquarters staff from 258 to 148 (41 percent reduction)
- Reducing the number of senior executive positions from 22 to 7 (68 percent reduction)
- Increasing employee to supervisor ratio from 2:1 to 10:1
- Reducing reliance on support service contracts by 38 percent
- Reducing the number of support service contractors occupying NE office space by 50 percent (from 24 to 12)

FY 1996 Measurable Performance Activities:

The key benchmarks by which NE will measure its FY 1996 streamlining performance are:

- Reducing Headquarters staff to 139
- Reducing senior executive positions to six
- Increasing the employee to supervisor ratio to 11:1
- Reducing travel by 20 percent from FY 1995 level
- Reducing reliance on support service contracts by 15 percent from FY 1995 level

1371

FY 1997 Measurable Performance Activities:

The key benchmarks by which NE will measure its FY 1997 streamlining performance are:

- Reducing Headquarters staff to 123 (a 52 percent reduction since 1993)
- Increasing the employee to supervisor ratio to 12:1
- Reducing senior executive positions to five
- Reducing reliance on support service contractors by 15 percent from FY 1995 level

IV. Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $659,000 is primarily due to increased support by the New Brunswick Laboratory associated with Transparency Measures activities as well as increased travel expenses due a full year of monitoring activities. All Transparency Measures travel is budgeted in the Headquarters account pending final selection of monitors for trips.

V. Explanation of Average FTE Costs:

The average employee costs are based on detailed calculations of employee salary costs (adjusted for escalation), benefits (life insurance, Medicare, and retirement), and other personnel compensation (such as awards and overtime). The average costs per employee does not include other expenses such as the working capital fund and travel, since this has been centrally budgeted for all NE Headquarters employees. The average employee costs are calculated using the end of year staffing level less the number of full time equivalents that are reimbursed by the United States Enrichment Corporation.

The overall average NE Headquarters employee salary and benefits cost is $95,000. The average NE Headquarters Uranium Programs employee salary and benefits cost is $93,000. The variance is negligible.

The overall average NE Field employee salary and benefits cost is $91,000. The average NE Field Uranium Programs employee salary and benefits cost is $85,000. The variance is due to lower grade employees at the field in the Uranium program.

1372

The average "fully loaded" employee costs are to include an allocation of expenses for rent, utilities, telecommunications, materials and supplies, etc., as well as salaries and benefits. These costs, for Headquarters and Field employees, are shown below:

Cost Category	Average per Headquarters Employee	Average per Field Employee
Salary and Benefits	95	91
Travel	7	5
Rent and Utilities	6	-
Contract Audits	3	-
ADP Support	3	-
Other Expenses	6	17
Total Average	120	113

- Does not include:

  -support services costs which are predominantly funded by program operating expenses;
  -travel by other federal agency employees (e.g., State Department travel related to transparency measures program activities);
  -other expenses not related to federal staffing (e.g., funding for New Brunswick Laboratory employees related to transparency measures monitoring activities in Russia); and
  -retirement "buyout" payments and related expenses.

URANIUM PROGRAMS OFFSETTING COLLECTIONS
(Dollars in Thousands)

I. Mission Supporting Goals and Objectives

This activity involves the sale of low enriched uranium (LEU) and natural uranium to partially offset residual uranium enrichment liabilities. LEU to be sold in FY 1996 was received during FY 1994 and will be received in FY 1996 as the result of an intergovernmental agreement. The natural uranium to be sold in FY 1997 is considered excess to the Department's needs. The Department is currently negotiating a sales and marketing agreement with the United States Enrichment Corporation (USEC) to market this material for the Department.

II. Funding Schedule

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Contract Sales	$ 0	$ -34,903	$ -42,200	$ -7,297	21
TOTAL, Uranium Programs Offsetting Collections	**$ 0**	**$ -34,903**	**$ -42,200**	**$ -7,297**	**21**

III. Performance Summary:

FY 1995 Accomplishments:

- Initiated negotiation of a sales and marketing agreement with USEC.
- Initiated work on an Environmental Assessment (EA).

FY 1996 Accomplishments (to date and planned):

- Complete EA.
- Receive LEU as the result of an intergovernmental agreement.
- Negotiate a sales and marketing agreement with USEC.
- Collect $34,903,000 from the sale of LEU received by the Department subsequent to July 1, 1993.

FY 1997 Planned Accomplishments:

- Collect $42,200,000 from the sale of natural uranium owned by the Department.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase in collections of $7,297,000 is due to the sale of more material and projected higher prices in FY 1997.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
CONSTRUCTION PROJECT DATA SHEETS
URANIUM PROGRAMS - PLANT AND CAPITAL EQUIPMENT
(Tabular dollars in thousands. Narrative material in whole dollars.)

1. Title and Location of Project: DUF6 cylinder storage yards, Paducah, Kentucky, gaseous diffusion plant

2b. Construction Funded

3a. Date A-E work initiated (Title I Design Start Schedule): 2nd Qtr. FY 1996

3b. A-E Work (Title I & II) Duration: 15 months

4a. Date Physical Construction Starts: 4th Qtr. FY 1996

4b. Date Construction Ends: 4th Qtr. FY 2000

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $0
Total Project Cost (TPC) -- $0

6. Current Estimate:
TEC $23,700
TPC $28,325

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1996	$ 3,000	$ 0	$ 3,000	$ 600
1997	4,000	0	4,000	6,000
1998	6,000	0	6,000	4,700
1999	8,000	0	8,000	8,700
2000	2,700	0	2,700	3,700

8. Project Description, Justification and Scope:

This project will provide the design and construction of a new depleted uranium hexafluoride (DUF6) cylinder storage yard of approximately 465,000 square feet, designated C-745-T, and the renovation of C-745-K, L, M, N, and P cylinder storage yards from gravel to concrete. This project will entail designing and constructing several reinforced concrete haul roads, updated and centrally powered lighting fixtures, improved drainage, and extension of the existing patrol road and security fence.

The mission of this project is to provide safe long-term storage of DUF6 cylinders until eventual disposition.

C-745-T yard is necessary due to the overcrowding of cylinders in existing Department of Energy (DOE) cylinder yards. Past practices of stacking cylinders in as tight a configuration as possible has led to several breaches due to lifting lug impingement and does not allow room for adequate visual inspection of cylinders. Current stacking requirements are designed to allow for better inspections and do not allow cylinder lifting lug impingement on adjacent side or top row cylinders. Additionally, C-745-T is large enough to allow relocation of all DOE cylinders from C-745-A, B, and C yards. C-745-A and B are leased to the United States Enrichment Corporation (USEC), and C-745-C is a very old yard, with cylinders stored in single rows on concrete pylons with wood chocks. It has poor-to-no drainage, and would be difficult to upgrade. Relocating these cylinders to C-745-T has the added benefit of having all DOE cylinders stored in the same central cylinder storage area on concrete saddles, and on new well-drained concrete yards. Due to space limitations for the temporary storage of cylinders in the yards being renovated, C-745-T must be constructed before any work can begin in C-745-K, L, M, N, or P yards.

1378

1. Title and Location of Project:	DUF6 cylinder storage yards, Paducah, Kentucky, gaseous diffusion plant	2a. Project No.: 96-U-201 2b Construction Funded

8. Project Description, Justification and Scope (Cont'd):

C-745-K, L, M, N, and P are newer gravel yards, some with improved drainage; however, cylinder handling traffic in these gravel yards continuously degrade them, destroys the drainage and allows the cylinder chocks to settle which put cylinders in contact with the ground and increases corrosion. The yards shall be constructed per the standard Paducah Gaseous Diffusion Plant (PGDP) 11 inch unreinforced concrete pad with adjacent and bisecting reinforced concrete haul roads for cylinder handling traffic.

The extensive storm water runoff drainage system will drain and collect all the rainwater from each of the yards into an existing retention/detention pond where it can be sampled and monitored before release to DOE-permitted outfall Kentucky Pollutant Discharge Elimination System (KPDES) 17. Currently, the cylinder yards do not drain well and often have standing water in them above the level of the cylinder bottoms after storms. Additionally, the current cylinder yards drain to five different outfalls of which only one is DOE permitted. The flows into outfall KPDES 17 should be directly attributable to the cylinder yards.

With the completion of these concrete yards, reinforced concrete haul roads, improved lighting and drainage the DOE DUF6 cylinders at PGDP will be in a stabilized condition for continued safe long-term storage.

9. Detail of Cost Estimate:

		Item Cost	Total Cost
a.	Design and Management Costs		$ 3,310
	1. Engineering design and inspection at approximately 3.3 percent of construction costs, Item c (Design, Drawing, and Specifications estimated at $272,000)	$ 552	
	2. Construction management costs at approximately 11.0 percent of Item c	1,806	
	3. Project management at approximately 5.8 percent of (Item c)	952	
b.	Land and land rights		0
c.	Construction costs		16,463
	1. Improvements to land	12,239	
	2. Buildings	0	
	3. Construction support	3,100	
	4. Utilities	1,124	
	5. Special facilities	0	
d.	Standard equipment		0
e.	Major computer items		0
f.	Removal cost less salvage		0
g.	Design and project liaison, testing checkout and acceptance		80
	Subtotal		19,853
h.	Contingencies at approximately 19.4 percent of above costs		3,847
I.	Total line item cost (Section 12. a 1. (a))		23,700
j.	Non-Federal Contribution		0
	Net Federal total estimated cost (TEC)		$ 23,700

1. Title and Location of Project:	DUF6 cylinder storage yards, Paducah, Kentucky, gaseous diffusion plant	2a. Project No.: 96-U-201 2b. Construction Funded	

10. Method of Performance:

DOE Oak Ridge Operations (OR) will manage the project, with the negotiate architect-engineer (A-E) contractor providing Title I and II site specific design and specific Title III as-built drawing support. The operating contractor will provide A-E support, project integration, site project management, and Title III inspection of construction. The construction manager and its fixed price subcontractors (FPSCs) will perform all major construction activities. The operating contractor will perform all process and utility tie-ins, and interfacing to the existing operations.

11. Schedule of Project Funding and Other Related Funding Requirements:

	Previous Years	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	Total

(g) Net Federal total project cost (TPC)	$ 170	$ 940	$ 6,000	$ 5,523	$ 9,523	$ 6,169	$28,325

1380

1. Title and Location of Project:	DUF6 cylinder storage yards, Paducah, Kentucky, gaseous diffusion plant	2a. Project No.: 96-U-201 2b. Construction Funded	

11. Schedule of Project Funding and Other Related Funding Requirements (Cont'd):

b. Related annual funding (estimated life of project--25 years)

1.	Facility operating costs	$ 150
2.	Facility maintenance and repair costs	0
3.	Programmatic operating expenses directly related to the facility	0
4.	Capital equipment not related to construction but related to the programmatic effort in the facility	25
5.	GPP or other construction related to the programmatic effort in the facility	0
6.	Utility costs	50
7.	Other costs	0
	Total related annual funding	$ 225

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements:

a. Total project costs

1. Total facility costs

(a) Line item (Section 10) -- Construction Line Item costs for engineering, procurement, and construction of DUF6 cylinder storage yards project are estimated to be $23,700,000.

(b) Expense funded equipment -- No narrative required.

(c) Inventories -- No narrative required.

2. Other project costs

(a) R&D necessary to complete project -- No narrative required.

(b) Conceptual design costs -- To identify a Uranium Programs DUF6 cylinder storage yard, project for PGDP, a Conceptual Design Report was approved by DOE in May 1995 for $120,000.

(c) Decontamination and Decommissioning (D&D) -- No narrative required.

(d) NEPA documentation costs -- The construction of C-745-T Cylinder Storage Yard is expected to require a NEPA-Environmental Assessment. Estimated cost is $150,000.

The renovation of C-745-K, L, N, and P are expected to require a NEPA-Categorical Exclusion. Estimated cost is $60,000.

1381

1. Title and Location of Project:	DUF6 cylinder storage yards, Paducah, Kentucky, gaseous diffusion plant	2a. Project No.: 96-U-201 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (Cont'd):

(e) Other project-related costs -- Value Engineering Studies, Safety Assessments, Quality Assurance Plan, Site Characterization, Geotechnical Survey, and other miscellaneous supporting and project documentation will be prepared for $180,000. The programmatic operating expenses directly related to the facility included incremental management required for the operation of the C-745-G UF6 Cylinder Storage Yard and the annual expenses of cylinder movement and restacking in these yards. The cylinder movement and restacking from C-745-A, B, and C to C-745-T, and the movement between C-745-T and C-745-K, L, M, N, and P is estimated at $823,000 per year for the first five years starting in 1998. After 2003, all DOE cylinders will be located in the proper new concrete yards and should be stacked correctly.

(f) Non-Federal contribution -- No narrative required.

b. Related annual funding

1. Facility operating costs --The estimated cost of opening C-745-G UF6 Cylinder Yard is minimal; however the storm water collection retention/detention pond will require periodic sampling, testing, and release of the rain water from the pond to KPDES outfall 17. This cost is estimated at $150,000 annually and should only require one employee periodically.

2. Facility maintenance and repair costs -- No narrative required.

3. Programmatic operating expenses directly relating to the facility -- No narrative required.

4. Capital equipment not related to construction but related to the programmatic effort in the facility -- Capital equipment purchases estimated at $25,000 for additional or upgraded UF6 trailers may be necessary to support the movement of cylinders from C-745-A, B, and C to C-745-T.

5. GPP or other construction related to the programmatic effort of the facility -- No narrative required.

6. Utility costs -- The cylinder yard will require electrical service estimated at $50,000 per year.

7. Other costs -- No narrative required.

13. Design and Construction of Federal Facilities:

All DOE facilities are designed and constructed in accordance with applicable public laws, executive orders, OMB circulars, Federal property management regulations, and DOE orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards," Section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960), and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6. The project will be located in an area not subject to flooding determined in accordance with Executive Order 11988.

1.	Title and Location of Project	DUF6 cylinder storage yards, Paducah, Kentucky, gaseous diffusion plant	2a. Project No.: 96-U-201 2b. Construction Funded

14. Supplemental Project Data for Facility Utilization:

a. Facility Utilization Requirements

b. Future Capabilities Assurance of this Project
Expansion Capabilities:
Capabilities for Change:
Decontamination or Retirement Features.

This project will be sited in accordance with the PGDP development and facilities utilization plan.

Isotope Production and Distribution

1384

OFFICE OF NUCLEAR ENERGY, SCIENCE AND TECHNOLOGY
ISOTOPE PRODUCTION AND DISTRIBUTION PROGRAM

PROGRAM MISSION

The Department, through the Isotope Production and Distribution (IP&D) program, provides radioactive and stable isotope products and associated services to a wide and varied domestic and international market. These products and services are produced, processed and provided using DOE facilities and scientific capabilities which exist to satisfy other Departmental research and production missions.

The IP&D program operates under a revolving fund and maintains financial continuity through its revenues and through payments from the Isotope Support decision unit, which is funded through Congressional appropriations. The IP&D program has two primary missions. The first mission is to produce and distribute certain low-volume radioisotopes and enriched stable isotopes for research and development, medical diagnoses and therapy, and other applications that are in the national interest. The second mission is to produce and distribute high-volume radioisotopes and enriched stable isotopes for medical, industrial, agricultural, and other useful applications on a business-like basis. In carrying out these missions, the Department will seek to divest from ventures that can be operated by the private sector at a reduced cost to the Government. The FY 1997 budget request under the Isotope Support decision unit is $12.7 million . This budget request combined with projected revenues of $11.0 million should provide the revolving fund sufficient funding to meet total estimated program expenses of $23.7 million.

The GOAL of the IP&D program is to:

Maintain financial viability to ensure a reliable supply of medical, research, and industrial isotopes consistent with customer needs.

The OBJECTIVES related to these goals are:

1. Manage production and distribution of selected isotopes reliably and cost effectively in coordination with other isotope producers.

2. Develop improved means of producing and separating isotopes.

3. Promote privatization of isotope production.

1885

PERFORMANCE MEASURES:

1. Developed and implemented a Five-Year Business Plan (FYBP) by the end of October 1995.

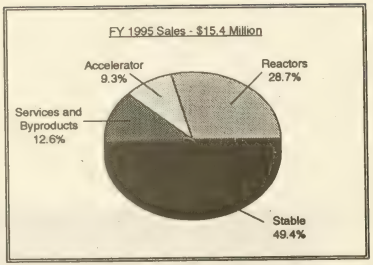
2. Determine whether to produce Mo-99 pending on-schedule completion of the Environmental Impact Statement.

3. Obtain Food and Drug Administration (FDA) approval for domestic Mo-99 production by mid-FY 1997, if initiative is pursued.

4. Prioritize and select process development projects by September 1997.

5. Attain gross profit of 14 percent by September 1997.

6. Achieve 95 percent on-time deliveries by September 1997.



Isotope Sales By Production Category

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- The ORNL calutrons will continue to operate and produce several stable isotopes used in medical applications as required to meet demand.
- Based on actual stable isotope sales in FY 1995, the IP&D program has regained over 45 percent of worldwide sales of stable isotopes and should continue this pace through FY 1996 and FY 1997.
- The IP&D program will continue to establish Cooperative Research and Development Agreements (CRADAs) or other appropriate agreements to supplement Departmental production of isotopes and related services. Two examples in FY 1995 were: Tin-117m used in bone cancer therapy and Yttrium-90 used in non-Hodgkins lymphoma therapy.
- An FYBP is currently being developed and will be issued in April 1996. The FYBP will serve as a formal corporate plan on how and what will be accomplished within available resources and will integrate the planning and budget cycles.
- The IP&D program will maintain financial viability through its revenues and the Isotope Support appropriation.
- The IP&D program will continue to provide hundreds of products and related services worldwide essential for medical, research, industrial, and agricultural applicants.
- Continued study of Mo-99 initiative, including environmental evaluation and process validation..

ISOTOPE PRODUCTION AND DISTRIBUTION PROGRAM
(Dollars in Thousands)

I. Mission Supporting Goals and Objective

The Department, through the IP&D program, provides radioactive and stable isotope products and associated services to a wide and varied domestic and international market. Ultimate applications of isotopes products include medical research and health care, industrial research and manufacturing, education, and national defense. The IP&D program has two primary missions. The first mission is to produce and distribute certain low-volume radioisotopes and enriched stable isotopes for research and development, medical diagnoses and therapy, and other applications that are in the national interest. The second mission is to produce and distribute high-volume radioisotopes and enriched stable isotopes that have profit potential for medical, industrial, and other useful applications on a business-like basis.

II. Funding Schedule

Sub-program	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	FY 1996 Real & Comp. Adjustments	FY 1996 Comparable Adjusted	FY 1997 Budget Request
Isotope Production & Distribution Program	$ 30,375	$ 34,158	$ 500	$ 34,658	$ 23,704
Less: Transfer from Isotope Support in Energy Supply R&D	-20,875	-24,658	0	-24,658	-12,704
Revenues from Sales	$ 9,500	$ 9,500	$ 500	$ 10,000	$ 11,000

III. Performance Summary

FY 1995 Accomplishments:

- Completed the environmental evaluation as part of the National Environmental Protection Act process for Mo-99 initiative.
- Restarted calutrons at Oak Ridge to provide essential medical and research isotopes.
- Executed five isotope CRADAs for advancing isotope production and processing techniques.
- Achieved gross profit of more than 10 percent.
- Increased revenues by 15 percent.
- Achieved 90 percent on-time deliveries.

1389

FY 1995 Accomplishments continued:

- Provided for continued study of Mo-99 initiative, including environmental evaluation and process validation.
- Maintained financial viability of the IP&D program through its revenues and the Isotope Support decision unit.
- Assured an adequate supply of isotopes to be used for medical diagnoses and therapy, other applications in the national interest, calutron operations to replenish inventories, and administrative activities.

FY 1996 Accomplishments (to date and planned):

- Determine whether to produce Mo-99, pending result of the Environmental Impact Statement.
- Achieve 95 percent on-time deliveries.
- Achieve gross profit of 12 percent.
- Increase overall revenues from isotope sales by 5 percent (if some DOE production facilities are privatized, DOE's share of revenues will decrease).
- Maintains financial viability of the IP&D program.
- Assures an adequate supply of isotopes to be used for medical diagnoses and therapy, other applications in the national interest, calutron operations to replenish inventories, and administrative activities.

FY 1997 Accomplishments:

- Obtain Food and Drug Administration (FDA) approval for domestic Mo-99 production, if initiative is pursued.
- Plan and fund prioritized process development projects.
- Achieve gross profit by 15 percent.
- Stabilize revenues.
- Continue calutron operations for the production of stable isotopes.

1390

FY 1997 Accomplishments: - continued

- Assures an adequate supply of isotopes to be used for medical diagnoses and therapy, other applications in the national interest, calutron operations to replenish inventories, and administrative activities.

Explanation of Funding Changes FY 1996 to FY 1997:

A total IP&D program reduction of $11,954,000 in FY 1997 reflects the decision to determine whether to fund Mo-99 within the overall DOE budget pending the conclusion of the Environmental Impact Statement during the Spring of 1996.

The revenue increase of $1,000,000 is due to the sale of stable isotopes including Helium-3.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
NUCLEAR WASTE DISPOSAL FUND

PROPOSED APPROPRIATION LANGUAGE

For nuclear waste disposal activities to carry out the purposes of Public Law 97-425, as amended, including the acquisition of real property or facility construction or expansion, [$151,600,000] $200,028,000 to remain available until expended, to be derived from the Nuclear Waste Fund, of which not to exceed $5,000,000 may be provided to the State of Nevada, solely for the conduct of its scientific oversight responsibilities pursuant to the Nuclear Waste Policy Act of 1982, (Public Law 97-425), as amended; and of which not to exceed $6,400,000 may be provided to affected local governments, as defined in Public Law 97-425, to conduct appropriate activities pursuant to the Act: *Provided further*, That the distribution of the funds herein provided among the affected units of local government shall be determined by the Department of Energy and made available to the State and affected units of local government by direct payment: *Provided further*, That within ninety days of the completion of each Federal fiscal year, each State or local entity shall provide certification to the Department of Energy, that all funds expended from such payments have been expended for activities as defined in Public Law 97-425. Failure to provide such certification shall cause such entity to be prohibited from any further funding provided for similar activities: *Provided further*, That none of the funds herein appropriated may be: (1) used directly or indirectly to influence legislative action on any matter pending before Congress or a State legislature or for lobbying activity as provided in section 18 U.S.C. 1913; (2) used for litigation expenses; or (3) used to support multistate efforts or other coalition building activities inconsistent with the restrictions contained in this Act.

1994

OFFICE OF CIVILIAN RADIOACTIVE WASTE MANAGEMENT

EXECUTIVE BUDGET SUMMARY

OVERVIEW

The mission of the Office of Civilian Radioactive Waste Management (OCRWM) is to manage and dispose of the Nation's spent nuclear fuel and high-level radioactive waste. The office provides leadership in developing and implementing strategies to accomplish this mission that assure public and worker health and safety, protect the environment, merit public confidence, and are economically viable.

To achieve our mission, the OCRWM Program has defined the following strategic goals:

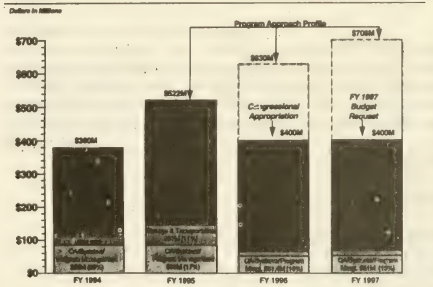
The Office was established by the Nuclear Waste Policy Act (NWPA) of 1982 to dispose of spent nuclear fuel and high-level radioactive waste from commercial and defense activities in a permanent geologic repository. The Nuclear Waste Policy Amendments Act (NWPAA) of 1987 designated the Yucca Mountain, Nevada site (Figure 1) for detailed scientific investigation to evaluate the site's suitability for a geologic repository. [The NWPAA also authorized the siting, construction, and operation of a Monitored Retrievable Storage (MRS) facility, subject to certain conditions.]

Figure 1: Progress being made at the Exploratory Studies Facility, North Portal. View from Exile Hill.

The OCRWM FY 1997 Congressional Budget Request of $400 million includes $200 million discretionary funding from the Defense Nuclear Waste Disposal Appropriation and $200 million discretionary funding from the Nuclear Waste Disposal Fund. The structure of the FY 1997 Congressional budget request has been significantly revised to reflect the Congressional program redirection mandated in the FY 1996 Energy and Water Development Appropriations Act.

The FY 1996 Energy and Water Development Appropriations Act provided a total of $400 million for the Program. However, $85 million of the total appropriation is reserved to be used for an interim storage facility and would become available for expenditure only upon enactment of new statutory authority. Funds to implement the current program are, therefore, effectively reduced to $315 million. The consequence is a 40% reduction from the FY 1995 level of expenditure ($522 million). Based on Congressional guidance, the Program has allocated $250 million of the available funds to preserve the core scientific work at the Yucca Mountain site.

Budget Distribution Comparison



The previous Program Approach which was the basis for the FY 1995 and FY 1996 budget request is no longer feasible. See budget chart left side, this page.

YUCCA MOUNTAIN SITE CHARACTERIZATION PROJECT

Consistent with the Program redirection, the mission at the Yucca Mountain site has been refocused to emphasize: Core Scientific Activity, Excavation of the Exploratory Tunnel (Figure 2), and Completion of the Repository and Waste Package Conceptual Design.

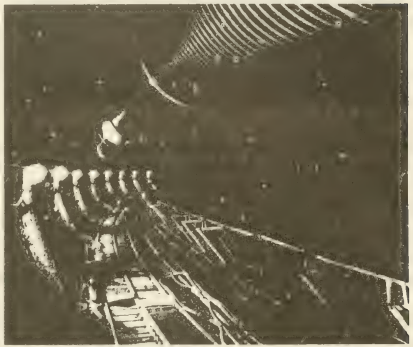


Figure 2: Photograph illustrating the progress of the Exploratory Tunnel nearly 2 miles into Yucca Mountain.

Figure 3: View of the mapping gantry on the Tunnel Boring Machine. Geologists can perform mapping and sampling tests while the machine is operating.

Prior to the recent appropriation action, the Program was on schedule to reach an early decision on the technical suitability of the Yucca Mountain site in the FY 1998 time frame and to meet the Program's other major milestones, including the submission of a license application in FY 2001, culminating in emplacement of spent nuclear fuel in a repository by 2010. See Figures 3-7. However, current and possible future funding constraints appear to have foreclosed this schedule. The $315 million appropriation in FY 1996 does not support the Program Approach. Instead, as directed by the Congress in the Conference Report, the Program plans to address the major unresolved technical questions regarding the conceptual design of the repository and its expected performance in a geologic setting.

Consistent with the guidance, the Program has defined a new deliverable for the Yucca Mountain Project which would take the form of a Viability Assessment. This package of deliverables would provide the requisite information for a determination in the FY 1998/FY 1999 time frame of the viability of continuing with the licensing of a geologic repository at the Yucca Mountain site. With appropriate policy and funding support, the license application target can be regained, but at a later date.

The Program has defined the following set of deliverables for the Viability Assessment which can be completed in the FY 1998/ FY 1999 time frame.

First, a package of more specific design work on the critical elements of the repository concept and the waste package that demonstrate that technologies are available to accomplish the objectives of geologic disposal. This will require resolution of critical unresolved issues in the waste isolation strategy, criticality control, and thermal loading;

Second, a total system performance assessment keyed to those design concepts, and based upon the analysis of the data available, which will describe the probable behavior of the repository;

Third, an estimate of the cost to construct and operate the repository;

Fourth, a plan and cost estimate for the remaining work required to complete a license application.

Activities that are deferred in FY 1996 include preparation of a license application to the Nuclear Regulatory Commission and environmental impact statement activities which support the Secretary's required site recommendation to the President.

Figure 4: The cutterhead of the "Alpine Miner" used in constructing test Alcove #2. Without interruption of the Tunnel Boring Machine operation, construction was completed ahead of schedule.

Figure 6: Drill rigs in place. Drilling data on rock quality and properties will be provided to tunnel designers and will support hydrologic models and tectonic studies.

Figure 5: A view of the Tunnel Boring Machine completing the 617 meter curve.

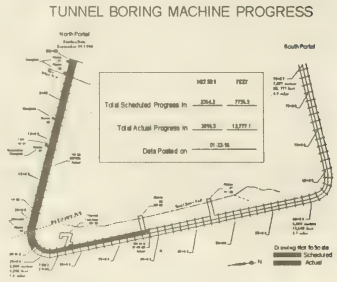

Figure 7: Progress of the Tunnel Boring Machine is being tracked on a daily basis. The machine is operating at near-commercial rates and is ahead of schedule.

WASTE ACCEPTANCE, STORAGE AND TRANSPORTATION

Waste Acceptance activities focus on plans for transferring waste to the Federal Government from the owners and generators of spent nuclear fuel and high-level radioactive waste. At the appropriate time, the Administration will request the release of the $85 million for generic interim storage activities. The FY 1997 activities will focus on planning for generic interim storage activities and for a national transportation capability.

PROGRAM INTEGRATION

Program Integration consists of activities and tasks that support all of the Program Element areas. Specifically, the Program Integration area includes the traditional areas of Quality Assurance, Program Management, Human Resources and Administration, and Federal Salaries.

ISSUES

Rationalize the Repository Licensing Approach

The Nation must revisit the regulatory structure that guides the licensing of the repository to reflect the experience of the past decade of work; the policy changes adopted since enactment of the Nuclear Waste Policy Act; and the realities of the budgetary constraints on the Program.

The current licensing approach is based upon conforming to Nuclear Regulatory Commission and Departmental regulations, which were promulgated prior to the 1987 Amendment to the Nuclear Waste Policy Act.

- The Departmental regulations involve making determinations about the physical characteristics of several candidate sites for the purpose of selecting the best prospect.

The Nuclear Waste Policy Amendments Act of 1987 directed the Program to consider only one site. Its physical aspects are only relevant if, and to the extent that, they affect the ability of that site to safely isolate wastes.

- The Program should determine a strategy for the containment and isolation of the waste to be emplaced in the repository; design a proposed repository; and provide the data to support a safety showing before the Nuclear Regulatory Commission for geologic disposal at the Yucca Mountain site should it be judged viable.

Interim Storage

An interim storage decision needs to consider the results of the Yucca Mountain Viability Assessment.

- The Administration has taken the position that any consideration of Nevada as an Interim Storage Facility should be deferred until the viability of Yucca Mountain as a repository site has been determined.

- The Viability Assessment for Yucca Mountain will be completed in the FY 1998/FY 1999 time frame.

Daniel A. Dreyfus, Director
Office of Civilian Radioactive Waste Management

OFFICE OF CIVILIAN RADIOACTIVE WASTE MANAGEMENT

PROGRAM MISSION

The mission of the Office of Civilian Radioactive Waste Management (OCRWM) is to manage and dispose of the Nation's spent nuclear fuel and high-level radioactive waste. The office provides leadership in developing and implementing strategies that assure public and worker health and safety, protect the environment, merit public confidence, and are economically viable.

The Office was established by the Nuclear Waste Policy Act (NWPA) of 1982, as amended, to dispose of spent nuclear fuel and high-level nuclear waste from commercial and defense activities in a permanent geologic repository. The Nuclear Waste Policy Amendments Act (NWPAA) of 1987 designated the Yucca Mountain, Nevada, site for detailed scientific investigation to evaluate the site's suitability for a geologic repository. The NWPAA also authorized the siting, construction, and operation of a Monitored Retrievable Storage (MRS) facility, subject to certain conditions.

Successfully implementing a strategy for accepting, managing, and disposing of our Nation's spent nuclear fuel has: Environmental, Non-Proliferation, International, Energy, and Equity implications for National Policy. The program serves the Nation's Environmental interests by pursuing a geologic site for the permanent disposal of high-level radioactive waste from the country's atomic weapons activities and commercial spent nuclear fuel. Providing an ultimate disposal site for commercial spent nuclear fuel will reduce the need for at-reactor storage which has been identified as a significant environmental concern. OCRWM's mission to provide for the direct disposal of spent nuclear fuel directly supports the Non-Proliferation strategy of the United States. The Federal government decided in the 1970s that reprocessing spent fuel to recover reusable plutonium was no longer a necessary part of the nuclear fuel cycle, and should be discouraged along with the commercial use of plutonium-based fuels because of the risks of nuclear proliferation. The Federal government made a commitment to provide for the direct disposal of spent fuel. Continuing with the effort to provide for the geologic disposal of spent nuclear fuel strengthens the country's ability to influence the commercial trade in plutonium by the international community. There is worldwide agreement to proceed with the development of geologic repositories by International community. If the United States were to abandon the pursuit of geologic disposal it could undermine the long-term waste management program of other nations. The mission of OCRWM directly supports the Energy interests of the United States by helping to ensure that the operation of nuclear reactors which supply approximately 20 percent of the nation's electricity is orderly and continuous. Successful execution of this mission will support the Equity arrangement intended by the original legislation funding approach which is designed to ensure that the costs of permanent disposal of spent nuclear fuel are borne by the beneficiaries of nuclear-generated electricity. Unless a sound program is aggressively pursued in the near-term, an open-ended financial obligation will be imposed on future taxpayers to finance the maintenance of storage facilities and, later, finance the development of a permanent disposal system.

In FY 1995, OCRWM completed a comprehensive program assessment. The assessment included input from Congress, the Administration, and Program Stakeholders. In response to this comprehensive assessment, OCRWM developed the Program Approach. The Program Approach identified three key components which are vital to successfully realizing the program mission. The key components were: focusing on early site suitability evaluation of Yucca Mountain by realigning our site characterization activities and supporting those activities with increased funding and staff; addressing the realities of near-term management of spent fuel by resolving the waste acceptance issue and defining the Department's role for near term storage; developing a Multi-Purpose Canister system that is integrated into all program elements. The Program Approach required that OCRWM restructure its previous plans, as reflected in the OCRWM FY 1996 Congressional budget request. The aggressive time line and comprehensive scope of the Program Approach assumed an increased future funding profile which was also contained in the FY 1996 budget request.

In the FY 1996 Energy and Water Development Appropriations, the level of funding provided to OCRWM was $315.0 million below the level requested to support the Program Approach. In addition, Congress mandated a program redirection. The structure of the FY 1997 budget request has been significantly revised to reflect the Congressional program redirection mandated in the FY 1996 Energy and Water Development Appropriations Act. The OCRWM FY 1997 Congressional budget request of $400 million includes $200 million discretionary funding from the Defense Nuclear Waste Disposal appropriation and $200 million discretionary funding from the Nuclear Waste Disposal Fund.

YUCCA MOUNTAIN SITE CHARACTERIZATION PROJECT

Consistent with the program redirection, the mission at the Yucca Mountain Nevada site has been refocused to emphasize: Core Scientific Activity, Excavation of the Exploratory Tunnel and Completion of the Repository and Waste Package Conceptual Design. Prior to the recent appropriations action, the Program was on schedule to reach an early decision on the technical suitability of the Yucca Mountain site in the FY 1998 time frame. The Program was also scheduled to meet other major milestones, including the submission of a license application in FY 2001, culminating in emplacement of spent nuclear fuel in a repository by 2010. The $315 million appropriation in FY 1996 does not support these activities. As directed by Congress in the FY 1996 Energy and Water Development Committee on Appropriations Conference Report, we now plan to continue addressing major unresolved technical questions regarding the conceptual design of the repository and its expected performance in a geologic setting.

Consistent with this guidance, we have defined a new deliverable for the Yucca Mountain Project which will take the form of a Viability Assessment. This package of deliverables would provide the requisite information for a determination in the FY 1998-1999 time frame of the viability of continuing toward the licensing of Yucca Mountain as a geologic repository.

The Program has defined the following set of deliverables for the Viability Assessment which can be completed in FY 1998-1999. First, a package of increased specific design work on the critical elements of the repository concept and the waste package that demonstrates that technologies are available to accomplish the objectives of geologic disposal, this will require resolution of critical unresolved issues in the waste isolation strategy, criticality control, and thermal loading; second, a total system performance assessment keyed to those design concepts, and based upon the analysis of the data available, which will describe the probable behavior of the repository; third, an estimate of the costs to construct and operate the repository; and fourth, a plan and cost estimate for the remaining work required to complete a license application.

Activities that are deferred in FY 1996 include preparation of a license application for submittal to the Nuclear Regulatory Commission and environmental impact statement activities both of which will eventually be required to support the Secretary's required site recommendation to the President.

WASTE ACCEPTANCE, STORAGE AND TRANSPORTATION

Waste Acceptance activities include those legal and institutional responsibilities related to the transfer of waste to the Federal Government from the owners and generators of spent nuclear fuel and high-level waste. In projecting past the FY 1997 budget requirements, the Department has assumed that the Congress and the Administration will arrive at a policy determination concerning interim storage upon completion of the Viability Assessment in the FY 1998-1999 timeframe. At the appropriate time, the Administration will request the release of the $85 million for generic interim storage activities. The FY 1997 activities will focus on planning for generic interim storage activities and for a national transportation capability.

PROGRAM INTEGRATION

Program Integration consists of activities and tasks that support all of the program element areas. Specifically, the Program Management and Integration element includes the traditional areas of Program Management, Quality Assurance, Human Resources and Administration, and Federal Salaries.

YUCCA MOUNTAIN SITE CHARACTERIZATION

I. Mission Supporting Goals and Objectives

The ultimate mission of the Yucca Mountain Site Characterization Program Element is to determine the suitability of the site to become a deep geologic repository for the nation's spent nuclear fuel and high-level defense nuclear waste; complete activities for a Presidential recommendation and license application submittal, and prepare the required Environmental Impact Statement (EIS).

The FY 1995 Program Plan, reflecting the revised Program Approach was developed to focus on only those tests and analysis critical to an early suitability evaluation and subsequent development of an EIS and license application. The major goals of the Program Approach were to (1) evaluate the Technical Site Suitability of the Yucca Mountain Site by the end of fiscal year (FY)1998; (2) develop a draft repository EIS and issue it for public comment by the end of FY 1999; (3) if the Yucca Mountain site appears suitable, deliver a Site Recommendation Report and a final EIS to the President by the end of FY 2000; and (4) if the President and Congress approve the site, submit a license application for repository construction to the Nuclear Regulatory Commission (NRC) in FY 2001.

The Program Element remains committed to the long-term objectives of site characterization and, if the site is suitable, completion of a docketable license application. In response to congressional redirection of this Program Element in the FY 1996 Energy and Water Appropriations Act, the near-term mission of this Program Element has been refocused to emphasize: core scientific activity; excavation of the Exploratory Tunnel; and completion of the repository and waste package conceptual design for later submission to the Nuclear Regulatory Commission. The near-term effort is on completion of a Viability Assessment, a major new deliverable. The purpose of the Viability Assessment is to provide sufficient scientific, financial and licensing data to demonstrate the practicability of continuing with an EIS and License Application. The contents of the Viability Assessment are: (1) a geologic repository (disposal system) design sufficient for evaluation of performance and costs of development; (2) total system performance assessment (TSPA); (3) schedule and cost estimates for completion of an EIS and License Application; and (4) An estimate of the costs to construct and operate the repository.

The focus of Viability Assessment activities in FY 1997 is to begin the development of a TSPA and a design of the repository and waste package in sufficient detail to evaluate the feasibility and performance of each. This will require resolution of critical unresolved issues in the waste isolation strategy, criticality control, and thermal loading. Continued development of site investigations synthesis reports and updated process models, the re-institution of repository EIS activities, and completing excavation of the Exploratory Studies Facility (ESF) main drift and providing the required test

data. The objectives for FY 1998 are to complete the TSPA and the Viability Assessment; start preliminary license application design for the repository and waste package; continue with the operations of the ESF; and conduct EIS activities and appropriate licensing application activities.

The activities supporting the accomplishment of the goals of the Program Element are: Operations/Construction, Core Science, Design and Engineering, Performance Assessment, Licensing/Suitability, National Environmental Policy Act (NEPA), Project Management, and Department of Energy Oversight, Payment Equal to Taxes (PETT), and Closeouts. The scope of these activities is described below. The repository EIS technical support and the technical support services contract will be awarded. Licensing/Suitability will be minimal in FY 1997 and will be coincident to the work funded in the other categories.

Operations/Construction:

Operations and construction includes coordination, planning, operation, and maintenance of the tunnel boring machine (TBM); construction of alcoves for scientific testing; instrumentation installation, operations and maintenance to acquire the test data necessary for the Viability Assessment, and surface and subsurface facilities related to the ESF and the drilling program. Also included is the safety and health program, which provides for the protection of employees, members of the public, and the environment; and field support services procured from the Nevada Test Site.

Core Science:

Core Science is comprised of field data collection from surface, subsurface, and drilling efforts; environmental and scientific data collection, monitoring, and requirements compliance; laboratory experiments; site and materials performance testing; scientific test planning and design; modeling and data and hypothesis analysis; input to and development of the Program Element technical data bases; completion of models and synthesis reports that serve as the basis for the geologic and hydrologic descriptions used in the Viability Assessment and future site recommendation, NEPA and licensing documentation.

Design and Engineering:

Design and Engineering includes coordination and planning of waste package and repository surface and subsurface and the balance of the ESF design; preparation and maintenance of design requirements documents and design control; integration and review; trade studies and cost estimates; performance testing; modeling programs for waste forms and waste packages; and quality assurance oversight and training. Also included are the optimization of repository design issues; transportation requirements and preparation and development of the repository and waste package input to the Viability Assessment and future site recommendation, NEPA and licensing documentation.

Performance Assessment:

Performance Assessment includes the calculations and modeling efforts associated with total system and subsystem performance analysis, for both the repository preclosure and postclosure periods. Performance assessment produces

evaluations of repository system behavior based on calculations and numeric modeling of physical processes and parameters affecting the potential migration of radionuclides through the geosphere. Performance assessment quantitatively evaluates the ability of the natural and engineered barrier systems to meet preclosure and postclosure performance objectives. Included is the management and control of the supporting technical databases and the coordination and planning for the Viability Assessment. Also included are interactions with the NRC, Nuclear Waste Technical Review Board (NWTRB), and other oversight groups.

Licensing/Suitability:

The objective of the licensing program is to prepare a license application for submittal to the NRC. The content and quality of the license application information should be such that the NRC would accept it for docketing upon submittal and be able to grant a construction authorization after the three-year review period mandated by the Nuclear Waste Policy Act, As Amended (NWPAA).

The overall objective of the site suitability program is to conduct site studies and perform analyses and evaluations necessary to enable the Director to reach findings for the qualifying and disqualifying conditions and, if the site appears to be suitable, develop a Site Recommendation Report. Specific objectives to achieve this goal are to provide demonstrable measures of technical progress toward developing a siting guidelines evaluation during site characterization.

NEPA:

NEPA compliance activities including the conduct of scoping meetings; reviewing and responding to public scoping comments; data gathering and impact analyses and; consultations with other agencies and Native American Indian tribes; all of which will lead to development and issuance of a DEIS. This would be followed by a similar set of activities after the public comment period on the DEIS. A final EIS, as well as a record of decision will be developed following the public scoping period. The DEIS will be issued in FY 1999 and the EIS will be issued in FY 2000. NEPA data needs will be integrated with data from core science, performance assessment, licensing and suitability.

Project Management:

Project Management includes the planning, budgeting, scheduling and funds management of all Program Element activities, facilities, site security, administrative support services, telecommunications and rents; records management and computer procurement, maintenance and operation wide area and local area networks; motor pool operations; and the conduct of a public information and outreach program. The major components of these activities are: management and integration functions for all approved work; Program Element control performance measurement system; technical Program Element management staff; and the cost and schedule baseline management.

External Oversight and Other:

This activity consists of financial and technical assistance to the State of Nevada, Affected Units of Government and Nevada state universities; National Academy of Science (NAS); PETT; and termination costs due to the downsizing of the Program Element.

II. **Funding Schedule**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change	FY 1998	FY 1999
Operations/Construction	$122,983	$ 84,719	$ 88,611	$+ 3,892	+ 05%	$ 88,268	$ 50,150
Core Science	102,309	53,667	71,076	+ 17,409	+ 32%	69,000	59,775
Design & Engineering	42,983	35,236	75,328	+ 40,092	+ 113%	74,732	62,421
Performance Assessment	22,737	12,144	19,263	+ 7,119	+ 59%	20,000	14,512
Licensing/Suitability	4,373	0	2,170	+ 2,170	+ 100%	4,000	4,545
NEPA	1,282	0	5,000	+ 5,000	+ 100%	6,000	4,400
Project Management	47,921	34,904	50,916	+ 16,012	+ 46%	42,000	32,197
External Oversight & Other	30,682	29,330	27,000	- 2,330	- 8%	26,000	22,000
Total Yucca Mtn Site	$375,270	$250,000	$339,364	$+ 89,364	+ 36%	$330,000	$250,000

NOTE:

1) Beginning in FY 1996, Environmental Data Collection activities were transferred to Core Science and Operations/Construction.

2) Partial funding for the Quality Assurance program is included in the Design and Engineering program activity. The supporting QA narrative is located in the Program Integration section.

III. **Performance Summary**

FY 1995 Accomplishments

Operations/Construction (FY 1995):

- In FY 1995, 2,002 meters of the ESF were excavated, of which 1,942 meters were excavated by the TBM. The ESF will give access to the geologic strata in which a repository will be placed. FY 1995 excavation was 720 meters more than planned at the beginning of FY 1995.

- Instruments were placed in 41 locations in the ESF to monitor the rock quality and any deformation induced by the excavation. The instruments showed very little displacement, validating our expectations that stable ground conditions and ground control is not a significant technical issue.

- Excavated test Alcoves #2 and #3 in the ESF to provide in situ locations for pneumatic and hydrologic testing of major geologic contacts and features.

- Completed five comprehensive environmental safety and health assessments and eight focused special issue assessments.

Core Science (FY 1995):

- Established a pneumatic monitoring network to collect baseline data on gas flow through Yucca Mountain and evaluate the impact of ESF construction on that gas flow. Preliminary results of pneumatic monitoring during TBM excavation into the Paintbrush nonwelded tuff were used to calibrate the Intermediate unsaturated zone (UZ) Hydrologic Framework Model.

- Completed line surveys in the ESF mapping through 1,800 meters. Data was collected on rock properties, fractures, and faults. The correlation between expected and "as built" geology was good. No unexpected features were encountered. The data was used as feed back to ESF designers, and to the flow and transport models of the unsaturated zone.

- Completed the phase I open-hole aquifer pump test at C-well complex. Phase I results provided draw-down, recharge curves for borehole C-3, and data on fracture flow and transmissivity. These results are important in describing fluid flow through the volcanic tuff as input to hydrologic flow models of the site.

- Completed pumping and testing at borehole WT-12. The tests provided data to determine hydraulic parameters for the site scale saturated zone model. This model will be used in ground water travel time calculations and serve as a basis for radionuclide transport models used in performance assessments.

- Completed drilling borehole SD-12 and nearly completed borehole SD-7. SD-7 and SD-12 are the only deep boreholes with Quality Assurance data in the central and southern repository area. Data on rock quality and rock properties will be provided to ESF and repository designers, and to the hydrologic models and tectonics studies.

- Collected 35 miles of high resolution gravity, magnetic, and seismic data in a grid over the Yucca Mountain area. Completed test lines over the proposed location of the ESF Ghost Dance fault alcoves. The data collected is fed into the Three dimensional (3-D) Geology Framework Model and contributes to the understanding of flow paths, and help characterize the steep hydraulic gradient at the north end of the Yucca Mountain.

- Completed data acquisition in UZ-16 using a 96 geophone string grouted in place. Collected data on compressional and shear velocity in 6 other boreholes. This data will be analyzed in FY 1996, to provide input to repository design, hydrologic flow, and transport models.

- Completed 23 miles of gravity, magnetic and seismic reflection profiles from Crater Flat to Jackass Flat. The data provided images of both shallow and deep structures, and was the first view of the subsurface area in the Crater Flat, west of Yucca Mountain. The three dimensional geometry is required for seismic hazard studies and evaluation of tectonic models.

- Completed a strategy for conducting thermal tests in the ESF. In situ heater tests will provide data essential to understanding the response of the host rock to heat generated by waste packages in a repository.

Design and Engineering (FY 1995):

- Completed the Multi-Purpose Canister (MPC) Systems Study. The study discussed the Yucca Mountain Site Characterization Program Element's strategy for accommodating the MPC into the design of the Mined Geologic Disposal System (MGDS), identified MGDS/MPC interface issues, developed a set of key decision points for resolution, and discussed requirements imposed on the MGDS by the MPC.

- Completed the Calico Hills Data Needs and Access Study that identified Calico Hills data needs and evaluated alternatives for accessing the Calico Hills geologic unit. This information will be used in deciding how best to assess potential Calico Hills performance as a barrier to radionuclide transport.

- Completed the FY 1995 Thermal Loading Study. The purpose of this study is to develop the technical basis for understanding the response of the rock to heat generated by waste packages in a repository, to support making a thermal loading decision for the repository.

- Completed engineering reports to optimize the proposed repository configuration. These included the Waste Package Emplacement Mode Evaluation Report, Repository Recommended Layout Concepts Report, As Low as Reasonably Achievable Analysis Update Report, Waste Handling Building Advanced Conceptual Design Report, and Preliminary Engineered Materials Characterization Report.

- Completed Nevada Repository Preliminary Transportation Strategy I and II Studies. The studies identified on the steps necessary to develop a system within Nevada to transport high-level radioactive waste entering the State for disposal at the potential repository site at Yucca Mountain, and provide information on existing conditions within the State that affect selection of a high-level waste transportation system. The information from the studies supports the design process and development of the DEIS for the proposed repository at Yucca Mountain.

Performance Assessment (FY 1995):

- Developed Total System Performance Assessment (TSPA) 1995 - an evaluation of the potential Yucca Mountain repository. TSPA quantifies the physical processes and interactions affecting the repository system. TSPA helps define the most significant processes, information gaps, uncertainties regarding these processes and additional information required in order to have a more robust assessment of the overall performance.

1412

- The focus of TSPA 1995 is on those components of the system that have been determined by previous analyses as most significant in the predicted containment and isolation of radioactive wastes from the biosphere. In particular, the focus is on the engineered components of the system and the near field environment in which these engineered components reside.

- Developed expected hydrologic cases for performance assessment. A key parameter in Yucca Mountain TSPA is the character and behavior of the ground water regime. The study established a set of reference hydrologic cases to be used in the execution of TSPA, and discussed the process of selection.

- Initiated development of an integrated radionuclide transport model from the near-field through credible pathways to the accessible environment. This model will be used to characterize physical, chemical, and hydrologic processes that enhance or retard the movement of radionuclides through the geosphere. The model will allow us to make quantitative predictions of radionuclide releases at the accessible environment for various release scenarios, and provide a basis for model abstractions by performance assessment.

Licensing/Suitability (FY 1995):

- Issue resolution activities were conducted between the DOE and the NRC to discuss methods to resolve technical issues identified by the DOE and NRC.

- Issued the first Technical Basis Report for Surface Characteristics, Preclosure Hydrology, and Erosion to the public and National Academy of Science (NAS); the NAS initiated their peer review of the Report.

- Provided the NRC with a new revision of the License Application Annotated Outline (LA AO) and Topical Reports I and II for Seismic Hazards Methodology. The benefits of early (pre-licensing) issue resolution using topical reports and the LA AO are reduced programmatic and regulatory risks. The DOE and NRC agreed to an annual revision and review cycle of the LA AO, provide an official update to the NRC on Program Element progress, identify continuing information needs for further development of the LA AO, and resolve identified technical and regulatory issues. The NRC reviewed the LA AO (Rev. 0) in FY 1995, and provided a preliminary evaluation report on the LA AO quality assurance chapter (Chapter 10). Based on these comments, a revised LA AO Chapter 10 will be developed in FY 1996 and submitted to the NRC as a complete resolved chapter.

- Completed and distributed the Office of Civilian Radioactive Waste Management (OCRWM) Process for Evaluating the Suitability of the Yucca Mountain Site for Development as a Repository for High-Level Waste and Spent Nuclear Fuel. The process identified a series of technical basis reports that summarize the current technical understanding of the site. The report was then provided to the NAS for review.

- Prepared and issued Semiannual Site Characterization Progress Reports 11 and 12, as required by the NWPA.

- Published and distributed the Phase II Licensing Support System (LSS) Functional Requirements Document, used as the basis for evaluating acquisition alternatives, subsequent LSS design and development.

NEPA (FY 1995):

- Published the EIS Notice of Intent (NOI) in the Federal Register announcing DOE's intent to initiate development of an EIS for a potential repository at Yucca Mountain and invite public comment.

- Held public scoping meetings in various cities to provide an opportunity for the public to comment on the scope of the EIS.

Project Management (FY 1995):

- Incorporated the Yucca Mountain Site Characterization Office (YMSCO) Five Year Plan into the OCRWM Program Plan for the revised program approach.

- Developed a detailed Program Element summary schedule for implementing the Program Approach for the suitability, licensing and NEPA products that further defined the scope, schedule, cost, and technical integration.

- Ensured Program Element activities were planned, funded, and scheduled to meet OCRWM program objectives; ensured Program Element activities were accomplished in accordance with approved workscopes, authorized budgets, and scheduled milestones; ensured Program Element participants were provided with facilities, equipment, systems, and support services needed to perform their approved activities; ensured Program Element participants were trained and qualified to perform their approved activities; ensured Program Element activities were performed in accordance with applicable statutes, regulations and DOE orders and directives; and ensured that open and informative interactions with the public and Program Element stakeholders were provided in accordance with the Nuclear Waste Policy Act as amended and the Secretary of Energy's customer service policy.

External Oversight and Other (FY 1995):

- Provided financial and technical assistance to the State of Nevada, Affected Units of Government and Nevada State universities; NAS; and PETT as consistent with the NWPAA. Provided termination costs due to downsizing the Program Element.

FY 1996 Planned Accomplishments

Operations/Construction (FY 1996):

- Continue excavation of the ESF with the TBM southward, through the repository horizon. From the ESF main drift, excavate a drift to explore the Ghost Dance fault and potential preferential pathway of water flow from the surface to the

1414

repository horizon. Excavate an alcove for conducting heater tests to determine thermal characteristics of the host rock. Excavate alcove #4 and initiate hydrologic testing in this alcove.

- Ensure the protection of employees, members of the public, the environment, and Program Element facilities and equipment from hazards that may result from site characterization and construction activities.

- Provide ESF underground safety support and on-site safety support to construction; provide environmental support for operating hazardous waste accumulation facilities, managing hydrocarbon contaminated soil maintenance and disposal; and conduct surveillance of site activities to ensure compliance with environmental regulations and requirements.

- Maintain medical emergency services and fire prevention programs to support field activities. Maintain and continue implementation of a safety and health program complying with applicable requirements. Continue implementation of the emergency management program.

Core Science (FY 1996):

- Complete initial testing in ESF Alcove 2: install equipment and initiate testing in Alcoves 3 and 4; continue unsaturated zone testing and monitoring in surface boreholes along the ESF main drift and north ramp; initiate Ghost Dance fault drift instrumentation and testing; begun the first ESF thermal test; and collect data in the saturated zone. This data will provide important inputs and constraints and site scale flow and transport models.

- Continue the probabilistic Seismic Hazard Analysis and the Probabilistic Volcanic Hazard Analysis.

- Perform data gathering and reporting of meteorological conditions to provide direct support to design, performance assessments, site suitability, environmental analyses and radiological dose assessments.

- Conduct ground-water monitoring and collect and compile data on ground-water levels and spring flows at approximately forty monitoring sites.

- Conduct scientific and engineering reviews of hazardous and solid waste handling and ESF facility designs to ensure compliance with environmental regulations and requirements.

- Perform preconstruction surveys to identify and characterize biological and cultural resources on lands proposed for surface-disturbing activities; perform interim and final reclamation activities as appropriate.

- Perform data gathering and reporting of ambient air monitoring data to the State of Nevada to meet the requirements of issued air quality operating permits so that uninterrupted surface disturbing activities may continue.

- Prepare data synthesis reports for radiological and terrestrial ecosystems field monitoring.

Design and Engineering (FY 1996):

- Complete the MGDS Advanced Conceptual Design (ACD). An MGDS ACD report will document the surface, subsurface, waste package, and rail spur conceptual designs. MGDS Viability Assessment design activities will be initiated. These activities will help substantiate the ACD design and its bases for the Viability Assessment. Materials and waste form testing will continue to refine the basis for models in support of TSPA.

- Continue developing the technical basis to support the thermal loading decision. The Thermal Loading Study will evaluate performance, cost, and schedule of the thermal management options. The study will also indicate how thermal loading flexibility can be achieved and when decisions must be made so that significant costs or schedule constraints are not incurred. The results of the study will be incorporated into the Program Element design technical baseline which directly supports the Viability Assessment design and engineering efforts.

- Conduct thermal management trade-off determination, design basis accidents/design basis events definition and evaluations, and backfill evaluation and determination.

- Complete a study to provide the technical basis for determination of a performance confirmation program. The Performance Confirmation Concepts Study will provide an overview of the performance confirmation approach in the form of a draft performance confirmation plan. The plan will include site characterization and pre-emplacement activities but will focus on post-emplacement monitoring. The results of the study will be incorporated into the Program Element design technical baseline which directly supports the investment analysis design and engineering efforts.

- Complete a study to provide the technical basis to support a recommendation regarding the use of backfill in the emplacement drifts. The Backfill Systems Study will provide a discussion of backfill design and cost considerations together with assessments of the impact of backfill on total system performance. Testing needs related to backfill effectiveness evaluations will be identified, as appropriate. The results of the study will be incorporated into the Program Element.

- Develop a design technical baseline which directly supports the Viability Assessment design and engineering efforts, and performance assessment.

- Continue to develop, establish, and maintain the Program Element cost and schedule and technical baseline; provide the MGDS input to the OCRWM program Total System Life Cycle Cost estimate; provide studies and analyses to resolve requirements, design, and/or testing issues; define, interpret and allocate engineering specialty requirements to produce a balanced design; and provide determination of importance evaluations and revisions as needed to support design and test package preparation.

Performance Assessment (FY 1996):

- The emphasis in FY 1996 will be on conducting sensitivity analyses of process-level models, model abstractions and total system and subsystem performance assessment analyses. These analyses will support the allocation of performance to the different barriers of the total system and will be used to identify the site and design-related information required to support a defensible performance assessment for the Viability Assessment.

- The Total System Performance Assessment-1995 and, where appropriate, Total System Performance Assessment-1993 analyses will be used as the basis for the new analyses.

- Various components of the waste package/engineered barrier system and near-field environment will be evaluated. These evaluations will consist of alternative properties and alternative conceptual model sensitivity studies.

- Components of the geosphere will be evaluated, including testing of the unsaturated zone transport model abstraction with the process model; site-scale alteration of the unsaturated zone flow caused by a range of thermal loads; alternative models for incorporating the effects of heterogeneity/spatial variability in the unsaturated zone; and alternative biospheres at alternative accessible environments.

- The credibility of system and subsystem level performance calculations rests on the credibility of the process level models that are the basis for this level of performance assessment modeling. The process level models may be used directly to provide boundary and input data, or they may be abstracted to become part of the higher level models. Recent performance assessment experience has shown that an additional level of detail is needed in the process level modeling. These models (e.g., site-scale unsaturated zone hydrology models, drift-scale thermohydrology models, waste package degradation models, waste package-scale thermochemical models (solubility), drift-scale transport models) will be provided by Yucca Mountain waste package and scientific programs groups to support the TSPA -- Viability Assessment and the overall Viability Assessment process.

- In the sensitivity analyses to be performed, interaction with appropriate site and design organizations will ensure that an appropriate range of alternative hypotheses is acknowledged, and if possible, tested. The sensitivity analysis will indicate which of the process models contribute most significantly to the overall performance and which should have priority in developing the Viability Assessment.

- Continue to conduct limited interactions regarding performance assessment with the NWTRB, Advisory Committee for Nuclear Waste, NRC, and the U.S. Environmental Protection Agency (EPA) regarding performance assessment. Although YMSCO considers interactions with each of these groups important, reduced funding requires YMSCO to focus on interactions most productive to Program Element progress.

- Continue interactions with the NRC on issue resolution and closure of site characterization analysis open items. Interactions will consist of informal meetings and formal technical exchanges, technical meetings, and management meetings. Support of NRC in-field verifications or vertical slice activities will be accommodated as funding allows.

Conduct issue resolution activities to gain NRC agreement and acceptance of DOE methods to resolve technical issues identified by the DOE and NRC, and reduce programmatic regulatory risk to the Program Element.

- A "Tiger Team" has been established to ensure that the Program Element's data acquisition investment efforts are protected from loss due to program downsizing. The team will identify data and records to be transferred to the Technical Data Base and the Records Processing Center. In addition, hardware, software, and test equipment, purchased with Program Element funds and resident at various participant locations, will be identified and transferred to the custody of the DOE.

- The development of a reasonable health and safety standard, called for by the Energy Policy Act of 1992, is imperative to the future of a licensable repository. YMSCO is planning interactions with the EPA to provide early guidance, review, and comment on the EPA's development of a proposed rule making for health and safety standards for Yucca Mountain, and to work with the NRC as they draft regulations to implement the EPA's standards.

- Continue development and production of the Semi-Annual Site Characterization Progress Report as required by the NWPAA.

- Erosion studies will be the basis for the development of a response package to resolve NRC comments on the Erosion Topical Report. A response package to NRC comments on the Seismic Hazards Methodology Topical Report I will also be developed to support issue resolution. Once NRC comments on the Seismic Hazards Methodology Topical Report II are received by the YMSCO, issue resolution activities will begin.

- Support database management tracking Program Element commitments to the NRC and open items with the NRC through completion or closure. Maintain a complete record of all commitments and open items and their dispositioning as necessary to support a future licensing process.

- Complete the expert elicitation process and develop the Probabilistic Volcanic Hazard Assessment Report (PVHA). The purpose of the PVHA expert judgement project is to assess the probability of a volcanic event (intrusive or extrusive) disrupting the potential repository at Yucca Mountain and to quantify the uncertainties associated with this assessment.

- Coordinate and develop the Viability Assessment Management Plan that defines the process and responsibilities for completing the deliverables required for an Viability Assessment and resulting in the development of the FY 1998 Viability Assessment Report. The Viability Assessment Management Plan will guide Program Element activities leading to an explanation of type of a repository viable at Yucca Mountain, its capacity, performance, design and costs.

- A comparison of the scope of FY 1996 site synthesis reports to Chapter 3 of the LA AO will be undertaken to identify outstanding information needs and determine necessary site characterization activities for sufficient completeness at licensing. Identification of remaining needs will ensure a significant section of the license application can be prepared in full.

1418

- The Waste Isolation and Containment Strategy (WICS) will be updated to include new data or information and new alternative interpretations since originally drafted. The WICS presents a strategy to evaluate Yucca Mountain for waste containment and isolation.

- Develop criteria and parameter validity tests for biosphere model selection.

Project Management (FY 1996):

- Ensure Program Element activities are planned, budgeted, and scheduled and funded to meet OCRWM program objectives; ensure Program Element activities are accomplished in accordance with approved workscopes, authorized budgets, and scheduled milestones; ensure Program Element participants are provided with facilities, equipment, systems, and support services needed to perform their approved activities; ensure Program Element participants are trained and qualified to perform their approved activities; ensure Program Element activities are performed in accordance with applicable statutes, regulations and DOE orders and directives; and ensure that open and informative interactions with the public and Program Element stakeholders are provided in accordance with the NWPAA and the Secretary of Energy's customer service policy.

External Oversight and Other (FY 1996):

- Provide financial and technical assistance to the State of Nevada, Affected Units of Government and Nevada State universities; NAS; and PETT as consistent with the NWPAA. Provide termination costs due to downsizing the Program Element.

FY 1997 Objectives

Consistent with the Program redirection, the main activities in FY 1997 will emphasize: core scientific activity, excavation of the Exploratory Tunnel, and completion of the repository and a waste package preliminary design for the Viability Assessment. In support of the Viability Assessment in FY 1998, our main objective for FY 1997 is to complete numerical models needed to support total system performance assessment. This suite of models will include process models describing flow of air and water, as well as transport of radionuclides in the unsaturated zone. Process models describing the flow of water and the transport of radionuclides in the saturated zone, at both the site and regional scales, will also be included. These models will provide the basis for calculations evaluating groundwater travel time and the potential for radionuclide migration through the geosphere to the accessible environment. Additional objectives are to produce synthesis reports which support the site description document and include conceptual models of geologic, hydrologic, geochemical, and geomechanical processes. The synthesis reports will summarize our knowledge gained from investigations identified in the Site Characterization Plan (SCP).

FY 1997 Planned Accomplishments

Operations/Construction (FY 1997):

- Complete the underground five mile ESF loop, second Ghost Dance fault alcove and, initiate hydrologic testing in this alcove. The completed loop will allow testing and evaluation of the geology and hydrology of the southern portion of the proposed repository.
- Initiate excavation of additional exploratory drifts..
- Construct a limited amount of facilities at the north and south portals to support the ESF construction and operations.
- Complete boreholes to provide data for the design of additional exploratory drifts and to improve our understanding of the distribution of rock units and faults in this area.
- Ensure the protection of Program Element employees, members of the public, the environment, and Program Element facilities and equipment from hazards that may result from site characterization and construction activities.
- Provide ESF underground safety support and on-site safety support to construction; provide environmental support for operating hazardous waste accumulation facilities, managing hydrocarbon contaminated soil maintenance and disposal, and conducting surveillance of site activities to ensure compliance with environmental regulations and requirements.
- Maintain medical emergency services and fire prevention programs to support field activities; maintain and continue implementation of safety and health program complying with applicable requirements. Continue implementation of the emergency management program.

Core Science (FY 1997):

- Continue testing in ESF Alcoves 2, 3, and 4; continue unsaturated zone testing and monitoring in surface boreholes along the ESF main drift, north ramp, and south ramp; continue Ghost Dance fault drift testing; and collect data in the saturated zone. This data will provide important inputs and constraints to site scale flow and transport models.
- Prepare numerical models to support total system performance assessment and refine our understanding of site geology and hydrology. Produce synthesis reports which support the Site Description Document that include conceptual models of geologic, hydrologic, geochemical, and geomechanical processes. The synthesis reports will summarize our knowledge gained from investigations identified and carried out under the Site Characterization Plan.
- Additional data collection activities will focus on gaining a better understanding of the repository's waste containment and isolation capabilities to support the Viability Assessment regarding infiltration potential, behavior of engineered barriers (e.g. waste package, backfill) and transport of radionuclides to the environment.

- Surface geophysic surveys will be conducted along E-W traverses across the repository block and along the south ramp of the ESF and north expansion areas to confirm the presence or absence of geologic structures not observed at the surface.
- Analyze additional water samples for isotopic tracers. Tracers will be used to assess the time required for groundwater to travel from the surface to its present location. This data will be used to constrain and evaluate flow models for the site.
- Drill boreholes to provide information on rock properties, deep stratigraphy and saturated zone to support three dimensional geologic, hydrologic, tectonic, and volcanism modeling efforts.
- Drill boreholes to sample and confirm the presence of potential buried basalt suggested by geophysics. Ages of buried basalt, if found, are required for volcanic hazard probability studies.
- Saturated hydrologic zone testing will be conducted to investigate water movement across faults; to complete tracer tests at the C-wells; and to study the deep aquifers downstream from the repository block.
- Collect otherwise irretrievable data, such as seismic, stream flow, pneumatic, and meteorological to record transient events such as earthquakes, floods, and major storms.
- Complete drill-hole WT-24 and conduct additional aquifer tests to characterize the steep hydraulic gradient and as input into the regional saturated zone hydrologic model.
- Continue geologic mapping along the main north-south drift, south ramp, and alcoves.
- Initiate hydrologic testing in the first Ghost Dance fault alcove to observe potential groundwater flow paths through the repository horizon. This will provide data crucial to the issue of fast flow paths through the unsaturated zone.
- Continue hydrologic testing in alcove #2 (Bow Ridge Fault), alcove #3 (upper contact PTn) and alcove #4 (lower contact PTn) to study water movement above the repository horizon. Initial data indicate that the PTn acts to buffer transient events, such as high fluid flux resulting from large storms. These tests will evaluate the magnitude and importance of this effect.
- Perform exploratory underground investigations in the proposed repository environment, including geologic mapping, and studies of water movement across faults.
- For thermal testing, continue testing the single element heater test. The drift scale heater test will be installed and heaters turned on during FY 1997. The drift scale heater test will be designed to approximate an actual emplacement drift. Thermal, hydrologic and geomechanical parameters will be monitored during the tests and data will be used to evaluate potential impacts on the near field environment.
- There will be ongoing design verification and construction monitoring to assess stability of ESF openings.

- Initiate testing in the ESF south ramp alcoves for hydrologic testing in the southern portion of the repository.

- Evaluate appropriate natural analogue sites, with a focus on specific processes related to radionuclide oxidation and transport.

- Improve environmental baseline data collection effort to support our understanding of the crosscutting disruptive processes such as climate change and other millennium events that might impact the Program's waste isolation and containment strategy.

- Perform data gathering and reporting of meteorological conditions to provide direct support to design, performance assessments, environmental analyses and radiological dose assessments. Meteorology inputs are also necessary to support the requirements of preclosure radiological safety, regional airflow patterns relative to population centers, and extreme weather conditions relevant to surface facility design.

- Conduct ground-water monitoring and collect and compile data on ground-water levels and spring flows at approximately forty monitoring sites.

- Conduct scientific and engineering reviews of hazardous and solid waste handling and ESF facility designs to ensure compliance with environmental regulations and requirements.

- Perform preconstruction surveys to identify and characterize biological and cultural resources on lands proposed for surface-disturbing activities; perform interim and final reclamation activities as appropriate.

- Perform data gathering and reporting of ambient air monitoring data to the State of Nevada to meet the requirements of issued air quality operating permits so that uninterrupted surface disturbing activities may continue.

- Complete data synthesis reports for radiological and terrestrial ecosystems field monitoring.

Design and Engineering (FY 1997):

- Produce a more comprehensive design to increase assurance of a cost-effective approach for disposing of the nation's radioactive waste while meeting an acceptable risk standard. This entails completing the preliminary design for the waste package, surface and subsurface designs of the repository, and the rail spur. Waste package enhancements will include work in fabrication development, criticality probabilistic analyses, materials, and waste form testing. Repository design enhancement will include investigation of the Nevada transportation, thermal layouts, shielding requirements, retrievability, backfill needs, ventilation, and equipment concepts.

- Complete the Thermal Loading System Study. The study will provide the technical basis to support the thermal loading decision. The study will evaluate performance, cost and schedule of the thermal management options. The study will also indicate how thermal loading flexibility can be achieved and when decisions must be made so that significant costs or

schedule constraints are not incurred. The results of the study will be incorporated into the Program Element design technical baseline which directly supports the investment analysis, design and engineering efforts.

- Continue to develop, establish, and maintain the Program Element cost and schedule and technical baseline; provide the MGDS input to the OCRWM program Total System Life Cycle Cost estimate; provide studies and analyses to resolve requirements, design, and/or testing issues; define, interpret and allocate engineering specialty requirements to produce a balanced design; and provide determination of importance evaluations and revisions as needed to support design and test package preparation.

Performance Assessment (FY 1997):

- The results of Total System Performance Assessment, including its technical peer review, will serve as the principal vehicle for integrating the products of the scientific, design, and engineering program elements, and as such constitutes a key component of the FY 1998 Viability Assessment. This total System Performance Assessment will begin in FY 1997. Technical peer review will assess supporting process models, abstracted performance assessment models, the TSPA itself, and the methods by which these components are integrated.

- The first TSPA activity module, Total System Performance Assessment Orientation will culminate in FY 1997, and activities associated with the second module, Process Model Review, will be initiated. During the Process Model Review activity DOE will demonstrate the relationships between the deterministic understanding of site processes and features, and the numerical process models that describe these processes and features. The approach will be adjusted, as necessary, reflecting review progress and the status of site and engineering input.

- The increased complexity of the process-models resulting from additional data collection activities supporting the FY 1998 Viability Assessment is to be integrated into performance assessment subsystem models. These data will be gathered to gain a better understanding of the repository's waste containment and isolation capabilities, and will be focused in areas of particular sensitivity as identified in TSPA 1993 and TSPA 1995. Primary among these sensitivities are infiltration potential, behavior of engineered barriers, and radionuclide transport to the accessible environment.

- Pertinent structural geologic, stratigraphic, and hydrogeologic data gained from the completed five-mile tunnel and additional data from surface boreholes incorporated into the detailed process-level models will, in turn, be incorporated into performance assessment subsystem models. Subsystem models will be further enhanced by incorporating process-level information gained from accelerated repository/waste package design and materials testing activities.

- Continue to conduct interactions with the NWTRB, Advisory Committee for Nuclear Waste, NRC, and the EPA. The interactions will be those determined to be most productive to the Project's progress.

- Develop a Performance Confirmation Plan to identify the short and long term tests and analyses needed to verify performance predictions.

- Continue development and production of the semi-annual Site Characterization Progress Report to the NRC and State of Nevada, as required by the NWPA.
- Continue maintenance of tracking databases tracking commitments to and open items from the NRC.
- Continue conducting regulatory reviews and issue resolution activities.
- Develop criteria and parameter validity tests for biosphere model selection and uncertainty analysis.

Licensing (FY 1997):

- Perform all activities necessary to screen, image, index and quality check images of records in preparation for Licensing Support Systems (LSS) submission. Tasks include elimination of the records backlog, reprocessing of the existing microfilm based records, and processing of incoming records packages.
- Initiate LSS acquisition activities.
- Design specification documents; conduct design reviews; and develop an Acceptance Test and System Turnover Plans; and proposal evaluation and award.

NEPA (FY 1997):

- The contract for a repository EIS technical support contractor will be awarded.
- Activities will include review scoping comments, categorize by issues/concerns, and prepare responses; draft description of proposed action and alternatives; and, analyze existing design performance assessment, and affected environment data for NEPA adequacy; gather additional data as necessary to support environmental analysis.

Project Management (FY 1997):

- Ensure Program Element activities are planned, funded, and scheduled to meet OCRWM program objectives; ensure Program Element activities are accomplished in accordance with approved workscopes, authorized budgets, and scheduled milestones; ensure Program Element participants are provided with facilities, equipment, systems, and support services needed to perform their approved activities; ensure Program Element participants are trained and qualified to perform their approved activities; ensure Program Element activities are performed in accordance with applicable statutes, regulations and DOE orders and directives; and ensure that open and informative interactions with the public and Program Element stakeholders are provided in accordance with the NWPAA and the Secretary of Energy's customer service policy. Ten million dollars is included for scoring a new lease due to the lease expiration of the current facility.

External Oversight and Other (FY 1997):

- Provide financial and technical assistance to the State of Nevada, Affected Units of Government and Nevada State universities; NAS; and PETT as consistent with the NWPAA. Provide termination costs due to downsizing the Program Element.

FY 1998 Objectives

Major work for FY 1998 is to complete the Viability Assessment, perform EIS and license application activities, and start preliminary license application design for repository and waste package.

FY 1998 Planned Accomplishments

Operations/Construction (FY 1998):

- Complete excavation of additional exploratory drifts.
- Provide for phased turnover of constructed ESF facilities to operations. Operations to include maintenance of facilities and utilities in support of continued testing and license applications.
- Demobilize the tunnel boring machine.
- Provide continued test support as required for test setup, additional alcove construction, and utilities.
- Ensure protection of Program Element employees, members of the public, the environment, and Program Element facilities and equipment from hazards that may result from site characterization and construction activities.
- Provide ESF underground safety support and on-site safety support to construction; provide environmental support for operating hazardous waste accumulation facilities; manage hydrocarbon contaminated soil maintenance and disposal; and conduct surveillance of site activities to ensure compliance with environmental regulations and requirements.
- Maintain medical emergency services and fire prevention programs to support field activities; maintain and continue implementation of safety and health program complying with applicable requirements. Continue implementation of the emergency management program.

Core Science (FY 1998):

- Complete the Site Description. A discussion will be provided of all data collected related to geology and hydrology. Complete full documentation of data sources and description of conceptual models of geologic and hydrologic processes operating at the site. Complete record packages will also be submitted.

- Performance confirmation data collection and testing will begin. These data will be used to fill information gaps or resolve uncertainties identified during the completion of the Site Description. The data will be used to update numerical and process models that will serve as the basis for the TSPA. These data collection activities will include:
  - complete single element heat up phase and begin cool down;
  - continue long duration drift scale heater and hydrologic tests;
  - hydrologic testing in the south ramp of the ESF;
  - complete SZ cross-hole testing in aquifer down gradient from Yucca Mountain; and
  - continue monitoring transient events such as earthquakes and large precipitation events.

- Perform data gathering and reporting of ambient air monitoring data to the State of Nevada to meet the requirements of issued air quality operating permits so that uninterrupted surface disturbing activities may continue.

- Perform data gathering and reporting of meteorological conditions to provide direct support to design, performance assessments, environmental analyses, and radiological dose assessments. Meteorology inputs are also necessary to support the requirements of preclosure radiological safety, regional meteorological data synthesis, regional meteorological conditions, regional airflow patterns relative to population centers, and extreme weather conditions relevant to surface facility design.

- Conduct ground-water monitoring and collect and compile data on ground-water levels and spring flows at approximately forty monitoring sites.

- Conduct scientific and engineering reviews of hazardous and solid waste handling and ESF facility designs to ensure compliance with environmental regulations and requirements.

- Perform preconstruction surveys to identify and characterize biological and cultural resources on lands proposed for surface-disturbing activities; perform interim and final reclamation activities as appropriate.

Design and Engineering (FY 1998):

- Start the license application design for the waste package, the surface and subsurface of the repository, to support the TSPA sensitivity and Total System Life Cycle Costs (TSLCC) products. The Waste Form Characteristics Report and Engineered Materials Characteristics Report will be updated to support the TSPA sensitivity analyses. Repository design will include surface and subsurface facilities descriptions and operations concepts to assess the viability of constructing and operating a repository at Yucca Mountain.

- Complete the design of a Waste Package Prototype to be used to verify that the design complies with regulations.

1426

Performance Assessment (FY 1998):

- The third TSPA-VA activity module, Abstract Model Review, will be conducted. During the Abstract Model Review activity, DOE will demonstrate the comparability between the results of the detailed process models and the abstracted models. Revisions to the approach identified in the Process Model Review will be documented, and technical assumptions and methods will be updated.

- Two key activities, the TSPA-VA Testing Process Level Model Abstraction - Phase 1 (Phase 1) and TSPA-VA Testing Process Level Model Abstraction - Phase 2 (Phase 2) supporting preparation of TSPA-VA will be performed.

  - Phase 1 will draw on process-level models developed in the site-characterization program and will abstract these models into a form used for the probabilistic TSPA analyses. In conjunction with these activities a representative biosphere will be developed and a dose model will be constructed for use in TSPA-VA.

  - Phase 2 will use abstracted models drawn from process-level models developed in the Analyses will be performed in accordance with applicable regulations. Results of the TSPA will feed Engineered Barrier System and Waste Package design.

- Design efforts and other design/engineering activities will provide guidance and recommendations to Scientific Programs. TSPA-type analyses will then be performed for the DEIS, ESF and design studies.

- The first in a series of activities supporting software qualification for TSPA, Saturated Zone Flow Software Qualification, will be initiated. Several codes are currently being used to model specific site processes and conditions, but a single code for each relevant process will be qualified for use in licensing. Selection of the appropriate code for qualification depends upon detailed comparison of the boundary conditions provided for the site scale saturated flow modeling. Verification of the code will include definition of a benchmarking problem, verification and comparisons of the numerical models.

- Provide uncertainty analysis and data input into biosphere model.

- The Viability Assessment will report the results of: site characterization studies; advanced designs for repository operation and waste package transport and emplacement; the ability of repository/waste package, acting as a total system, to isolate and contain radioactive waste; and estimate of the cost to construct and operate the repository.

Licensing (FY 1998):

- Initiate the acquisition of a Licensing Support System.

- Develop the Disposal Criticality Topical Report. This report will be based on the topical report annotated outline submitted to the NRC in FY 1995 and the comments received from the NRC on that outline.

- The evaluation of the LA AO Rev 0 against the key technical uncertainties and information needs started in FY 1997 will be completed. This evaluation will be used to focus development of the first preliminary LA chapters, or those areas where the most data exists.

- Complete the License Application Plan for the Viability Assessment, . This plan will identify the scope, schedule and cost of additional work required to produce a repository construction license application.

- Continue interactions with the NRC, NWTRB and other oversight groups.

- Continue LSS Acquisition activities including finalization of design and test documents; conduct of design reviews; issuance of procurement documents; LSS hardware/software maintenance; and procurement administration activities. Continue records processing activities.

NEPA (FY 1998):

- Prepare environmental impacts and consequence analysis for each technical discipline in the EIS. The preliminary impact analyses will consider results of a total system performance assessment of the repository. Preliminary drafts of the EIS on Impact Analyses and Environmental Consequences will then be developed and mitigation measures will be identified.

Project Management (FY 1998):

- Ensure Program Element activities are planned, funded, and scheduled to meet OCRWM program objectives; ensure Program Element activities are accomplished in accordance with approved workscopes, authorized budgets, and scheduled milestones; ensure Program Element participants are provided with facilities, equipment, systems, and support services needed to perform their approved activities; ensure Program Element participants are trained and qualified to perform their approved activities; ensure Program Element activities are performed in accordance with applicable statutes, regulations and DOE orders and directives; and ensure that open and informative interactions with the public and Program Element stakeholders are provided in accordance with the NWPAA and the Secretary of Energy's stakeholder policy.

External Oversight and Other (FY 1998):

Provide financial and technical assistance to the State of Nevada, Affected Units of Government and Nevada State universities; NAS; and PETT as consistent with the NWPAA. Provide termination costs due to downsizing the Program Element.

FY 1999 Objectives

Continue with licensing and EIS activities and complete preliminary license application design. Continue ESF operations for testing and complete and issue the DEIS and conduct public hearings.

FY 1999 Planned Accomplishments:

Operations/Construction (FY 1999):

- Provide continued test support as required for test setup, additional alcove construction and utilities.
- Continue phased turnover of constructed ESF facilities to operations. Operations include maintenance of facilities and utilities in support of continued testing and license application.
- Ensure protection of Program Element employees, members of the public, the environment, and Program Element facilities and equipment from hazards that may result from site characterization and construction activities.
- Provide ESF underground safety support and on-site safety support to construction; provide environmental support for operating hazardous waste accumulation facilities, managing hydrocarbon contaminated soil maintenance and disposal; and conduct surveillance of site activities to ensure compliance with environmental regulations and requirements.
- Maintain medical emergency services and fire prevention programs to support field activities; maintain and continue implementation of safety and health program complying with applicable requirements. Continue implementation of the emergency management program.

Core Science (FY 1999):

- Continue performance confirmation data collection and testing. These data collection activities will include:
  - complete single element heater test cooldown,
  - complete drift scale heater test heat up and begin cool down,
  - continue long term monitoring in the ESF and monitoring of transient events,
  - boreholes will be drilled to fill in areas of sparse information for numerical model updates for LA, and
  - continue to update numerical and process models of the site.
- Perform data gathering and reporting of ambient air monitoring data to the State of Nevada to meet the requirements of issued air quality operating permits so that uninterrupted surface disturbing activities may continue.
- Perform data gathering and reporting of meteorological conditions to provide direct support to design, performance assessments, site suitability, and radiological dose assessments. Meteorology inputs are also necessary to support the requirements of preclosure radiological safety, regional meteorological data synthesis, regional meteorological conditions, regional airflow patterns relative to population centers, and extreme weather conditions relevant to surface facility design.
- Conduct ground-water monitoring and collect and compile data on ground-water levels and spring flows at approximately forty monitoring sites.

1429

- Conduct scientific and engineering reviews of hazardous and solid waste handling and ESF facility designs to ensure compliance with environmental regulations and requirements.

- Perform preconstruction surveys to identify and characterize biological and cultural resources on lands proposed for surface-disturbing activities; perform interim and final reclamation activities as appropriate.

Design and Engineering (FY 1999):

- Continue the license application design with alternatives for the waste package, the surface and subsurface repository facilities, and the rail spur. Waste package activities will include design and long term waste form and materials testing for the models refinement and validation process. Repository activities will include the development of facilities design with alternatives and operations concepts to support the license application and NEPA processes.

- Complete the procurement and fabrication of the Waste Package Prototype.

Performance Assessment (FY 1999):

- The TSPA VA Review will be conducted. During the TSPA VA Review DOE will present the TSPA VA report to the Peer Review Panel and will describe the results. The Panel will catalog their impressions and make final formal information requests in a final letter report. The Panel will deliver to the DOE a report documenting the conduct and results of the peer review, including formal recommendations for changes in approach, methods, and scope for any future TSPA.

- The series of activities supporting software qualification for TSPA will be continued:
  - Unsaturated Zone Transport Software Qualification,
  - TSPA Software Qualification, and
  - EBS PA Software Qualification.

- Provide sensitivity analysis/quantification of final biosphere modeling inputs.

Licensing (FY 1999):

- Complete the Disposal Criticality Topical Report and issue it to the NRC for review and feedback.

- Prepare preliminary LA chapters for natural systems and Performance Assessment. Interact with the NRC staff to resolve issues.

- Prepare 10 CFR 960 compliance report.

- Prepare the Groundwater Travel Time PA description.

- Prepare portions of the draft license application.

- Complete the acquisition of the Licensing Support System. Initiate its installation and prepare for its acceptance testing by the NRC.

NEPA (FY 1999):

- Prepare preliminary DEIS for internal DOE review, incorporate changes, and prepare and publish the DEIS for public comment. The six month public comment period will be started. Public hearings on the DEIS will be held during the public comment period. Comment collection, categorization, and analysis will be initiated.

Project Management (FY 1999):

- Ensure Program Element activities are planned, funded, and scheduled to meet OCRWM program objectives; ensure Program Element activities are accomplished in accordance with approved workscopes, authorized budgets, and scheduled milestones; ensure Program Element participants are provided with facilities, equipment, systems, and support services needed to perform their approved activities; ensure Program Element participants are trained and qualified to perform their approved activities; ensure Program Element activities are performed in accordance with applicable statutes, regulations and DOE orders and directives; and ensure that open and informative interactions with the public and Program Element stakeholders are provided in accordance with the NWPAA and the Secretary of Energy's customer service policy.

External Oversight and Other (FY 1999):

Provide financial and technical assistance to the State of Nevada, Affected Units of Government and Nevada State universities; NAS; and PETT as consistent with the NWPAA. Provide termination costs due to downsizing the Program Element.

IV. Explanation of Funding Changes FY 1996 to FY 1997

The significant contributors to the FY 1997 budget increases are Operations/Construction ($84,719K-$86,611K) to allow for additional transverse drifting to improve Viability Assessment; Core Science ($53,667K - $71,076K) to perform saturated hydrologic zone testing, an increase in the number of alcoves requiring hydrologic and thermal testing, and testing requirements for the ESF south ramp. In addition, new surface based drilling and volcanic drilling programs will be initiated, and surface geophysics studies will be performed. Design and Engineering ($35,236K - $75,328K) increase is to produce an enhanced design for the waste package and repository, and to complete the Thermal Loading System Study. The design enhancements will increase assurance of a more cost-effective approach for nuclear waste disposal. The primary driver for the increase in Performance Assesment ($12,144 - $19,263K) is the preparation of the TSPA to support the Viability Assessment, and the addition of enhanced confirmatory modeling capability to increase the reliance of the

performance assessments and the predictive behavior of the proposed repository. Project management increased ($34,904K - $50,916K) to provide a comparable level of support for the increases in other areas of the program elements and to provide $10,000K for a scoring new lease due to the lease expiration of the current facility. Oversight, PETT, and closeouts decreased ($29,330K - $27,000K) due to reduced funding provided to the State of Nevada, affected units of local government, NAS and closeouts.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST

NUCLEAR WASTE ACTIVITIES
(Tabular dollars in thousands. Narrative material in whole dollars)

Yucca Mountain Site Characterization Project

IV. A. Operating Expense Funded Subproject Summary

Subproject No.	Subproject Title	Previous Obligations	FY 1996 Appropriated	FY 1997	Unappropriated Balance	TEC
83-W-100	Exploratory Studies Facility	$ 321,189	$ 65,960	$ 77,848	$ 210,276	$ 445,680

1433

IV. B. Operating Expense Funded Subproject Descriptive Summary

1. Project Title and Location: Subproject 83-W-100, Exploratory Studies Facility (ESF), Yucca Mountain, Nye County, Nevada — TEC: $445,680[b] TPC: $675,273

Physical Construction Start Date: 1st Qtr FY 1993 Completion Date: 2nd Qtr. FY 2000[a]

2. Financial Schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
Previous.....	$ 322,563	+ 1,141 c/	$ 321,183	$321,189
1996.....	65,960	- 1,147 d/		

a/ TPC is the current cost baseline approved by the Energy System Acquisition Advisory Board (ESAAB) in January, 1992, for the total Yucca Mountain Site Characterization Project work scope, which consists primarily of non-construction work for scientific investigations and License Application development.

b/ TEC has decreased $53,237,000 as a result of reduced construction relative to the Program Approach, due to reduced appropriations.

c/ Reflects use of prior-year balances during FY 1992 to support the completion of that portion of Title II design required for the start of site preparation in the first quarter of FY 1993, for the first access ramp portal.

d/ Budget authority transferred to other YMP program elements to fund ESF regulatory, repository/ESF interfaces and system studies, occupation and mined safety and health training.

1484

3. **Narrative:** The FY 1996 Congressional Budget submission identified a total estimated cost (TEC) of $498,918,000 in year-of-expenditure dollars for this subproject. Technical changes from the FY 1996 Congressional budget submission are due to four factors: 1) efficiencies brought about by having over 1 year's actual TBM operating experience; 2) increased integration of scientific investigators' needs to access the excavated areas and TBM excavation schedule, resulting in reduced TBM "down time"; 3) shifting away from single purpose alcoves and construction equipment and refuge niches; and 4) streamlining necessitated by significant reductions in FY 1996 appropriations and reduced outyear targets in this FY 1997 budget submittal.

The primary objective of this subproject is to collect and analyze data to be used in determining the suitability of the Yucca Mountain candidate site for the construction of a potential high-level nuclear waste repository. Construction, as defined in the Exploratory Studies Facility Design Requirements Document, will: (1) provide access to selected underground tuff horizons and surrounding strata in an unsaturated zone and perform in-situ testing in the selected horizons at the Yucca Mountain candidate site, and (2) provide the ability to safely and effectively acquire the necessary data for design of a potential repository, performance assessment, and license application.

The Exploratory Studies (ES) program will contribute to scientific investigation through extensive in-situ testing. This testing will assess geologic characteristics and characteristic variables; analyze the hydrologic properties to aid in evaluation of the isolation capability of the candidate tuff horizon; and determine whether the stability of openings can be maintained throughout the operational life of the potential repository without adversely affecting isolation capability or retrievability. At the conclusion of the ES program, and through the use of data obtained in other Yucca Mountain site investigation activities, data will be available to assess the suitability of the tuff at the site for use as a nuclear waste repository.

The budget authority level requested for FY 1997 will provide support to: complete excavation of the ESF 5 mile loop; complete excavation of the Heater Test Alcove and begin testing; excavate a second alcove off, the main drift, to access the Ghost Dance fault; complete design sufficient to initiate procurement of a subcontractor for further excavation; construct a limited number of additional surface facilities at the north and south portals; continue IDS procurement and installation. Continuing support activities include: test planning, coordination and provisions of construction support for testing; Title III engineering support for construction; project engineering and construction management; and transition of the ESF from the construction phase to the operations phase.

WASTE ACCEPTANCE, STORAGE AND TRANSPORTATION

I. **Mission Supporting Goals and Objectives**

The Waste Acceptance, Storage and Transportation (WAST) Program Element will address the long-lead time activities that must precede any near term removal of spent nuclear fuel (SNF) from reactor sites once a federal facility becomes available. This includes an evaluation of alternatives for creating a private-sector, market-driven, national transportation capability to remov[illegible], including canisters, transport casks and storage module production, and waste acceptance and transportation services. Such an approach would be a catalyst for commercial development of equipment required for the transportation and storage of SNF.

The FY 1996 Energy and Water Development Appropriation Act reserved $85 million in the Defense Nuclear Waste Disposal Appropriation which shall be available for obligation and expenditure only for an interim storage facility and only upon the enactment of specific statutory authority. At the appropriate time, the Administration will request the release of the $85 million for generic interim storage activities.

Spent Fuel Storage

This activity continues technology demonstration projects that have the potential to benefit one or more areas of the Program Element, including the Spent Fuel Management at West Valley Demonstration Project and the Spent Fuel Behavior in Long-Term Storage Project. Management responsibilities for the Spent Fuel Management at West Valley Demonstration Project and the Spent Fuel Behavior in Long-Term Storage Project will be transferred from the Office of Civilian Radioactive Waste Management to the Office of Environmental Management starting in FY 1997. This activity also includes contingency plans for interim storage.

Transportation

This activity will include contingency plans for a safe, environmentally acceptable, and cost-effective transportation capability. Activities provide planning for the necessary transportation equipment and services utilizing the private sector to the fullest extent possible. Contract(s) would be awarded for these services at an appropriate time. This activity also includes the planning, identification and resolution of institutional issues and interactions with stakeholders, the payment of

emergency assistance funds (Section 180(c)) at an appropriate time; and the development of analytical processes and transportation databases to support overall program requirements.

Waste Acceptance

Waste Acceptance activities focus on plans for achieving the legal physical transfer of waste to the Federal Government from the owners and generators of SNF and HLW, once a Federal facility is ready to begin operations; support the transportation, storage and disposal of waste, once accepted; and develop recommendations for the Department's Waste Acceptance policy. Activities required to facilitate Waste Acceptance include: 1) development of a process for the orderly transfer of SNF and HLW into the Federal system consistent with the needs of both the Federal Government and the owners and generators; 2) development of a plan to carry out the program's Waste Acceptance responsibilities; and 3) continuation of a collaborative dialogue with the Nation's nuclear utility companies as well as other owners and interested stakeholders.

MPC Subsystem

For FY 1995 and FY 1996, this activity continued the development of the Multi-Purpose Canister (MPC) Subsystem, including the design and preparation of a Safety Analysis Report (SAR). This activity is planned to conclude in FY 1996.

Project Management and Integration

Project Management and Integration (PM&I) consists of activities and tasks that support all of the product areas. Specifically, the PM&I area includes the traditional areas of project management, project control, and technical and programmatic integration of tasks and activities across the Project. These integration tasks include Project Integration, Systems Engineering, Environmental Safety and Health, and Quality Compliance.

1437

II. **Funding Schedule:**

Program Activity	FY 1995	FY 1996	FY 1997	$Change	%Change
Spent Fuel Storage	$ 3,130	$ 1,000	$ 2,300	$+ 1,300	+130%
Transportation	14,081	5,100	2,525	- 2,575	- 50%
Waste Acceptance	6,258	2,300	2,725	+ 425	+ 18%
MPC Subsystem	28,745	1,800	0	- 1,800	- 100%
Project Integration	4,515	3,400	2,450	- 950	- 28%
Total WAST	$ 56,729	$13,600	$10,000	$ - 3,600	- 26%

III. **Performance Summary:**

FY 1995 Accomplishments:

Spent Fuel Storage (FY 1995):

- For the Nuclear Fuel Services (NFS) Fuel Project, continued monitoring SNF in-pool storage at West Valley. Recertified a second Transnuclear cask to ship the fuel to Idaho National Engineering Laboratories.
- For the Dry Rod Consolidation Technology Disposition Project, procured storage and transport containers. Began cutting/packaging of spent fuel skeletons for shipment to Radioactive Waste Management Complex at Idaho National Engineering Laboratory.
- For Spent Fuel Behavior in Long-Term Storage Project, prepared engineering evaluation of the gas samples, fuel inspection readiness review, completed quarterly gas samples and annual project report. This program monitors the oldest SNF in dry storage in the U.S.
- Completed an Interim Storage Facility Design Study.
- Supported DOE/industry development of a dry spent nuclear fuel transfer system.

Transportation (FY 1995):

- Received first set of comments from the NRC on the GA-4/9 Safety Analysis Reports (submitted in FY 1994). Developed responses to comments.
- Fabricated half-scale model of GA-4 cask for use in regulatory testing. Regulatory tests were performed as part of the NRC Certification process for advanced technology high-capacity truck casks, and procurement planning for prototype casks was initiated.

- Completed the testing of the GA-9 legal-weight trailer and continued the testing of the legal-weight truck tractor.

- Completed Actinide-Only Pressurized Water Reactor Burnup Credit Topical Report and submitted it to the NRC. Completed specific studies and analyses to support the topical report. Acceptance of burnup credit could allow more fuel to be loaded into a cask or waste package, or reduce the need for neutron absorber material in the fuel basket.

- Completed a variety of studies, reports, and analyses that have supported the preparation of the MPC EIS, a risk management strategy, and nuclear utilities reactor site operations handbooks for SNF handling.

- Completed a position report as part of development of policy for implementing Section 180(c) of the Nuclear Waste Policy Act (NWPA).

- Completed OCRWM Transportation Report, describing the transportation program and institutional issue resolution.

- Stakeholder interactions were continued through public meetings, the exhibits program, and Cooperative Agreements such as those with the National Association of Regulatory Utility Commissioners, the National Congress of American Indians and the National Conference of State Legislatures.

Waste Acceptance (FY 1995):

- Prepared a summary report on the responses to the Notice of Inquiry (NOI) on DOE's obligation to accept waste in 1998. Identified issues resulting from the NOI, the MPC program, and the existing Annual Capacity Report that may require Standard Disposal Contract modifications.

- Completed current, quarterly fee verification and revenue projections. Began development of a Memorandum of Agreement for use between DOE and the waste owners that will address fees and terms of acceptance for Federally-owned SNF, defense and commercial HLW.

- Developed Waste Acceptance Criteria (WAC) Management Plan to establish a process for acceptance of alternate waste forms i.e., HLW, DOE SNF, and miscellaneous waste. Evaluated alternative waste forms being considered for repository disposal to determine applicability of established WAC. Supported the DOE SNF Steering Group and the Environmental Management Technical Review Group.

- Developed Waste Acceptance Operations Plan. Began development of Waste Acceptance Design Requirements Document. Reviewed and revised system level program and project documents impacting Waste Acceptance.

- Prepared Integrated Safeguards and Security Regulatory Model and Analysis, including IAEA approach to safeguards. Prepared Verification Plan and Safeguards and Security Plan.

23-254 96 – 46

1439

- Disseminated validated SNF data to Program users in the form of 1995 spent fuel projections, the 1995 Storage Requirements Report, and the 1995 Integrated Data Base (IDB) Annual Report.

Multi-Purpose Canister Subsystem (FY 1995):

- Evaluated vendor proposals and awarded a contract for Safety Analysis Report (SAR) design of MPC/Transportation Cask/Storage Module. Began SAR design of MPC Subsystem.
- Held three national scoping meetings. Issued an EIS Implementation Plan.
- Continued to evaluate development of the MPC Subsystem for certification. Monitored vendor MPC pre-certification interactions with the NRC.
- Continued other agency/industry interactions. Continued review of regulatory documents. Continued MPC issue resolution activities.

Project Management & Integration (FY 1995):

- Maintained and updated WAST program element cost and schedule baselines. Performed Project baseline management activities. Developed WAST program element Strategic Plan. Maintained WAST program element project control system.
- Developed the OWAST Annual Plan, IRB/OMB/Congressional budget submittals, and supported the project validation review process.
- Monitored cost and schedule performance, prepared status reports, and maintained project-level schedule networks.
- Conducted/supported systems studies, life cycle cost analyses and coordinated WAST program element support of the Total System Life Cycle Cost.
- Approved the revised WAST program element Systems Engineering Management Plan to incorporate the new Program Approach and baselined the MPC System Design Requirements Documents.
- Participated in Program Interface Control Working Group and developed Interface Control Documents.
- Developed preliminary draft WAST program element Test & Evaluation Master Plan.

FY 1996 Planned Accomplishments:

Spent Fuel Storage (FY 1996):

- Conduct contingency planning, studies and analyses (i.e. for a non site specific interim storage facility safety and environmental analyses.
- The Spent Fuel Behavior in Long Term Storage Project will continue. Provide funds for spent fuel storage at West Valley.
- Complete the Dry Rod Consolidation Technology Disposition Project.
- Complete negotiations to transfer management responsibilities for DOE owned spent fuel to Office of Environmental Management (EM). Transfer will occur on October 1, 1996.

Transportation (FY 1996):

- Complete GA-4 legal-weight truck (LWT) cask scale model regulatory tests and prepare data report, prepare lessons learned report for cask model fabrication and conduct orderly shutdown. Conduct orderly shut-down of testing of the GA-9 LWT cask trailer, prepare test report, and prepare lessons learned.
- Complete revised Actinide-Only Preasurized Water Reactor Burnup Credit Topical Report based on comments received from the NRC. Complete specific studies and analyses to support the topical report.
- Publish a Notice of Proposed Policy and Procedures for implementing Section 180(c) of the NWPA in the Federal Register.
- Stakeholder interactions will continue.
- Continue contingency planning and studies to prepare for transportation of Spent Nuclear Fuel (SNF) to an interim storage facility.

Waste Acceptance (FY 1996):

- Develop a WAST Operations Plan, including a WAST Concept of Operations.
- Process Delivery Commitment Schedules (DCSs) and issue the Acceptance Priority Ranking/Annual Capacity Report. Review DCS Exchange requests as required.
- Perform Interface activities with Purchasers/Producers.
- Process commercial spent nuclear fuel inventory database.

- Interact with DOE, IAEA, NRC, utilities and others concerning safeguards, including evaluation of IAEA approach to safeguards and development of overall safeguards, security and management, compliance and administrative (MC&A) requirements.

- Respond to litigation brought by producers of SNF due to DOE not being ready to accept waste in 1998.

- Continue development and testing of a Unified Database system that supports Waste Acceptance Planning and operations.

- Coordinate with Producers to develop Waste Acceptance Criteria compatible with CRWMS design requirements and Producer's development schedule.

Multi-Purpose Canister Subsystem (FY 1996):

- Complete the SAR Design and negotiate a contract closeout.

- Complete the Preliminary Draft MPC EIS and transfer lead responsibility to the Department of the Navy.

Project Management & Integration (FY 1996):

- Provide cost, schedule, planning, and integration related tools and services: cost and schedule baseline management; Strategic and Program Plan development/update; and, project management documentation.

- Develop the OWAST Annual Plan, IRB/OMB/Congressional budget submittals, and support the project validation review process.

- Provide WAST systems engineering services and tools to: implement technical management; maintain WAST life cycle cost estimates, support TSLCC, and update WAST program element LCC Report; maintain and manage the technical baseline.

- Comply with WAST Program Element Quality Assurance requirements.

FY 1997 Planned Accomplishments:

Spent Fuel Storage (FY 1997):

- Prepare responses to Congressional and Departmental inquiries. Activities include responding to questions from Congress as legislation is debated and DOE is asked for information.

- Continue limited contingency planning, studies and analyses (i.e. generic safety and environmental analyses).

Transportation (FY 1997):

- Issue Notice of Final Policy and Procedures for implementing Section 180(c) of the NWPA.
- Stakeholder interactions will be continued.
- Continue to pursue NRC approval of the burn-up credit.
- Continue contingency planning.

Waste Acceptance (FY 1997):

- Complete testing of the Unified Database.
- Continue contingency planning.
- Interact with DOE, IAEA, NRC, utilities and others concerning safeguards, including evaluation of IAEA approach to safeguards.
- Process Delivery Commitment Schedules (DCSs) and review DCS Exchange requests as required.
- Process commercial SNF inventory database.
- Perform fee verification for commercial SNF.
- Begin implementation of RW/EM Memorandum of Agreement on acceptance of EM's waste forms, baseline preliminary Waste Acceptance Criteria (WAC) for alternative waste forms, and continue to refine and develop WAC.

Multi-Purpose Canister Subsystem (FY 1997):

- Activities were terminated in FY 1996.

Project Management & Integration (FY 1997):

- Provide cost, schedule, planning, and integration related tools and services; cost and schedule baseline management; Program Plan development/update; and, project management documentation.
- Regularly status the Project cost, schedule and technical performance.

- Develop the OWAST Annual Plan, IRB/OMB/Congressional budget submittals, and support the project validation review process.
- Provide WAST systems engineering services and tools to: implement technical management; maintain WAST life cycle cost estimates, support TSLCC, and update WAST program element LCC Report; maintain and manage the technical baseline; conduct/coordinate system studies and analyses; and perform/support verification and design control.
- Provide Environment, Safety and Health management/planning.
- Comply with WAST Program Element Quality Assurance requirements.

FY 1998 Planned Accomplishments:

Spent Fuel Storage (FY 1998):

- Prepare responses to Congressional and Departmental inquiries. Activities include responding to questions from Congress as legislation is debated and DOE is asked for information.
- Continue contingency planning, studies and analyses (i.e. non site specific safety and environmental analyses) in preparation for completion of Viability Assessment in the FY 1998-1999 timeframe.

Transportation (FY 1998):

- Work on awarding RFP for canister, transport cask and storage module production, and waste acceptance and transportation services at the appropriate time.
- Work with States and Tribes for implementing Section 180(c) of the NWPA, as amended.
- Continue to pursue NRC approval of burn-up credit
- Work on detailed development of operational procedures for waste acceptance and transportation activities.
- Continue contingency planning.

Waste Acceptance (FY 1998):

- Complete and deploy the Unified Database.
- Perform Interface activities with Purchasers/Producers.

- Interact with DOE, IAEA, NRC, utilities and others concerning safeguards, including evaluation of IAEA approach to safeguards.
- Process Delivery Commitment Schedules (DCSs) and issue the Acceptance Priority Ranking/Annual Capacity Report. Review DCS Exchange requests as required.
- Process commercial SNF inventory database.
- Perform fee verification for commercial SNF.
- Continue implementation of RW/EM Memorandum of Agreement on acceptance of EM's waste forms, baseline preliminary Waste Acceptance Criteria (WAC) for alternative waste forms, and continue to refine and develop WAC.
- Continue contingency planning.

Multi-Purpose Canister Subsystem (FY 1998):

- Activities were terminated in FY 1996.

Project Management & Integration (FY 1998):

- Provide cost, schedule, planning, and integration related tools and services; cost and schedule baseline management; Program Plan development/update; and, project management documentation.
- Regularly status the Project cost, schedule and technical performance.
- Develop the OWAST Annual Plan, IRB/OMB/Congressional budget submittals, and support the project validation review process.
- Provide WAST systems engineering services and tools to: implement technical management; maintain WAST life cycle cost estimates, support TSLCC, and update WAST program element LCC Report; maintain and manage the technical baseline; conduct/coordinate system studies and analyses; and perform/support verification and design control.
- Provide Environment, Safety and Health management/planning.
- Comply with WAST Program Element Quality Assurance requirements.

International Waste (FY 1995):

- Continued technical program agreements with Canada, Sweden and Switzerland to participate in joint activities on borehole tracer techniques, geological mapping and measurement techniques, and assessment of engineered barrier safety.

Program Management (FY 1995):

- Updated Program Work Breakdown Structure (WBS) and the Program Cost and Schedule Baselines (PCSB) to reflect the Program Approach.
- Completed FY 1995 Total System Life Cycle Cost report.
- Received approval from the Secretary of Energy to manage OCRWM as a single Strategic System rather than two Major System Acquisitions.
- Issued draft Program Management Plan that addressed the management of OCRWM as a single Strategic System.
- Completed final closeout activities for the Basalt Waste Isolation Project (BWIP) which was terminated by Congress in December 1987.

HUMAN RESOURCES AND ADMINISTRATION

Human Resources Development (FY 1995):

- Developed computerized Customer Service Plan and training program; initiated and implemented Career Development Program; and initiated consolidation of QA training and verification procedures to be used Program-wide.
- Developed human resources system which contains pertinent information on employees, including copies of position descriptions and performance plans, as well as tracks recurring mandated requirements.
- Closed out three hundred QA training and qualification records; and developed a draft plan for employee recognition.

Audits, Education and Information (FY 1995):

- Developed and submitted OCRWM's Annual Report to Congress on FY 1994 activities and expenditures.

- Prepared and submitted audited NWF and Defense Nuclear Waste Disposal financial statements to the Chief Financial Officer for transmittal to OMB.

- Developed and submitted OCRWM's Annual Assurance Memorandum required by the Federal Managers' Financial Integrity Act to the Secretary for incorporation into the Secretary's report to the President.

- Managed the NWF investment portfolio, which outperformed the intermediate Treasury Bond Fund index.

- Managed the OCRWM National Information Center (NIC), which provided information and education services to customers, stakeholders, the public, and Federal staff.

- Complied with Executive Order 12677 by conducting an HBCU Program that supported four HBCU faculty research projects and developed a new HBCU Undergraduate Scholarship Program.

- Conducted OCRWM's Radioactive Waste Management Graduate Fellowship Program, which supported fifteen academically superior graduate students pursuing advanced degrees in radioactive waste management-related fields.

Information Management (FY 1995):

- Established a corporate information management (IM) structure; developed an integrated, OCRWM-wide IM planning process; issued the first OCRWM IM Strategic Plan and initiated multi-year planning.

- Developed and implemented the OCRWM Home Page that provides access on the Internet to OCRWM programmatic information. The Home Page was accessed an average of 5,000 times per week.

- Developed and initiated the implementation of an IM performance assessment and improvement program designed to facilitate OCRWM compliance with statutes, regulations, and directives, and to promote continuous improvement of OCRWM's IM practices and operations.

- Initiated the development and implementation of an OCRWM information architecture to provide the foundation for the definition, organization, development, maintenance, and management of, and access to, all OCRWM data, records, and information systems.

- Implemented process improvements that save time, reduce costs, and enhance productivity, including paperless correspondence control, controlled milestone tracking, and automated forms systems; and a streamlined records management process that uses imaging technology to reduce entry and retrieval times.

- Installed and managed a Program-wide videoconferencing capability that provided over 800 hours of videoconferencing and significantly reduced Program travel costs.

- Fully implemented electronic messaging and calendaring capabilities that process an average of 250,000 messages per month.

Contract Business Management (FY 1995):

- Provided essential senior-level advisory staff support on streamlining office work processes and work flow; and provide Headquarters support services contractor operating and administrative expenses.

FY 1996 Accomplishments (to date and planned):

QUALITY ASSURANCE (FY 1996):

- Support increased activity (science and construction) in Exploratory Studies Facility (ESF), repository Advanced Conceptual Design (ACD), and the Geologic Repository Operations Area (GROA).

- Maintain QA Program document (QARD); make changes as needed based on program requirements.

- Support DOE Office of Environmental Management (EM) radioactive functional runs at Savannah River and West Valley.

- Continue to conduct audits, surveillances, and reviews as required by NRC regulations; support revision(s) to technical baseline (reviews and overviews); continue consolidation of Program suppliers; and complete transition of QA organizations into the M&O.

- Issue Program-wide root cause analysis procedure.

- Support WAST development of Unified Database; support WAST draft acquisition activities for procurement of a full service transportation contractor; and support WAST contingency planning and studies for a generic ISF.

PROGRAM MANAGEMENT

Systems Integration (FY 1996):

- Provide program-level systems engineering and integration support for the OCRWM program and on-going Yucca Mountain site characterization, Waste Package and Repository Design activities, and the Waste Acceptance, and Transportation.

- Provide systems engineering guidance and communicate requirements for the design of repository, surface facilities and waste packages, and storage and transportation systems.

- Ensure that the interface requirements between the repository and the WAST project are adequately addressed and managed.

- Maintain Interface Control Documents, identifying interface agreements which affect both projects and facilitate information exchange and communication with all program participants.

- Continue to integrate, update and maintain the program Baseline Management Plans and procedures, support of the Program Change Control Board, and support audits and verifications of baseline management implementation.

- Operate and maintain the OCRWM-wide Configuration Information System.

Regulatory Integration (FY 1996):

- Coordinate and participate in interactions with the Nuclear Regulatory Commission and its staff to address management and technical issues related to the repository program, interim storage and transportation of spent fuel.

- Coordinate and integrate program environmental, safety, and health activities to ensure compliance with departmental directives and policies.

- Provide policy guidance and regulatory support to the Yucca Mountain Site Characterization Office in the definition, planning, and execution of the revised geologic disposal program. Provide technical and regulatory input and policy guidance in developing the Departmental positions and technical input to the Environmental Protection Agency's development of radiation release standards for a repository at Yucca Mountain.

Strategic Planning (FY 1996):

- Continue preparing Director's and Deputy Director's briefing materials and issue papers for Administration and Congressional Testimonies.

- Continue to respond to Administrative and Congressional inquiries regarding program status, policies, and direction.

- Continue to provide liaisons with the Nuclear Waste Technical Review Board to address and resolve technical issues associated with program activities responding to Congressional direction to refocus the program and FY 1996 funding restrictions.

International Waste (FY 1996):

- Closed out technical program agreements with Canada, Sweden and Switzerland due to delayed repository site characterization activities and funding restrictions.

Program Management (FY 1996):

- Complete FY 1996 Fee Adequacy Analysis; finalize Program Management Plan; and complete streamlining of management reporting systems.
- Implement the Strategic System concept whereby the program is managed as a single system including two projects and a program integration element.
- Initiate Contract Funds Status Report (CFSR) system.
- Improve program and project management systems design and implementing procedures including redefining management responsibilities, baseline change authority thresholds, cost estimating methods, and streamlining of the planning and control system.
- Update program and project cost and schedule baselines, schedule networks, and bases of estimates.
- Complete Cost Estimating Guide.
- Consolidate support services contractors.

HUMAN RESOURCES AND ADMINISTRATION

Human Resources Development (FY 1996):

- Conduct essential quality assurance training, but delay customer service training plan.
- Maintain personnel tracking database; transfer the development and review of position descriptions and performance plans for all Headquarters personnel; and the maintenance of QA training and qualification records to management.

Audits, Education and Information (FY 1996):

- Develop and submit OCRWM's Annual Report to Congress on FY 1995 activities and expenditures, OCRWM's section of Secretary's FY 1994/1995 Performance Report, audited NWF and Defense Nuclear Waste Disposal financial statements to the Chief Financial Officer for transmittal to OMB, and develop and submit OCRWM's

1450

Annual Assurahce Memorandum required by the Federal Managers' Financial Integrity Act to the Secretary for incorporation into the Secretary's report to the President.

- Submit to the Congress and the Chief Financial Officer, respectively, the Department's response to final GAO reports and Departmental positions on final IG audit reports.
- Manage the NWF investment portfolio.
- Continue at reduced scope the activities performed by the NIC to focus on minimal, basic services to customers, stakeholders, the public, and Federal staff.
- Comply with Executive Order 12677 by conducting an HBCU undergraduate Scholarship Program that supports 10 students.
- Reduce the Radioactive Waste Management Graduate Fellowship Program to support twelve graduate students pursuing advanced degrees in waste management-related fields.

Information Management (FY 1996):

- Maintain local area network (LAN) and wide area network (WAN) operations at FY 1995 levels.
- Reduce scope of IM activities to a level that focuses on providing minimum essential customer services.
- Reduce computer-related training support; discontinue backup coverage and cross-training of technical support personnel; and reduce records processing capability for records backlog.

Contract Business Management (FY 1996):

- Provide support for streamlining senior management work processes and work flow; and provide Headquarters support services contractor operating and administrative expenses.

FY 1997 Planned Accomplishments

QUALITY ASSURANCE (FY 1997):

- Support continued revision(s) to Technical Baseline and the completion of DOE/EM hot functional runs for acceptance of defense vitrified waste and DOE/EM qualification of Spent Fuel Site QA Programs.
- Continue to conduct audits, surveillance, and reviews as required by NRC regulations; and coordinate performance of the QAMA process.

- Support increased activity in the Yucca Mountain Site Characterization effort.
- Support increased efforts in Repository Design.

PROGRAM MANAGEMENT

Systems Integration (FY 1997):

- Provide program-level systems engineering and integration support for the OCRWM program and on-going Yucca Mountain site characterization, Waste Package and Repository Design activities, and the Waste Acceptance, Transportation and Interim Storage efforts.
- Provide systems engineering guidance and communicate requirements for the design of repository, surface facilities and waste packages, and storage and transportation systems.
- Ensure that the interface requirements between the repository and the WAST project are adequately addressed and managed.
- Maintain Interface Control Documents, identifying interface agreements which affect both projects and facilitate information exchange and communication with all program participants.
- Support the evaluation of alternative system design proposals.
- As site characterization, repository design activities and transportation and interim storage efforts progress, incorporate latest concepts into system operation models, conduct system studies to evaluate impact of repository design and operational concepts on the overall CRWMS, and assess system cost tradeoffs, waste logistics, and storage options.
- Continue to integrate, update and maintain the program Baseline Management Plans and procedures, support of the Program Change Control Board, and support of audits and verifications of baseline management implementation.
- Operate and maintain the OCRWM-wide Configuration Information System.

Regulatory Integration (FY 1997):

- Coordinate and participate in interactions with the Nuclear Regulatory Commission and its staff to address management and technical issues related to the repository program, interim storage and transportation of spent fuel.

1452

- Coordinate and integrate program environmental, safety, and health activities to ensure compliance with departmental directives and policies.

- Provide regulatory assessments of storage and disposal considerations for other waste forms as proposed by other Departmental offices.

Strategic Planning (FY 1997):

- Continue preparing Director's and Deputy Director's briefing materials and issue papers for Administration and Congressional Testimonies.

- Continue to respond to Administrative and Congressional inquiries regarding program status, policies, and direction.

- Continue to provide liaisons with the Nuclear Waste Technical Review Board to address and resolve technical issues associated with site suitability activities.

International Waste (FY 1997):

- Reestablish necessary cooperative international agreements with regard to geologic disposal studies to support a delayed site suitability decision.

Program Management (FY 1997):

- Complete FY 1997 TSLCC Report; and conduct FY 1997 Fee Adequacy Analysis and publish report.

- Continue to improve program and project management systems.

- Continue to update program and project cost and schedule baselines, schedule networks, and bases of estimates.

- Update Strategic Integrated and Summary Schedule Networks.

- Continue to support implementation of improved departmental management policies.

HUMAN RESOURCES AND ADMINISTRATION

Human Resources Development (FY 1997):

- Update course outlines, instruction guides and lesson plans for quality assurance training; and conduct minimum essential quality assurance training.

- Maintain Quality Assurance training tracking system.

Audits, Education and Information (FY 1997):

- Develop and submit OCRWM's Annual Report to Congress on FY 1996 activities and expenditures, audited NWF and Defense Nuclear Waste Disposal financial statements to the Chief Financial Officer for transmittal to OMB, OCRWM's Annual Assurance Memorandum required by the Federal Managers' Financial Integrity Act to the Secretary for incorporation into the Secretary's report to the President, and the Department's formal response to final GAO reports and Departmental Positions on final Inspector General audit reports.
- Manage the NWF investment portfolio.
- Manage the provision of basic information services to customers, stakeholders, the public, and Federal staff.
- Maintain the HBCU Undergraduate Scholarship Program.
- Reduce support for Radioactive Waste Management Graduate Fellowship Program to 5 graduate students pursuing advanced degrees in waste management-related fields.

Information Management (FY 1997):

- Further postpone LAN upgrade from FY 1996.
- Postpone renewal of hardware and software contracts.
- Further reduce selected services from FY 1996 levels, including: records processing; computer-related training; and Help Desk support.
- Cancel the following planned enhancements: videoconferencing upgrade; records management process improvement; information architecture implementation; and performance assessment and improvement program implementation.

Contract Business Management (FY 1997):

- Provide essential support to the program senior management and provide Headquarters support services contractor operating and administrative expenses.

1454

FY 1998 Planned Accomplishments

QUALITY ASSURANCE (FY 1998)

- Support WAST Program Element FY 1998 activities including: ISF interim storage site assessment and site investigation activities, Phase I facility design, and Phase I license application activities.
- Continue to support system integration, engineering activities; and continue to support EM vitrification and DOE-owned spent fuel activities.
- Coordinate performance of QAMA process; and continue to conduct audits, surveillance, and reviews of quality affecting activities.
- Support procurement activities associated with transportation services.
- Continue to support Yucca Mountain program element site characterization effort.

PROGRAM MANAGEMENT:

Systems Integration (FY 1998):

- Provide program-level systems engineering and integration support for the OCRWM program and on-going Yucca Mountain site characterization, Waste Package and Repository Design activities, and the Waste Acceptance, Transportation and Interim Storage efforts.
- Ensure that the baseline system described in the Program-level documents is consistent with current approved program approach and responsive to project-level design needs.
- Provide systems engineering guidance and communicate requirements for the design of repository, surface facilities and waste packages, and storage and transportation systems.
- Ensure that the interface requirements between the repository and the WAST project are adequately addressed and managed.
- Maintain Interface Control Documents, identifying interface agreements which affect both projects and facilitate information exchange and communication with all program participants.
- As site characterization, repository design activities and transportation and interim storage efforts progress, incorporate latest concepts into system operation models, conduct system studies to evaluate impact of repository

design and operational concepts on the overall CRWMS, and assess system cost tradeoffs, waste logistics, and storage options.

- Continue to integrate, update and maintain the program Baseline Management Plans and procedures, support of the Program Change Control Board, and support audits and verifications of baseline management implementation.

- Operate and maintain the OCRWM-wide Configuration Information System.

Regulatory Integration (FY 1998):

- Coordinate and participate in interactions with the Nuclear Regulatory Commission and its staff to address management and technical issues related to the repository program, interim storage and transportation of spent fuel.

- Coordinate and integrate program environmental, safety, and health activities to ensure compliance with departmental directives and policies.

- Provide regulatory assessments of storage and disposal considerations for other waste forms as proposed by other Departmental offices.

Strategic Planning (FY 1998):

- Continue preparing Director's and Deputy Director's briefing materials and issue papers for Administration and Congressional Testimonies.

- Continue to respond to Administrative and Congressional inquiries regarding program status, policies, and direction.

- Continue to provide liaisons with the Nuclear Waste Technical Review Board to address and resolve technical issues associated with site suitability activities.

International Waste (FY 1998):

- Maintain necessary cooperative international agreements with regard to geologic disposal studies to support a delayed site suitability decision.

Program Management (FY 1998):

- Continue to improve program and project management systems; and continue to update program and project cost and schedule baselines, schedule networks, and bases of estimates.

- Conduct FY 1998 Fee Adequacy Analysis and publish report.

- Update Strategic Integrated and Summary Schedule Networks; and continue to support implementation of improved departmental management policies.

HUMAN RESOURCES AND ADMINISTRATION

Human Resources Development (FY 1998):

- Update course outlines, instruction guides and lesson plans for quality assurance training; conduct minimum essential quality assurance training; and maintain quality assurance tracking system.

Audits, Education and Information (FY 1998):

- Develop and submit OCRWM's Annual Report to Congress and develop OCRWM's section of the Secretary's Performance Report, OCRWM's Annual Assurance Memorandum to the Secretary, and Departmental responses to GAO and IG audit reports.

- Manage the NWF and submit audited financial statements to the CFO.

- Provide minimal, basic public information products and services.

- Conduct HBCU and OCRWM graduate fellowship programs at FY 1997 levels.

- Prepare to respond to new public information requirements if program is redirected.

Information Management (FY 1998):

- Maintain LAN operations at FY 1997 level; and maintain FY 1997 level of user support services, training, Help Desk support, and records processing.

- Mitigate effects of unfunded hardware and software maintenance agreements on systems availability.

- Minimize effects of unfunded hardware and software upgrades on compatibility and interoperability with other DOE AOSS/ADP systems and other DOE organizations.

- Reduce WAN bandwidth.

Contract Business Management (FY 1998):

- Provide essential support to the program senior management; and provide Headquarters support services contractor operating and administrative expenses.

FY 1999 Planned Accomplishments

QUALITY ASSURANCE (FY 1999):

- Continue to support WAST Program Element FY 1998 activities including: interim storage site assessment and site investigation activities, Phase I facility design, and Phase I license application activities.
- Continue to support system integration, engineering activities; and continue to support EM Vitrification and DOE-owned spent fuel activities.
- Coordinate performance of QAMA process; and continue to conduct audits, surveillance, and reviews of quality affecting activities.
- Continue to support procurement activities associated with transportation services.
- Continue to support Yucca Mountain program element site characterization, surface/subsurface testing, and repository efforts.

PROGRAM MANAGEMENT

Systems Integration (FY 1999):

- Provide program-level systems engineering and integration support for the OCRWM program and on-going Yucca Mountain site characterization, Waste Package and Repository Design activities, and the Waste Acceptance, Transportation and Interim Storage efforts.
- Ensure that the baseline system described in the Program-level documents is consistent with current approved program approach and responsive to project-level design needs.
- Provide systems engineering guidance and communicate requirements for the design of repository, surface facilities and waste packages, and storage and transportation systems.
- Ensure that the interface requirements between the repository and the WAST project are adequately addressed and managed.

- Maintain Interface Control Documents, identifying interface agreements which affect both projects and facilitate information exchange and communication with all program participants.
- Support the evaluation of alternative system design proposals.
- As site characterization, repository design activities and transportation and interim storage efforts progress, incorporate latest concepts into system operation models, conduct system studies to evaluate impact of repository design and operational concepts on the overall CRWMS, and assess system cost tradeoffs, waste logistics, and storage options.
- Continue to integrate, update and maintain the program Baseline Management Plans and procedures, support of the Program Change Control Board, and support audits and verifications of baseline management implementation.
- Operate and maintain the OCRWM-wide Configuration Information System.

Regulatory Integration (FY 1999):

- Coordinate and participate in interactions with the Nuclear Regulatory Commission and its staff to address management and technical issues related to the repository program, interim storage and transportation of spent fuel.
- Coordinate and integrate program environmental, safety, and health activities to ensure compliance with departmental directives and policies.
- Provide technical and regulatory support for the resolution of regulatory issues associated with a national transportation program that includes a substantial number of spent nuclear fuel shipments.
- Provide regulatory assessments of storage and disposal considerations for other waste forms as proposed by other Departmental offices.

Strategic Planning (FY 1999):

- Continue preparing Director's and Deputy Director's briefing materials and issue papers for Administration and Congressional testimonies.
- Continue to respond to Administrative and Congressional inquiries regarding program status, policies, and direction.
- Continue to provide liaison with the Nuclear Waste Technical Review Board to address and resolve technical issues associated with site suitability activities.

International Waste (FY 1999):

- Maintain essential cooperative international agreements with regards to geologic disposal studies to support a delayed site suitability decision.

Program Management (FY 1999):

- Continue to improve program and project management systems; and continue to update program and project cost and schedule baselines, schedule networks, and bases of estimates.
- Conduct FY 1999 Fee Adequacy Analysis and publish report.
- Update Strategic Integrated and Summary Schedule Networks.
- Continue to support implementation of improved departmental management policies.

HUMAN RESOURCES AND ADMINISTRATION

Human Resources Development (FY 1999):

- Update course outlines, instruction guides and lesson plans for quality assurance training; and conduct minimum essential quality assurance training.
- Maintain quality assurance training tracking system.

Audits, Education and Information (FY 1999):

- Develop and submit OCRWM's Annual Report to Congress, OCRWM's Annual Assurance Memorandum to the Secretary, and Departmental responses to GAO and IG audit reports.
- Manage the NWF and submit audited financial statements to the CFO.
- Provide minimal, basic public information products and services.
- Conduct HBCU and OCRWM graduate fellowship programs at FY 1997 levels.
- Prepare to respond to new public information requirements if program is redirected.

1460

Information Management (FY 1999):

- Maintain LAN and WAN operations at FY 1998 level; and maintain FY 1997 level of user support services, training, Help Desk support, and records processing.
- Mitigate effects of unfunded hardware and software maintenance agreements on systems availability.
- Minimize effects of unfunded hardware and software upgrades on compatibility and interoperability with other DOE AOSS/ADP systems and other DOE organizations.

Contract Business Management (FY 1999):

- Provide essential support to the program senior management; and provide Headquarters support services contractor operating and administrative expenses.

IV. **Explanation of Funding Changes FY 1996 to FY 1997**

QUALITY ASSURANCE

- The decrease of $3,247K in FY 1997 is due to the decrease in overall WAST Technical Activities including termination of the MPC program.

PROGRAM MANAGEMENT

International Waste

- The increase from zero to $700K reflects the reestablishment of cooperative international agreements with regard to geologic disposal studies which were closed out in FY 1996.

HUMAN RESOURCES AND ADMINISTRATION

Information Management

- Overall Program reductions directed by Congress for FY 1996 have resulted in an IM program that provides only minimum basic services. Because of the anticipated lack of carryover funds, selected other services will be further reduced below FY 1996 levels and all other enhancements postponed from FY 1996 will be canceled.

V. **Major Issues**

PROGRAM INTEGRATION

Strategic Planning

- Planning activities are dependent upon enactment of pending legislation and the direction or guidance provided.

1462

PROGRAM DIRECTION

I. Mission Supporting Goals and Objectives

Program direction provides overall direction and administrative support for the Nuclear Waste Fund program to manage and dispose of the Nation's spent nuclear fuel and high-level radioactive waste.

Program direction has been grouped into three categories: 1) Salaries and Benefits; 2) Travel; and 3) Other Related Expenses.

Salaries and Benefits

This element includes compensation for regular salaries and wages paid directly to civilian full-time permanent and other than full-time permanent employees, other payments that become a part of the employee's basic pay rate and other personnel compensation such as overtime, holiday pay and cash incentive awards. Benefits includes payments such as the employer's share of employee retirement, health and life insurance, accident compensation, Federal Insurance Contribution Act taxes, and Federal Retirement Thrift Savings Plan. Benefits also includes payments for former employees such as severance pay to employees involuntarily separated, and voluntary separation incentives. This includes payments to the unemployment fund, payments of nine percent of final basic pay to the civil service retirement fund for employees who took the early-out or buy-out authority, and payments to the Employees health benefits fund for annuitants.

Travel

This category provides funding for the transportation of Government employees, their per diem allowances while in authorized travel status, and other expenses incidental to travel that are to be paid by the Government either directly or by reimbursing the traveler.

Other Related Expenses

Other Related Expenses includes payments for rental space, telecommunications, utilities and miscellaneous charges, printing and reproduction, other services (tuition, employee development), operation and maintenance of equipment, purchases of goods and services for government accounts, supplies and materials and equipment.

II. Funding Schedule:

PROGRAM DIRECTION:	FY 1995 Comparable Appn	FY 1996 Original Appn	Real & Comp Adjust	FY 1996 Comparable Appn	FY 1997 Budget Request	FY 1998 Budget Request	FY 1999 Budget Request
Idaho:							
Salaries and Benefits	156	164	0	164	0	0	0
Travel	15	12	0	12	0	0	0
Other Related Expenses	88	92	0	92	0	0	0
Total, Idaho	259	268	0	268	0	0	0
FTE's	2	2	0	2	0	0	0
Average FTE	130	134	0	134	0	0	0
Richland:							
Salaries and Benefits	71	73	0	73	75	77	80

III. **Performance Summary**

FY 1995 Accomplishments

Program Direction:

- Developed and implemented a Career Development Program.
- Sponsored a Career Awareness Day for RW employees.
- Provided training to the entire RW organization on the "7 Habits of Highly Effective People."
- Completed implementation of the RW reorganization at both Headquarters and the Yucca Mountain Site Characterization Office which resulted in the elimination of all Branch Chiefs, reducing the number of offices from 44 to 23.
- Shift Full-Time Equivalents from Headquarters to the Yucca Mountain Site Characterization Office.
- Conducted RW's first quality management self-assessment at Headquarters and the Yucca Mountain Site Characterization Office based on the Malcolm Baldrige National Quality Award Criteria.
- Developed an RW EEO/Affirmative Action Plan for FY 1995.
- Began the consolidation of quality assurance training and verification of personnel procedures, which will result in one procedure which will be used program-wide.
- Instituted overtime ceilings to accommodate a 10 percent reduction in overtime costs throughout the Program.

FY 1996 Planned Accomplishments

- Institute travel ceilings in accordance with Secretarial initiative to accomplish a 20 percent reduction in travel costs.
- Develop and implement an Employee Recognition Program.
- Further streamline the RW organization to meet Secretarial initiative to achieve a 11:1 employee to supervisor ratio.
- Implement the consolidated quality assurance training and verification of personnel procedure throughout the Program.
- Continue to shift Full-Time Equivalents from Headquarters to the Yucca Mountain Site Characterization Office.
- Reduce support services contractor staff by 20 percent.

- Develop and implement a 360 degree performance appraisal process.
- Conceptualize and develop a Training Plan, which includes the Yucca Mountain Site Characterization Office.
- Conduct a quality management self-assessment at Headquarters and the Yucca Mountain Site Characterization Office.
- Continue to downsize the RW Federal staff to meet Secretarial initiatives.

FY 1997 Planned Accomplishments

- Continue to streamline the RW organization to meet Secretarial initiatives in the area of employee to supervisor ratios.
- Develop strategies to downsize organization to meet FTE levels dictated by the Secretary of Energy.
- Develop and implement Annual Training Plans and conduct Training Needs Surveys.
- Conduct yearly quality management self-assessments.

FY 1998 Planned Accomplishments

- Continue to streamline the RW organization to meet Secretarial initiatives in the area of employee to supervisor ratios.
- Develop strategies to downsize organization to meet FTE levels dictated by the Secretary of Energy.
- Develop and implement Annual Training Plans and conduct Training Needs Surveys.
- Conduct yearly quality management self-assessments.

FY 1999 Planned Accomplishments

- Continue to streamline the RW organization to meet Secretarial initiatives in the area of employee to supervisor ratios.
- Develop strategies to downsize organization to meet FTE levels dictated by the Secretary of Energy.
- Develop and implement Annual Training Plans and conduct Training Needs Surveys.
- Conduct yearly quality management self-assessments.

1467

IV. **Explanation of Funding Changes from FY 1996 to FY 1997**

The Program will comply with the Secretary's Strategic Alignment by reducing its FTE's from 248 in FY 1996 to 230 in FY 1997. Historical records indicate that these reductions will be concentrated in the last quarter of FY 1997. Therefore, because the departures are late in the fiscal year, the Program requires an increased funding profile in FY 1997 to fund both salaries/benefits and any costs associated with the reduction of 18 FTE's.

V. **Explanation of Average FTE Costs**

Headquarters represents a fully loaded FTE cost for federal personnel at the Yucca Mountain Site Characterization Office as well as the federal personnel in Washington D.C. This specifically includes salaries, benefits, travel, rent at the Forrestal building, rent at the facility in Las Vegas, utilities, telecommunications as well as materials and supplies. The change in the average cost from one fiscal year to the next can be contributed to any costs associated with a reduction in force.

PROPOSED APPROPRIATION LANGUAGE

For necessary expenses of operation and maintenance of projects in Alaska and of marketing electric power and energy, [$4,260,000] $4,000,000, to remain available until expended.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
ALASKA POWER ADMINISTRATION
(Tabular dollars in thousands, Narrative in whole dollars)

ALASKA POWER ADMINISTRATION

EXECUTIVE BUDGET SUMMARY

Mission:

Alaska Power Administration will continue to encourage economic and industrial development in Alaska, and repay the taxpayers' investment by providing and marketing reliable hydroelectric power generated at its facilities. We will market the power at the lowest rates possible, and operate and maintain our generation and transmission facilities in a safe and environmentally-sensitive manner consistent with sound business principles.

Alaska Power Administration markets power produced at its two hydroelectric generating projects, Snettisham located near Juneau and Eklutna located near Anchorage within the State of Alaska. Preference is given in the sale of the power to public bodies and cooperatives.

Alaska Power Administration owns and operates all of its generation and transmission facilities.

Alaska Power Administration is in the process of implementing the Alaska Power Administration Asset Sale and Termination Act (Public Law 104-58). The law authorizes the sale of the Alaska Power Administration assets. However, Congressional approval is still needed for the use of tax-exempt bonds to finance the purchase of the Snettisham Project. This budget request is to provide continued operation and maintenance of both projects during Federal ownership. If the transfers take place before the end of FY 1997, any unobligated appropriations will be returned to the Treasury of the United States according to Alaska Power Administration Asset Sale and Termination Act.

The GOALS of Alaska Power Administration are to:

1. Maximize energy production in an efficient, reliable, safe, and environmentally-sensitive manner for our customers, and minimize long-term costs while protecting the federal investment.

2. Operate, maintain, and market power from Eklutna and Snettisham in accordance with authorizing legislation and continuing full utilization of each Projects' energy and peaking capabilities.

The OBJECTIVES related to these goals are:

1. To PROVIDE TRAINING for employees to enhance marketability.

2. To MAXIMIZE ENERGY PRODUCTION by operating both projects in an efficient, reliable, safe, and environmentally-sensitive manner, while protecting the Federal investment;

3. To PERFORM ALL NECESSARY MAINTENANCE to project facilities.

4. To ENHANCE PUBLIC USE OF PROJECT LANDS AND FACILITIES via visitation, reservoir recreation, cooperation with the Alaska Department of Fish and Game in salmon production at Snettisham, and cooperation with the Cook Inlet Aquaculture Association's fish hatchery and Municipality of Anchorage's water supply projects at Eklutna.

EMERGENCY FUND

The FY 1997 request assumes $200,000 in emergency funds appropriated by Congress in FY 1984 to ensure continuity of service will remain available in FY 1997 for that purpose. In the event the use of emergency funds is necessary in FY 1997, immediate restoration of the fund will be requested to maintain operation of APA's financial flexibility to respond to unplanned events.

PERFORMANCE MEASURES:

Performance measures related to Alaska Power Administration are based on outputs and outcomes. Data for each output is collected at its own frequency. These outputs are aimed at achieving specific outcomes including, establishment of rates sufficient to make full and timely payment to the U.S. Treasury, maintenance of the health and safety of all employees, development and achievement of the operation of a reliable, low-cost, environmentally-sound generation system which facilitates competitive and efficient wholesale power supplies. This data is compared with past data to insure APA outputs and outcomes are appropriate. Outputs include:

1. Debt service coverage ratio.

2. Cumulative principle payments as a percentage of total Federal debt.

3. Percent variance of actual from planned annual principle payments.

4. Net cash flow to Treasury.

5. Generation reliability index.

6. Transmission reliability index.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- APA's streamlining efforts resulted in a 33% reduction of supervisory positions in APA Headquarters.
- APA has remained within the allotted FTE ceiling and will continue to conduct position analysis of all vacancies to determine if each position must be filled or utilize alternative methods where applicable to accomplish needed work.
- Based upon the historical high level of turnover and advanced office automation efforts and technology there will be decreased administrative and budget/finance staff support needs, we will achieve the FY 1997 FTE target number through attrition:

FY 95	FY 96	FY 97
30	35	34

- Public Law 104-58, signed by the President on November 28, 1995, authorizes the sale of the Alaska Power Administration assets. The Snettisham Project will be sold to the State of Alaska and the Eklutna Project to the three current power customers, Municipal Light and Power, Chugach Electric Association, Inc. and Matanuska Electric Association, Inc. While DOE and APA expect to complete the sale of the Eklutna Project by early 1997 and continue to pursue the financing arrangements for the completion of the sale of the Snettisham Project to the State of Alaska, continued operation and maintenance of the projects while under Federal ownership will remain a priority. As such, the FY 1997 request provides minimal funding and personnel ceiling for the continuation of the operation, maintenance, and power marketing programs at APA.

ALASKA POWER ADMINISTRATION

PROGRAM MISSION

Alaska Power Administration (APA) will continue to encourage economic and industrial development in Alaska, and repay the taxpayers' investment by providing and marketing reliable hydroelectric power generated at its facilities. We will market the power at the lowest rates possible, and operate and maintain our generation and transmission facilities in a safe and environmentally-sensitive manner consistent with sound business principles.

APA facilities are the 78 megawatt Snettisham Project near Juneau and the 30 megawatt Eklutna Project near Anchorage. APA markets wholesale power to four Alaskan utilities, providing approximately 5% of Anchorage's and 80% of Juneau's power requirements. The project facilities include dams, reservoirs, powerplants, transmission systems, and necessary maintenance facilities.

Alaska Power Administration is in the process of implementing the Alaska Power Administration Asset Sale and Termination Act (Public Law 104-58). The law authorizes the sale of the Alaska Power Administration assets. However, Congressional approval is still needed for the use of tax-exempt bonds to finance the purchase of the Snettisham Project. This budget request is to provide continued operation and maintenance of both projects during Federal ownership. If the transfers take place before the end of FY 1997, any unobligated appropriations will be returned to the Treasury of the United States according to Alaska Power Administration Asset Sale and Termination Act.

The GOALS of the Alaska Power Administration are to:

1. Maximize energy production in an efficient, reliable, safe, and environmentally-sensitive manner for our customers, and minimize long-term costs while protecting the Federal investment.

2. Operate, maintain, and market power from Eklutna and Snettisham in accordance with authorizing legislation and continuing full utilization of each Projects' energy and peaking capabilities.

The OBJECTIVES related to these goals are:

1. To PROVIDE TRAINING for employees to enhance marketability.

2. To MAXIMIZE ENERGY PRODUCTION by operating both projects in an efficient, reliable, safe, and environmentally-sensitive manner, while protecting the Federal investment;

3. To PERFORM ALL NECESSARY MAINTENANCE to project facilities.

4. To ENHANCE PUBLIC USE OF PROJECT LANDS AND FACILITIES via visitation, reservoir recreation, cooperation with the Alaska Department of Fish and Game in salmon production at Snettisham, and cooperation with the Cook Inlet Aquaculture Association's fish hatchery and Municipality of Anchorage's water supply projects at Eklutna.

EMERGENCY FUND

The FY 1997 request assumes $200,000 in emergency funds appropriated by Congress in FY 1984 to ensure continuity of service will remain available in FY 1997 for that purpose. In the event the use of emergency funds is necessary in FY 1997, immediate restoration of the fund will be requested to maintain operation of APA's financial flexibility to respond to unplanned events.

* Due to enactment of Public Law 104-58, activities that would normally have been operation and maintenance activities are now considered being in direct support of APA's transition. These normal operation and maintenance costs are included in Program Direction for FY 1997. APA also anticipates an increase in turnover due to the enactment of Public Law 104-58. APA will need to obtain normal operation and maintenance services from other Federal and private sector agencies to deal with the increase in turnover.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
ALASKA POWER ADMINISTRATION

OPERATION AND MAINTENANCE

I. Mission Supporting Goals and Objectives:

In past years, Alaska Power Administration's (APA) operation and maintenance program has insured that the two projects generate and transmit reliable electric power in a clean and environmentally safe yet cost-effective manner. This has been achieved by maintaining the power plants and transmission lines at or above industry standards, mitigation of adverse environmental impacts by design and monitoring programs, and performing clean-up of existing problems. Training is provided in the areas of safety and environmental matters so that our staff can perform at their best in a cost efficient manner.

As of September 30, 1995, the projects represent a cumulative Federal investment, including replacements, of $208,462,049. Through FY 1995, $44,262,551 has been repaid in addition to $77,019,172 in interest.

Continued operation and maintenance of the projects remains the priority.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Operation and Maintenance	$ 3,404	$ 1,052	$ 0	$ -1,052	-100%
Total, Operation and Maintenance	$ 3,404	$ 1,052	$ 0	$ -1,052	-100%

III. Performance Summary:

FY 1995 Accomplishments:

- Continued maintenance, replacement, and improvement programs at both Eklutna and Snettisham Projects facilities.
- Completed the emergency tower relocation associated with the FY 1994 landslide at the Snettisham project.
- Procured replacement stator cores, stator windings and field windings to begin the Eklutna unit winding replacement program.
- Provided net-billing arrangements to cover costs of non-Federal operators and routine transmission line maintenance at both Eklutna and Snettisham Projects.

FY 1996 Accomplishments (to date and planned):

- Continuation of maintenance, replacements, and improvements at each of the project facilities, including the Eklutna unit winding replacement program.
- Maintain reliability, efficiency, and safety of the power systems.
- Perform right-of-way clearing and repairing of concrete in the Crater Lake power tunnel.
- Continue net-billing arrangements to cover costs of non-Federal operators and routine transmission line maintenance at both Eklutna and Snettisham Projects.

Explanation of Funding Decrease from FY 1996 to FY 1997:

- FY 1997 reflects a decrease of $1,052,000, for a total of $0. Due to the enactment of Public Law 104-58, activities that would normally have been operation and maintenance activities, are now considered being in direct support of APA's transition. All these normal operation and maintenance costs are included in Program Direction.

PROGRAM DIRECTION

I. Mission Supporting Goals and Objectives:

Program direction provides overall mission implementation and support for Alaska Power Administration's (APA) Operations and Maintenance programs to ensure that all activities are conducted in an environmentally safe manner at the lowest possible cost in accordance with sound business principles and general administration and support of APA's power marketing program.

Program direction has been grouped into four categories:

- Salaries and Benefits provides for funding a staffing level of 34 Full-Time Equivalents. This will provide the staffing level that will allow for normal operations and maintenance activities at both Projects for FY 1997. APA's actual staffing levels will depend on the effectiveness of APA and DOE's employee placement assistance and when the Projects transfer to non-Federal ownership. Congressional approval is still needed for the use of tax-exempt bonds to finance the purchase of the Snettisham Project.

- Travel provides for funding the transportation of Government employees, their per diem allowances and other incidental expenses related to travel for official business. It consists of travel away from official duty stations and local travel and transportation of persons. Various travel includes site visits, information meetings, training, presentations, conferences, relocation moves, etc.

- Support Services provides for funding of contractual services and related supplies and materials in support of administrative functions.

- Other Related Expenses costs of space rental, communications, utilities and miscellaneous charges, printing, training, tuition, contract services, financial audit of APA, operation and maintenance of equipment, supplies and materials, and equipment.

II. Funding Schedule:

Program Direction	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salary and Benefits	$2,342	$0	$2,474	$2,474	$2,446
Travel	250	0	261	261	198
Support Services	290	0	296	296	451
Other Related Expenses	206	0	177	177	905
Total	$3,088	$0	$3,208	$3,208	$4,000
Full-Time Equivalents	30	0	35	35	34
Average	$103	$0	$92	$92	$118
Adjustment	0	0	0	0	0
Budget Authority	$3,088	$0	$3,208	$3,208	$4,000

Alaska Power Administration is in the process of implementing the Alaska Power Administration Asset Sale and Termination Act (Public Law 104-58). The law authorizes the sale of the Alaska Power Administration assets. However, Congressional approval is still needed for the use of tax-exempt bonds to finance the purchase of the Snettisham Project. This budget request is to provide continued operation and maintenance of both projects during Federal ownership. If the transfers take place before the end of FY 1997, any unobligated appropriations will be returned to the Treasury of the United States according to Alaska Power Administration Asset Sale and Termination Act.

III. Performance Summary:

FY 1995 Accomplishments:

- Continued maintenance programs at both Eklutna and Snettisham Projects facilities.
- Provided full range of administrative and management services in support of power operation, maintenance, and marketing functions.
- Installed Eklutna's main power transformers.
- Marketed 389 GWH of clean renewable hydroelectric energy providing total proprietary receipts of $9,437.00.
- Emphasized environmental, safety, and health programs by providing the compliance activity, proper waste management, training, and equipment necessary to comply with current regulations.
- Fully allocated all energy from both APA projects by completing negotiations with customers to renew long-term wholesale power contracts with all customers and signing a wholesale contract for surplus power from the Snettisham project.

FY 1996 Accomplishments (to date and planned):

- Continuation of maintenance at each of the project facilities.
- Provide full range of administrative and management services in support of power operation, maintenance, and marketing functions.
- Market 416 GWH of clean renewable hydroelectric energy providing total proprietary receipts of $10,302.00.
- Continue cost-effective cooperative agreements for shared air charter services to Snettisham to cover costs of non-Federal operators and routine transmission line maintenance at both Eklutna and Snettisham Projects.

1486

FY 1997 Planned Accomplishments:

- Continue normal operation and maintenance at each of the project facilities to maintain the efficiency, reliability, and safety of the power systems until the Projects are transferred to the new owners.
- Continue the maintenance backlog reduction program at both facilities.
- Market 394 GWH of clean renewable hydroelectric energy providing total proprietary receipts of $8,155.00.
- Provide employee training, career counseling, assistance in placement, severance, relocation and retention as appropriate.
- Continue the full range of administrative and management services in support of power operation, maintenance, and marketing functions. This includes the Administrator's Office and staff work in support of the proposed divestiture. The request also provides for management of the environmental, safety and health programs at APA. The request is sufficient to assure compliance with the CFO Act requirements.

IV. Explanation of Funding Increase from FY 1996 to FY 1997:

FY 1997 reflects an increase of $792,000, for a total of $4,000,000 to provide funding at the most minimal level possible for maintenance of the projects. Detailed as follows:

- Decrease of $28,000 in salaries and benefits is due to the net result between cost of living increase, overtime, loss of Full-Time employee, and unfilled vacancies.
- Decrease of $63,000 in travel costs is the result of less employees requiring travel funding and no air charter contract.
- Increase of $155,000 in Support Services is the result of more contracting out due to less staff.
- Increase of $728,000 in Other Related Expenses reflects the enactment of Public Law 104-58, APA considers normal operation and maintenance costs to be in direct support of APA's transition and is included in program direction. APA also anticipates an increase in turnover due to the enactment of Public Law 104-58. Dealing with this increase in turnover will also increase our FTE related costs. APA will need to obtain normal operation and maintenance services from other Federal and private sector agencies to deal with the increase in turnover. The average FTE costs in FY 1996 represent all salaries and benefits, all travel expenses, and related personnel costs such as space rental, utilities, material and supplies, telecommunications, building maintenance, and equipment.

V. Explanation of Average FTE Costs:

Average FY 1997 FTE cost increase is due primarily to the enactment of Public Law 104-58. APA considers normal operation and maintenance to be in support of APA transition and is including these costs in program direction.

Total Proprietary Receipts	$9,437	$10,302	$8,155	$8,560	$8,488	$8,412	$8,395
Percent of sales to preference customers	37%	39%	34%	39%	39%	38%	38%
Energy Sales and Power Marketed (in billions of kilowatt hours)	0.4	0.4	0.4	0.4	0.4	0.4	0.4

FY 1995 net billing amount of $1,130K includes $530K for normal operations and maintenance activities and $600K to complete the Snettisham 12/2 Transmission Line Landslide work.

FY 1996 increase in net billing to $842K from $542K and the increase in FY 1997 net billing to $2,500K is in anticipation of performing Snettisham operations and maintenance through a net billing contract. APA is in the process of determining whether the local utility is receptive to this proposal.

Pending the passage of necessary legislation authorizing the use of tax-exempt financing for the purchase of the Snettisham Project, and the actual transfer dates of the Eklutna Project and the Snettisham Project, Receipt estimates will be revised accordingly.

Bonneville Power Administration

1490

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
BONNEVILLE POWER ADMINISTRATION

PROPOSED APPROPRIATION LANGUAGE

Expenditures from the Bonneville Power Administration Fund, established pursuant to Public Law 93-454, are approved for construction of Eastern Canadian Intertie (Coulee-Oliver) facilities and for official reception and representation expenses in an amount not to exceed $3,000.

During fiscal year [1996] 1997, no new direct loan obligations may made.

EXPLANATION OF CHANGE

Proposed FY 1997 appropriation language provides express approval by Congress for the initiation of construction of "major transmission facilities" (Coulee-Oliver, which will provide transmission facilities that are required for returning the Canadian entitlement power to Canada under the 1964 Columbia River Treaty) as required by sections 3 and 4 of Public Law 93-454, the Federal Columbia River Transmission System Act of 1974; authorizes official reception and representation expenses in the same amount as FY 1996; and deletes language relating to new direct loans for energy conservation under Public Law 96-501, the Pacific Northwest Electric Power Planning and Conservation Act.

1491

DEPARTMENT OF ENERGY
BONNEVILLE POWER ADMINISTRATION
FY 1997 CONGRESSIONAL BUDGET SUBMISSION

EXECUTIVE SUMMARY

PROGRAM MISSION OVERVIEW

Bonneville Power Administration (BPA) is one of the Department of Energy's electric power marketing administrations. BPA provides electric power (about half of the electricity consumed in the region), transmission (about four-fifths of the region's high voltage transmission capacity), and energy services throughout the Pacific Northwest, a 300,000 square mile service area. BPA markets the power produced at 30 Federal hydroelectric multipurpose dams in the Pacific Northwest by the Corps of Engineers and the Bureau of Reclamation, and acquires non-Federal power and electric energy conservation resources to meet the needs of its customer utilities.

Congress created BPA in 1937 with the Bonneville Project Act, providing BPA's basic statutory utility responsibilities and authorities. In 1974, with the Federal Columbia River Transmission System Act , placed BPA under provisions of the Government Corporation Control Act and provided BPA with "self-financing" authority, allowing BPA to use its revenues from electric rate payers to directly fund all programs and to sell bonds to the US Treasury to finance the region's high-voltage electric transmission system requirements. In 1980, with enactment of the Pacific Northwest Electric Power Planning and Conservation Act ,BPA's utility obligations and responsibilities were expanded to meet requesting utility loads, encourage electric energy conservation and develop renewable energy resources, and protect, mitigate and enhance the fish and wildlife of the Columbia River and its tributaries. In support of these expanded responsibilities, BPA's Treasury borrowing authority was expanded to allow the sale of bonds to finance conservation and other resources and carry out fish and wildlife capital improvements.

BPA receives no annual appropriations from Congress. BPA funds the expense portions of its budget and repays the Federal investment in the Federal Government's Pacific Northwest power system with revenues from electric rates. BPA is authorized to sell bonds to the Treasury up to a cumulative outstanding total of $3.75 billion. Through FY 1995, BPA has returned approximately $12 billion to the Treasury in interest, amortization, and repayment of Federal power generation, operation, maintenance, and construction costs. During FY 1997, BPA plans to pay to the Treasury in full its annual scheduled amortization payment which will be based on the 1996 Supplemental Rate Proposal. Currently, the FY 1997 Treasury payment is estimated to be $835 million, of which $263 million is to repay investment principal. The principal and interest components of this estimate, as well as the total, will be updated following completion of BPA's 1996 Supplemental Rate Proposal and finalized when the rates are filed with the Federal Energy Regulatory Commission. The new rates are expected to be in place at the start of FY 1997.

BPA's FY 1997 budget submission incorporates the budget reductions BPA has made to remain competitive in the electric utility industry in the Pacific Northwest as the industry restructures itself. These spending levels were used to develop the revenue requirement for the 1996 Supplemental Rate Proposal. These estimates are still subject to change due to several reasons, including: 1) continued review of spending levels by BPA, as well as by its customers and constituents as part of the rate case proceedings, 2) potential termination costs of contracts BPA is closing out, and 3) changing fiscal dynamics of ongoing activities and program shifts to remain competitive in the Pacific Northwest's electric utility industry, particularly aspects of BPA's debt repayment, utility structure and governance, regional conservation goals and regional fish and wildlife challenges.

BPA STAFFING (FTE)	3,313	3,272	3,272

FY 1997 PERFORMANCE OBJECTIVES

- Produce gross revenues of $ 3.3 billion from the $ 13 billion FCRPS investment, and repay US treasury $ 835 million.
- Obligate $ 287 million in new capital investments for transmission services, conservation and renewable energy resources, and F&W.
- Sell about 75,000,000 megawatt-hours of electricity and wheel and exchange an additional 75, 000,000 megawatt-hours of electricity.
- Operate and maintain 14,800 circuit-miles of electric transmission lines, 400 electric substations and associated facilities with 77,000,000 kilovolt-amperes of capacity, and related utility and general plant, with a combined capital investment of $ 5 billion
- Provide and reliably operate about 80 percent of the 300,000 square-mile Pacific Northwest's high-voltage electric energy transmission capacity and work with other regional utilities and others to ensure an effective, efficient power supply sytem.

These performance objectives support BPA's goal to :
Provide electric power, transmission, and energy services in increasingly competitive markets.
Support achievement of BPA fish and wildlife, energy conservation, renewable energy and low-cost power responsibilities.
Remain a low-cost producer and creative, flexible marketer in the PNW, helping ensure the economic and environmental health of the PNW.

a/BPA's FY 1997 budget has been prepared in accord with the Budget Enforcement ACT (BEA) of 1990. Under this Act all BPA budget estimates are mandatory and are not subject to discretionary "caps" in the BEA. These estimates support activities legally separate from discretionary activities and accounts. Thus, changes to BPA estimates cannot be used to affect any other budget categories such as domestic discretionary, or defense discretionary which have their own legal dollar caps. Because BPA operates within existing legislative authority, BPA is not subject to a BEA "pay-as-you-go" test regarding its revision of funding estimates. b/ This estimate reflects BPA's FY 1996 Congressional Budget Submission.

c/ This estimate is consistent with BPA's 1996 Supplemental Rate Proposal, Dec. 1995.

d/ FTE reflect DOE FY 1996/1997 Staffing Budget.

1/ The Associated Project Costs amount in line 7 includes the amortization of Bureau of Reclamation appropriations and irrigation assistance, which are treated as obligations and outlays. Bureau amortization is as follows ($ in millions): $2 in FY 1995, $0 in FY 1996, $15.3 in FY 1997, $6.8 in FY 1998, $ 22.1 in FY 1999, $27.9 in FY 2000 and $51.4 in FY 2001. Irrigation assistance is reflected as $25.1 in FY 1997 & $10.2 in FY 2001 only. These amortization amounts are subject to change as Bonneville prepares repayment studies for the 1996 Rate Case.

2/ Bonneville's total obligations as displayed above are still tentative and subject to change since BPA has not yet completed work for the 1996 rate case.

3/ The cash amount for total revenues and reimbursements for FY 1995 includes the receipt of $156 million from the Non-Federal participants in the Third AC Transmission line. The accrual amounts for FY 1996-2000 include 1/46th of this amount, $3.5 million per year, to reflect how these funds will be included in financial statements.

4/ BPA's FY 1997 budget has been prepared in accordance with the Budget Enforcement Act (BEA) of 1990. Under this Act all BPA budget estimates are treated as mandatory and are not subject to the discretionary caps included in the BEA. These estimates support activities which are legally separate from discretionary activities and accounts. Thus, any changes to BPA estimates cannot be used to affect any other budget categories which have their own legal dollar caps. The FY 1997 budget reflects the impact of passage of the Colville Settlement legislation.

1/ BPA's FY 1997 budget has been prepared in accordance with the Budget Enforcement Act (BEA) of 1990. Under this Act all BPA budget estimates are treated as mandatory and are not subject to the discretionary caps included in the BEA. These estimates support activities which are legally separate from discretionary activities and accounts. Thus, any changes to BPA estimates cannot be used to affect any other budget categories which have their own legal dollar caps. Because BPA operates within existing legislative authority, BPA is not subject to a Budget Enforcement "pay-as-you-go" test regarding its revision of funding estimates.

2/ Borrowing Authority to Finance Other Obligations represents the use of (positive), or building up of (negative), deferred borrowing. Deferred borrowing is created when Bonneville uses cash from revenues to liquidate capital obligations in lieu of borrowing. This temporary use of cash on-hand instead of borrowed funds creates the ability in future years to borrow money, when fiscally prudent, to liquidate revenue funded activities. The amount on this line, under the title "Borrowing Authority to Finance Other Obligations" represents the annual use, or creation of deferred borrowing. OMB has requested that Bonneville show this deferred borrowing as resource carried forward from year to year in the manner displayed here. It is important to note that the borrowing authority amount on line 17 "Borrowing Authority to Finance Capital Obligations" is the amount which is tracked by the Congressional Committees.

SUMMARY OF CHANGES IN CAPITAL COMMITMENTS AND BORROWING AUTHORITY, FY 1996 TO FY 1997

(in thousands of dollars)

FY 1996 New Borrowing Authority 1/	377,000
Recent cost reductions	(22,000)
FY 1996 Capital Investments (current estimate)	355,000
Marketing, Conservation & Production:	(51,000)
- Decreased funding of centrally designed programs resulting in greater sharing of costs with regional utilities	
Transmission Services:	(2,000)
- Increased level of Area and Customer Service and Main Grid activity	
- Decreased level of Upgrades and Additions, and System Replacements due to cost reduction and efficiency activities	
- Increased AFUDC due to higher level of construction work in progress	
Associated Projects Capital:	(13,000)
- Decreased funding levels due primarily to cost reduction and efficiency activities	
Environment/Fish and Wildlife:	(1,000)
- Continue funding at approximately same levels	
Capital Equipment:	(1,000)
- Decreased level of funding due to cost reduction and efficiency activities	
FY 1997 New Capital Commitments	287,000
FY 1997 New Borrowing Authority	287,000

1/ This estimate is consistent with the FY 1996 Appropriations Act

BONNEVILLE POWER ADMINISTRATION

PROGRAM MISSION

The Bonneville Power Administration (Bonneville) provides electric power, transmission and energy services throughout the Pacific Northwest. Created in 1937 to market and transmit the power produced by the Bonneville Dam on the Columbia River, Congress has since then directed Bonneville to sell at wholesale the power produced at a total of 30 Federal dams, and to acquire non-federal power and conservation resources sufficient to meet the needs of Bonneville's customer utilities. Bonneville serves a 300,000 square mile area including Oregon, Washington, Idaho, western Montana, and parts of northern California, Nevada, Utah and Wyoming.

The Federal Columbia River Transmission Act of 1974 placed Bonneville under the provisions of the Government Corporation Act and allows Bonneville to use its revenue from electric ratepayers to fund all programs directly, and sell bonds to the U.S. Treasury to finance the region's high voltage transmission requirements. The Pacific Northwest Power Act of 1980 expanded Bonneville's utility obligations and responsibilities to meet requesting utility loads, encourage conservation and develop renewable resources, and to protect, mitigate and enhance the fish and wildlife of the Columbia River and its tributaries. In support of these responsibilities, Bonneville's borrowing authority was expanded to allow the sale of bonds to finance conservation and other resources and carry out fish and wildlife capital improvements. This Act also required regional energy plans and programs and created the Northwest Power Planning Council.

Bonneville receives no annual appropriations from Congress. Under the Transmission Act, Bonneville funds the expense portion of its budget and repays the Federal investment with revenues from electric rates. Bonneville's revenues fluctuate primarily in response to market prices for fuels and commodity metals and to weather conditions affecting stream flows in the Columbia River System. Bonneville is authorized to sell bonds to the Treasury up to a cumulative outstanding total of $3.75 billion. Through FY 1995, Bonneville has returned approximately $12 billion to the U.S. Treasury in interest, amortization, and repayment of Federal power generation, operation, maintenance, and construction costs. FY 1995 marked the twelfth consecutive year Bonneville has made its Treasury payment in full and on time. During FY 1997, Bonneville plans to pay the Treasury in full its annual scheduled amortization payment which will be based on the 1996 Rate Case. Currently, the FY 1997 Treasury payment is estimated to be $851 million, of which $263 million is to repay principal. This estimate has been updated as part of Bonneville's 1996 Supplemental Rate Proposal and will be finalized when the rates are filed with the Federal Energy Regulatory Commission. The new rates are expected to be in place by the beginning of FY 1997.

This budget incorporates the budget reductions BPA has made to remain competitive in the electric utility industry in the Pacific Northwest as the industry restructures itself. These spending levels were used to develop the revenue requirement for the 1996 Supplemental Rate Proposal. These estimates are still subject to change due to several reasons including: 1) continued review of spending levels by Bonneville, as well as its customers and constituents, as part of

the rate case proceedings, 2) potential termination costs associated with contracts that Bonneville is closing out, and 3) current ongoing activities concerning several of the items discussed below under Significant Accomplishments and Program Shifts.

The spending estimates that appear at the budget line item of detail in the following Performance Summaries are accrued expenditures. Budget obligations continue to be shown at the program level, however. Managing to and reporting of accrued expenditures allows Bonneville to better control funds, reduce costs, and focus on results that positively impact Bonneville's financial condition and probability of repaying the U.S. Treasury. Bonneville's total forecast obligations that appear on the Program Funding Profile (Lead Table), BP-1 Summary, BP-2 Table and Program and Financing Summary were estimated based on Bonneville's forecast of accrued expenditures.

The GOAL of Bonneville is:

- To provide electric power, transmission, and energy services in increasingly competitive markets.
- To support the achievement of BPA's responsibilities for fish and wildlife, energy conservation, renewable resources, and low-cost power for the region.
- To remain a low-cost producer and a creative and flexible marketer in the region, helping to ensure the economical and environmental health of the Pacific Northwest.
- To value individual diversity, entrepreneurial spirit, personal responsibility and the public service of Bonneville employees.

OBJECTIVES and PERFORMANCE MEASURES:

The objectives and performance measures listed here address the key areas of Bonneville's business and are based on the measures to be included in the FY 1995 Annual Management report as well as Bonneville's 1995 Business Plan.

Objective 1. Achieve high and continually improving customer satisfaction:
Performance Measure 1a. Improving customer overall satisfaction targets as measured by customer surveys.
Status: Conducted two customer surveys, one in FY 1993 and one in FY 1995.

Objective 2. Increase the value of our business and share the expanded benefits.
Performance Measure 2a. Net revenues for BPA as measured by quarterly financial statements.
Status: Historical data through FY 1995.
Performance Measure 2b. Business line margins as measured by business line reports.
Status: Comparison of targets and actuals for FY 1995.
Performance Measure 2c. Number of megawatts of conservation acquired as reported by utilities.
Status: Historical data through FY 1995.
Performance Measure 2d. Improving constituent overall satisfaction as measured by constituent surveys.
Status: Conducted first constituent survey in FY 1995.

Objective 3. Be the lowest-cost producer of power and transmission services.
Performance Measure 3a. Overall average system cost as compared to others in the region.

Status: Target and actual BPA priority firm (PF) rate for FY 1995 and target for 1996 and beyond.

Objective 4. Achieve and maintain financial integrity.
Performance Measure 4a. Progress toward targeted financial reserves.
Status: Combination of historical data and target through FY 1995.

Objective 5. Keep the power system safe and reliable.
Performance Measure 5a. Recordable injury rate.
Status: Combination of historical data and target through FY 1995.
Performance Measure 5b. Beat competitive benchmark for system average interruption frequency index (SAIFI).
Status: Combination of historical data and target through FY 1995.
Objective 6. Invest in environmental results to sustain competitiveness.
Performance Measure 6a. Fish and wildlife program results for anadromous fish, resident fish, wildlife, and program costs.
Status: Developing methodologies and targets.

Objective 7. Transform Bonneville into a high-performing, business-oriented organization.
Performance Measure 7a. Cultural results showing employees owning the business, developing mutually beneficial customer/client relationships, and striving for workforce excellence and a work environment that supports everyone's success.
Status: Conducted two cultural audits of employees, one in FY 1993 and one in FY 1995.

These objectives present a long-term focus which is designed to position Bonneville for the future. As BPA continues to respond to evolving competitive market conditions, both the objectives and performance measures are subject to change in order to maintain their relevance to management decisions.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS.

Bonneville is currently conducting the formal process of its 1996 rate case and has included updated interest and amortization estimates in its FY 1997 Congressional Budget submittal from its 1996 Supplemental Rate Proposal in December 1995. Bonneville has put forward in this Supplemental Rate Proposal assumed revenue financing of a portion of its capital investments, in an effort to reduce its reliance on debt financing. Bonneville expects the new rates to be in effect at the beginning of FY 1997.

Bonneville faces unprecedented challenges in continuing its service to the Pacific Northwest. Market prices falling to near parity with Bonneville's rates have brought new competition, while at the same time the costs of Bonneville's commitment to rebuild salmon runs have risen sharply. These forces have converged to reshape Bonneville's marketing, planning , and organization.

BPA is seeking to be competitive, the supplier of choice to its customers, and responsive to its regional responsibilities in a time of change and instability in the region's economy and its electric utility industry. Stability is critical now as the Pacific Northwest embarks on a comprehensive Regional Review of its regional electric system, a system in which BPA is a major player. BPA's stability will enable the region to make reasoned decisions rather than crisis-driven decisions.

Bonneville is committed to succeeding in the new competitive market. A new organizational structure focuses on meeting customers' needs. Cost management has become an essential tool for maintaining Bonneville's competitiveness. All spending and development plans have been closely reviewed, and a number of planned projects have been postponed or canceled. Bonneville is reducing its human resources staffing, Federal full-time-equivalent employment and contract support services employment equivalent, by nearly 20 percent from levels of mid-Fiscal Year 1994. For FTE, BPA's March 1994 baseline for FY 1994 was the number of filled positions (permanent and temporary, full and part-time, including student programs charged against FTE allocations) whose incumbents were actually on board and charging against BPA FTE. BPA identified this as baselines for both employment and FTE. The contractor FTE baseline was the dollar-derived FTE equivalent of actual FY 1994 support services and related contract costs. In addition, Bonneville has explored options to reduce its level of debt financing in order to both delay exhaustion of borrowing authority caps and improve Bonneville's debt-equity position. The options for implementation include 1) further reductions in capital spending through application of a capital budgeting process, 2) revenue financing of roughly $30 million of transmission capital per year, 3) to the extent allowable, shifting costs from the Transmission/Fish & Wildlife authority to the Conservation authority, and 4) using alternative sources of capital, including the use of third-party financing to the greatest extent possible.

As part of its competitiveness efforts, Bonneville released a 1995 Business Plan. The Business Plan is a broad outline of Bonneville's strategy for the future. It combines many of Bonneville's competitiveness initiatives with a focus to enable Bonneville to continue to fulfill its public mission in the changing utility market. Broad goals and strategic business objectives for transforming all aspects of Bonneville's enterprises are identified in the Plan and are included under the Objectives and Performance Measures section of this budget document as well. The Business Plan sets policy direction for Bonneville's pricing, power marketing, transmission, conservation, and fish and wildlife activities. The Business Plan is supported by a Business Plan Environmental Impact Statement issued in June 1995. Included in the Business Plan are objectives and critical success indicators used to develop the performance indicators included in this document and in the FY 1995 Annual Management Report.

One of the most pressing environmental challenges facing the Northwest is the serious decline in Columbia Basin wild salmon stocks. The decline in these species is evidenced by listings of the Snake River Sockeye Salmon, Snake River Chinook Salmon, Redfish Lake Sockeye Salmon, and the Kootenai River

White Sturgeon as endangered under the Endangered Species Act. Since 1980, Bonneville ratepayers have spent over $1 billion to mitigate fish and wildlife impacts associated with the construction and operation of the Federal hydroelectric projects on the Columbia River System. At the end of this mission statement is a fish and wildlife investments crosscut presentation of the history and forecast of BPA's fiscal and economic support of fish and wildlife support. In less than five years, Bonneville's annual costs for fish and wildlife, including foregone revenues, have risen from $150 million to about $400 million a year, including capital expenditures, purchase power and lost revenues. In addition, significant Endangered Species Act required changes in the operation of the hydropower system have reduced operating flexibility and further curtailed revenues. In response to these events, Bonneville has reinvented its fish and wildlife program to emphasize greater results, cost-effectiveness, and efficiency. In addition, an amendment was included in the 1996 Senate Energy and Water Development Appropriations relating to Bonneville's and the region's salmon recovery efforts. Included in the legislation is a provision that the Pacific Northwest Planning Council conduct a review and report to Congress by May 1996, recommending ways to improve effective regional control over efforts to conserve and enhance anadromous and resident fish and wildlife within the Federal Columbia River Power System.

Related to this, in March 1995, the Administration completed an agreement with U.S Senators Mark Hatfield, Patty Murray, and Max Bacus and other members of the Northwest Congressional Delegation. This agreement recognized BPA's use of Section 4(h)(10)(C) of the Northwest Power act to apply credits to BPA's Treasury payment for previous BPA expenditures attributable to non-power hydro project costs collected through BPA power rates. Under the agreement, BPA is able to access historical credits, and the availability of credits is extended for BPA's power purchase costs relating to its fish and wildlife programs in Fiscal Years 1997-2001.

In October 1995, the OMB in a letter to Congress, reiterated and extended the Administration's commitments made earlier, and described a "program" for the period FY 1996-2001 intended to provide greater financial certainty to BPA and its customers for fish and wildlife obligations, while ensuring stable funding at levels needed to implement the 1995 Biological Opinion of the National Marine Fisheries Administration and other objectives under the Endangered Species Act, and the Pacific Northwest Power Planning Council's Fish and Wildlife Program initiatives. A key element of the program is the fish "cap" of BPA's annual fish costs at an average level no more than $435 million per year over the next 6 years assuming average hydro conditions and other related circumstances.

1514

BPA remains committed to meeting its share of the regional conservation targets set by the Northwest Power Planning Council. BPA is moving to an approach that supports utilities in setting up their own programs. BPA will provide demand-side management products and energy services and "market transformation" activities-- collaborative ventures with regional and national organizations to move the market place toward more energy-efficient products and practices. To the extent that its customers' acquisitions fall short of the Council's regional goals, BPA will develop programs to meet those goals.

More than $3 billion has been invested in Bonneville's high voltage transmission system, providing about eighty percent of the Pacific Northwest region's electric power transmission capacity. Protecting this government investment and meeting new demands due to changing customer load requirements require Bonneville to maintain and reinforce its extensive installed facilities for continued reliable, safe service to its utility and industrial customers.

Bonneville is adopting a reliability-centered maintenance (RCM) philosophy. This philosophy is a significant departure from traditional equipment-centered practice and will improve the transmission system's reliability while substantially reducing preventive maintenance program costs. Planned system replacements meet the objectives of (1) replacing high-risk, obsolete, and maintenance-intensive facilities and equipment and (2) minimizing occurrences of catastrophic equipment failure at critical sites. This is cost- effectively accomplished through system maintenance organizations' examining transmission components, including component maintenance records, and recommending replacement at or near the end of the component's expected useful life. This approach to component replacement will be managed to the extent that system outage frequencies/durations continue to be within acceptable limits.

All capital improvements--whether replacements, upgrades, or additions to reinforce specific portions of the transmission system--are planned under a new restrictive criteria, with each facility evaluated on expected financial, reliability, and safety benefits before being authorized.

Bonneville Power Administration and the U. S. Army Corps of Engineers, as the U.S. Entity under the Columbia River Treaty, were involved in negotiations with the Canadian Entity (BC Hydro) and the British Columbia government to find a mutually beneficial arrangement to deliver Canadian Entitlement power to Canada, beginning in 1998. Last September, representatives of the Canadian Entity, the BC government and the U.S. Entity signed a non-binding memorandum that laid out principles for detailed negotiations. However, due to the rapidly changing economic conditions in the utility industry, the U. S. Entity decided to withdraw from these negotiations based on the need to protect the economic interests of its customer utilities and the regional ratepayers. The U. S. Entity remains open to the possibility of restarting negotiations at a future date to attempt to reach a mutually satisfactory agreement for delivery of Canadian Entitlement power. Budget estimates, starting in FY 1996, and necessary authorizing language in the Appropriation Language sheet are included for the Eastern Canadian Intertie (Grand Coulee Dam to the Canadian Border 'Oliver') facility. This facility will provide transmission facilities that are required for returning the Canadian Entitlement power to BC Hydro, under the 1964 Columbia River Treaty, and will increase power transfer capability between the U.S. and Canada.

DEPARTMENT OF ENERGY
BONNEVILLE POWER ADMINISTRATION

Notes - Fish and Wildlife Investments Crosscut Tables
Fiscal Years 1978 through 1995

These notes support three tables that display the Pacific Northwest electric utility ratepayers' investment in fish and wildlife activities within the Columbia River Basin. The tables represent the annual expense for all fish and wildlife investments funded under the Federal Columbia River Power System from a rate making, revenue requirement perspective for the period Fiscal Years (FY) 1978 to 1995. Where audited actuals are not available in this period, best estimates are used. The three tables cover the following periods: Table 1 - FY 1978 through FY 1984, Table 2 - FY 1985 through FY 1990, and Table 3 - FY 1991 through FY 1995.

The costs shown in the tables are based on budget outlays (rather than obligations) for the year shown. The title "Capital Investments," shown at the top of the table, is presented for information only. The annual expense (interest, amortization, and depreciation) associated with these capital investments is shown under the title "Program Related Fixed Expenses."

BPA has a mandate, under the Pacific Northwest Electric Power Planning and Conservation Act (Northwest Power Act), to undertake activities to enhance and support fish and wildlife resources adversely affected by the hydroelectric development of the Columbia River Basin. Under the Act, the Northwest Power Planning Council has established a fish and wildlife program that oversees regional efforts to improve fish and wildlife survival. In conjunction with the Power Planning Council, affected states within the BPA service area, public agencies and Indian tribes, BPA identifies opportunities for effective actions to restore habitat and support fish and wildlife population, and provides funding for those activities.

BPA also has a mandate to implement measures called for under the Endangered Species Act. These measures are part of the Biological Opinions (BO) issued by the National Marine Fisheries Service (NMFS) and the U.S. Fish and Wildlife Service (USFWS) regarding the operations of the Federal Columbia River hydro electric system. The expenses associated with the calendar year (CY) 1995 NMFS BO, addressing measures regarding listed salmon species, and the CY 1995 USFWS BO, addressing measures concerning Kootanai River sturgeon and certain Snake River snails, are reflected in the tables.

BPA funding of the Power Planning Council's Fish and Wildlife Program measures and measures called for under ESA, starting in FY 1992, has increasingly become interrelated and as such, difficult to separately track. As a result, the ESA activities reported under the heading "BPA Direct Fish and Wildlife Program" will no longer be separated in forecasts that extend beyond the budget year.

BPA has a direct program "budget" that is the source of funding the Council's Fish and Wildlife Program and certain ESA measures called for in Biological Opinions. This budget is reflected in these tables under two headings. The first is under "Capital Investments" for fish and wildlife, and the second is under "Program Operating Expenses" for BPA fish and wildlife program. (Because these tables present a "revenue requirement" view of BPA's overall fish and wildlife annual investment, only the fixed expenses of the capital investment are included in the total, as noted above.)

Adjustments for implementation of Section 4(h)(10)(C) of the Northwest Power Act for FY 1994 and FY 1995 are $18.7 million and $56.3 million, respectively, are not reflected in Table 3. The Section 4(h)(10)(C) credits were received against BPA's FY 1994 and FY 1995 Treasury repayment. The credit reflects implementation of Section 4(h)(10)(C) which calls for a portion of BPA's fish and wildlife expenses to be allocated to the other purposes of the Federal projects in the Columbia River Basin. Analysis has determined that the BPA's power share is 73 percent and the taxpayer's share is 27 percent.

316

- The tables represent a "revenue requirement" view of BPA's fish and wildlife funding responsibilities except for foregone revenues. All expenses in these tables are paid for by BPA's ratepayers.
- Power purchases and foregone revenues for FY 1994 reflect the measures contained in the CY 1994 National Marine Fisheries Service's (NMFS) Biological Opinion issued March 16, 1994, pursuant to the Endangered Species Act (ESA). Estimates for FY 1995 reflect the average of 50 water year conditions and reflect

the measures contained in the NMFS Biological Opinion issued March 2, 1995, pursuant to ESA. The estimated expenses for FY 1995 are split 50/50 between power purchases and foregone revenues. A detailed accounting of FY 1995 expenses is not complete at this writing but should be included in later updates to Table 3. A format change in the display of the Power Purchases for Fish Enhancement and Foregone Revenues occurs starting in FY 1994 to better reflect NMFS Biological Opinion elements.

Footnotes

1/ Based on outlays. The BPA Program Expenses - ESA for the period FY 1991 through FY 1995 reflect funding specifically mandated by ESA and also those expenditures that, while not specifically mandated, are intended to assist in the recovery of ESA-listed species. Examples of these projects are the squawfish predator control program and the Kootanai River sturgeon program.

2/ Based on plant-in-service as reported by the Corps of Engineers. Through FY 1977, cumulative plant-in-service is estimated at $165 million. A review of these annual estimates is planned and may result in restatements of annual plant-in-service and resulting adjustments in Program Related Fixed Expenses.

3/ Expenses through FY 1991 are for Water Budget only. ESA implementation began in FY 1992 in anticipation of NMFS listings that led to a Biological Opinion that was issued in calendar year (CY) 1993.

4/ In FY 1993, estimates reflect the CY 1993 NMFS Biological Opinion.

5/ The FY 1994 estimates reflect the measures contained in the 1994 NMFS Biological Opinion issued March 16, 1994. Estimates for FY 1995 reflect NMFS Biological Opinion issued March 2, 1995, and are the average of 50 water year conditions. As noted above, accounting is not complete on FY 1995 hydro operations. Effective in FY 1994, these expenses are displayed with greater detail, consistent with categories identified by NMFS in the Biological Opinion.

6/ The estimate for FY 1994 reflects CY 1994 NMFS Biological Opinion spill levels April 10, 1994, through the migration period. It also reflects emergency spill measures implemented by NMFS May 11, 1994 through June 20, 1994.

7/ The estimate for FY 1994 reflects CY 1994 NMFS Biological Opinion flow augmentation volumes plus the additional releases from Dworshak (to elevation 1490 feet) and Upper Columbia reservoirs (1.33 MAF).

8/ Associated Projects costs reflect the power share of the fish and wildlife O&M reimbursed to the Treasury. The amounts shown are based on estimates of the agency, adjusted for actuals by BPA where data is available. (Prior versions of these tables included a line representing estimates for "ESA" related expenses for FY's 1992 and 1993. This sub-category has been removed because expenses are not separately reported to Bonneville, although ESA expenses are assumed to be imbedded in the expenses of the Federal agencies [excluding the Council which has no ESA related expenses.])

9/ Interest expense includes BPA's interest on bonds (for fish and wildlife) and interest on the Corps of Engineers (Federal) investment in fish and wildlife assigned to the power purposes of the Federal projects. Amortization reflects BPA's bonds and depreciation reflects the Federal investment in fish and wildlife. These amounts include expenses for interest during construction on federal investments.

10/ "ESA drawdown" includes operations of the four Lower Snake River dams at near minimum operating pool elevations and John Day Dam at minimum irrigation pool, as in 1992. Other drawdown proposals being studied include physical changes to the Lower Snake River dams. These proposals would result in significantly higher costs and are not included in either the ESA drawdown or reduced forebay levels in these tables.

THE ACCOMPANYING NOTES ARE AN INTEGRAL PART OF THIS TABLE.

DEPARTMENT OF ENERGY
BONNEVILLE POWER ADMINISTRATION
FY 1997 CONGRESSIONAL BUDGET
Notes - Fish and Wildlife Investments Crosscut Table
Fiscal Years 1996 through 2001

These notes support the display of the Pacific Northwest electric utility ratepayers' planned investment in fish and wildlife activities within the Columbia River Basin. The table represents a forecast of the annual expense for all fish and wildlife investments funded under the Federal Columbia River Power System (FCRPS) from a rate making, revenue requirement perspective for the period Fiscal Years (FY) 1996 to 2001. The forecast reflects, and is consistent with, the fish and wildlife budget agreement announced by the Administration in October 1995, that calls for Bonneville's fish and wildlife expenses to average $435 million per year for the period FY 1996 - FY 2001. The details regarding the implementation of the budget agreement will be developed as an interagency agreement among the affected Federal agencies (Bonneville, National Marine Fisheries Service (NMFS), Corps of Engineers, and the Department of the Interior) in consultation with the Northwest Power Planning Council (Power Planning Council) and the Tribes.

The costs shown in the table are assumed to be budget outlays (obligations equal outlays) for the years shown. The title "Capital Investments," shown at the top of the table, is presented for information only. The annual expense (interest, amortization, and depreciation) associated with these capital investments is shown under the title "Program Related Fixed Expenses."

Bonneville has a mandate, under the Pacific Northwest Electric Power Planning and Conservation Act (Northwest Power Act), to undertake activities to enhance and support fish and wildlife resources adversely affected by the hydroelectric development of the Columbia River Basin. Under the Act, the Power Planning Council has adopted a Fish and Wildlife Program that oversees Columbia River basin-wide efforts to improve fish and wildlife survival. In conjunction with the Power Planning Council, affected states within the Bonneville service area, public agencies and Indian tribes, BPA identifies opportunities for effective actions to restore habitat and support fish and wildlife population, and provides funding for those activities.

Bonneville also has a mandate to implement measures called for under the Endangered Species Act (ESA). These measures are part of the Biological Opinions (BO) issued by NMFS and the U.S. Fish and Wildlife Service (USFWS) regarding the operations of the Federal Columbia River hydro electric system. The expenses associated with the calendar year (CY) 1995 NMFS BO, addressing measures regarding listed salmon species, and the CY 1995 USFWS BO, addressing measures concerning Kootanai River sturgeon and certain Snake River snails, are reflected in the table. As the other Federal agencies (that are part of the FCRPS) implement actions called for in the BO's, these expenses will also become part of Bonneville's repayment responsibilities as the costs are assigned to the power purposes of the Federal projects.

Bonneville funding of the Power Planning Council's Fish and Wildlife Program measures and BO measures called for under ESA, beginning in FY 1992, have increasingly become interrelated and as such, difficult to separately track. As a result, the ESA activities reported under the heading "BPA Direct Fish and Wildlife Program" are not separated in out-year forecasts that extend beyond the budget year FY 1997.

Bonneville's direct program "budget" is the source of funding the Council's Fish and Wildlife Program and certain ESA measures called for in the BO's. The ESA expenses identified in this table for FY's 1996 and 1997, include both expenditures specifically mandated by ESA and also those expenditures that, while not specifically mandated, are intended to assist in the recovery of ESA-listed species.

Bonneville's direct fish and wildlife budget is reflected in this table under two headings. The first is under "Capital Investments - BPA Fish and Wildlife" and reflects the capital portion of the direct budget. The second is under "Program Operating Expenses - BPA Direct Fish and Wildlife Program" and reflects the expense portion of the direct budget. (Because this table presents a "revenue requirement" view of Bonneville's overall fish and wildlife annual expense, only the fixed expenses associated with the capital investments are included in the total, as noted above.)

Within Bonneville's direct program, priority for funding will focus first on implementing the reasonable and prudent alternatives contained in the NMFS and USFWS BO's and second, on measures implementing the Power Planning Council's Fish and Wildlife Program. A current goal of the Power Planning Council, and one supported by Bonneville, is that all projects funded under both Bonneville's direct program as well as the reimbursable and capital investment components of the other Federal agencies (as reflected in the table) will be reviewed and prioritized as part of a Power Planning Council initiated process. It is anticipated that such a process will be examined and considered as part of the Power Planning Council's 180-day review of governance for fish and wildlife within the FCRPS as called for in the FY 1996 Energy and Water Appropriations Act.

- Treasury credit adjustments for implementation of Section 4(h)(10)(C) of the Northwest Power Act are not reflected in the table. Bonneville will receive $50 million to $60 million a year as a Treasury credit to account for impacts on fish and wildlife of the nonpower purposes of the region's Federal hydro electric projects. An additional $325 million in retroactive Treasury credit funds will be made available to Bonneville in the event of low-water years or court-ordered fish and wildlife spending that exceeds the $435 million. This contingency fund represents money Bonneville ratepayers have already paid for fish and wildlife costs of nonpower uses of Federal hydro electric projects. Section 4(h)(10)(C) credits are based on analysis that shows Bonneville's power share is 73 percent and the nonpower (taxpayer) share is 27 percent.
- The table represents a "revenue requirement" view of Bonneville's fish and wildlife funding responsibilities except for foregone revenues. All expenses in these tables are paid for by Bonneville's ratepayers.
- Power purchases and foregone revenues reflect the average of 50 water year conditions. These expenses reflect operational measures called for in the CY 1995 National Marine Fisheries Service's Biological Opinion and the Power Planning Council's Fish and Wildlife Program (to the extent the Program measures are not in conflict with BO measures).

Footnotes

1/ Based on outlays associated for Bonneville's capital and expense budgets. The total amount shown in each fiscal year is consistent with the fish and wildlife budget agreement of $435 million for the period FY 1996 - FY 2001. ESA expenditures are planned to continue beyond the budget year (FY 1997) but are not separately forecasted at this time.

2/ Based on plant-in-service estimates developed in conjunction with the Corps of Engineers and Bureau of Reclamation. The amounts shown are consistent with the fish and wildlife budget agreement of $435 million for the period FY 1996 - FY 2001. These plant-in-service estimates reflect capital features that are projected to come on line and become subject to Treasruy repayment by Bonneville under the FCRPS. These estimates do not reflect the COE's annual budget amounts for capital construction.

3/ Expenses are split 50/50 between net power purchases and foregone revenues for display purposes only and are based on the average of 50 water year conditions. Actual expenses will be determined by annual water conditions and the price for power. No attempt has been made at this time to break down the annual estimates into the four sub-categories. The amounts shown are consistent with the fish and wildlife budget agreement of $435 million for the period FY 1996 - FY 2001.

4/ Reimbursable (Associated Projects) costs reflect the power share of the fish and wildlife O&M reimbursed to the Treasury and one-half of the budget estimated for the Power Planning Council. The amounts shown are consistent with the fish and wildlife budget agreement of $435 million for the period FY 1996 - FY 2001. ESA expenditures are assumed to be imbedded in the other Federal agencies O&M (excluding the Council which has no ESA related expenses). These expenses, however, are not separately reported to Bonneville and therefore are not broken out in this table.

5/ Interest expense includes Bonneville's interest on bonds (for fish and wildlife) and interest on the Federal investment in fish and wildlife assigned to the power purposes of the Federal projects. Amortization reflects BPA's bonds and depreciation reflects the Federal investment in fish and wildlife. These amounts include expenses for interest during construction on federal investments. The amounts shown are consistent with the fish and wildlife budget agreement of $435 million for the period FY 1996 - FY 2001.

3/6/96 (Rev. 3/14/96) DByrnes:dmb:3171 (ECB - SB25F2P1)

Overview of Performance Summaries

BPA's Performance summaries are divided into two sections, reflecting their economic character and source of funding.

The first section, Capital Programs, includes accrued expenditures for Bonneville's five capital budget programs providing for capital investments in electric utility and general plant associated with the Federal Columbia River Power System's (FCRPS) transmission services, capital equipment, hydroelectric projects, conservation and capital investments in environment, fish and wildlife. These five programs will require budget obligations and new borrowing authority of $287 million in FY 1997. A sixth category reflects the premium BPA will incur to refinance bonds sold to the Treasury for FCRPS capital investments, whenever BPA makes such refinancing.

BPA's second section of the Performance Summaries, entitled Annual Operating Expenses, includes accrued expenditures for Bonneville's eight expense and capital transfer programs financed by power sales and transmission services revenues and BPA reimbursable activities funded by benefiting entities. For FY 1997, BPA's revenue funded programs will require budget obligations of $3,055 million. Reimbursable activities are budgeted at $18 million and capital transfers are estimated at $263 million for FY 1997.

Since BPA has four budget programs with both capital and expense components (Transmission Services, Marketing, Conservation & Production, Associated Projects, and Environment/Fish & Wildlife), the capital and expense components of these four programs must be combined for total program requirements. The total program requirements of all BPA programs will include estimated budget obligations of $3,360 million in FY 1997.

Amounts shown in the performance summaries for the budget line item entries are accrued expenditures. Totals are shown on both a budget obligation and an accrued expenditure basis. Tabular amounts for performance summary line items are in thousands of dollars.

I. Mission Supporting Goals and Objectives:

The competitive market situation is driving the need for alternatives to the traditional approaches to developing conservation resources. BPA is transitioning from centralized, BPA funded programs to new customer driven approaches. BPA is participating with other regional entities to support market transformation activities and development of energy services business systems and products.

II. Funding Schedule of Accrued Expenditures:

(Dollars in thousands)

Program Activity	FY 1995	FY 1996	FY 1997 1/	$ Change	% Change
Existing Activities	$ 59,000	$ 55,000	$ 25,000	$ -30,000	-55%
Marketing Transformation	--	10,000	10,000	--	--
Energy Service Charge	--	40,000	40,000	--	--
Total, Marketing, Conservation & Production - Capital Expenditures	$ 59,000	$ 105,000	$ 75,000	$ -30,000	-29%
Total Capital Obligations	$ 59,000	$105,000	$ 54,000	$ -51,000	-49%

1/ The FY 1997 accrual amount of $75 million consists of $54 million in new obligations and $21 million for projected expenditures in FY 1997 for multi-year conservation contract commitments made in prior years. The obligation amounts for FY 1997 are $4 million for Existing Activities, $10 million for Market Transformation, and $40 million for conservation and energy efficiency activity. The contract commitments were made as part of BPA's rate-based conservation programs run in partnership with utilities. These programs ended in FY 1995 and were replaced with new conservation reinvention approaches, including the new Market Transformation program.

1525

III. Performance Summary:

FY 1995 Accomplishments:

- **Existing Activities:** Acquired an estimated 49 average megawatts. Supported utilities in transition to locally funded conservation programs, and development of local conservation plans to meet specific customer needs. Ongoing program areas include residential, commercial, industrial, agricultural conservation acquisitions. Began developing products and researching markets for marketing energy services. Collaboratively developed future directions for implementation of Bonneville's conservation responsibilities with customers, interest groups, local, state and federal agencies, and other external entities.

- **Market Transformation:** Discussed proposed ventures in regional forums collaboratively shape and define this activity. Conducted educational briefings for local, state and federal entities in addition to other interested parties, to share information on how this activity fits in Bonneville's new approach to meeting its conservation responsibilities. Established regional infrastructure, and entered into collaborative partnerships with utilities and other sponsors of national ventures.

FY 1996 Planned Accomplishments:

- **Existing activities:** Support utilities in transition to locally funded conservation programs, and development of local conservation plans to meet specific customer needs. Complete local conservation plans for 50 percent of the utilities in Bonneville's service territory. Oversee and monitor program close-out for residential, commercial, industrial, agricultural conservation acquisitions. Collaboratively develop future directions for implementation of Bonneville's conservation responsibilities with customers, interest groups, local, state and federal agencies, and other external entities.

- **Market Transformation:** Continue regional infrastructure activities. Begin research and development projects identified in collaborative forums. In partnership with other entities, provide funding for regional projects that support market transformation for manufactured housing, electric lighting and washing machines. Define and begin additional ventures related to motors, irrigated agricultural pumping schedules, and geothermal heat pumps. Continue developing new regional partnerships to explore potential market transformation opportunities. Continue forums to share information with customers and other external entities.

- **Energy Service Charge/Conservation and Energy Efficiency Services:** This funding will be used for two related but different activities. First, Bonneville will support utility transition to locally funded programs through offering alternative financing mechanisms, local planning and collaborative policy development. The alternative financing mechanism (Energy Service Charge) allows Bonneville to recover these funds through a recovery of the value of the energy savings associated with the projects for which funds are used. Bonneville is also collaboratively working with customers to locate non-governmental sources of funds for running customer-specific conservation and energy efficiency programs. It is intended that the alternative funding mechanism is a short-term transition option to support customers. The BPA Marketing Plan stresses that reliance on incentives to encourage consumer participation in Bonneville conservation and energy efficiency programs should be replaced with other approaches that are more market-driven and results oriented.

Second, this funding provides support to conservation and energy efficiency services, which include energy audits and other conservation and energy efficiency related activities. This overall activity may be subject to substantial further reductions as Bonneville considers new ways to carry out its conservation and energy efficiency responsibilities. All funds in this activity will be reimbursed to Bonneville through revenues received from conservation and energy eficiency services sales, and energy received from customers in Shared Savings agreements.

FY 1997 Planned Accomplishments:

- **Existing activities:** Support utilities in transition to locally funded conservation programs, and development of local conservation plans to meet specific customer needs. Complete local conservation plans for the second 50 percent of the utilities in Bonneville's service territory. Oversee and monitor program close-out for residential, commercial, industrial, agricultural conservation acquisitions. Collaboratively develop future directions for implementation of Bonneville's conservation responsibilities with customers, interest groups, local, state and federal agencies, and other external entities.

- **Market Transformation:** Continue regional infrastructure activities. Continue research and development projects identified in collaborative forums. In partnership with other entities, provide funding for regional projects that support market transformation for manufactured housing, electric lighting, washing machines, motors, irrigated agricultural pumping schedules, and geothermal heat pumps. Begin development of additional ventures that have been identified in regional forums. Continue developing new regional partnerships to explore potential market transformation opportunities. Continue forums to share information with customers and other external entities.

- **Energy Service Charge/Conservation and Energy Efficiency Services:** This funding will be used for two related but different activities. First, Bonneville will support utility transition to locally funded programs through offering alternative financing mechanisms, local planning and collaborative policy development. The alternative financing mechanism (Energy Service Charge) allows Bonneville to recover these funds through a recovery of the value of the energy savings associated with the projects for which funds are used. Bonneville is also collaboratively working with customers to locate non-governmental sources of funds for running customer-specific conservation and energy efficiency programs. It is intended that the alternative funding mechanism is a short-term transition option to support customers. The BPA Marketing Plan stresses that reliance on incentives to encourage consumer participation in Bonneville conservation and energy efficiency programs should be replaced with other approaches that are more market-driven and results oriented.

  Second, this funding provides support to conservation and energy efficiency services, which include energy audits and other conservation and energy efficiency related activities. This overall activity may be subject to substantial further reductions as Bonneville considers new ways to carry out its conservation and energy efficiency responsibilities. All funds in this activity will be reimbursed to Bonneville through revenues received from conservation and energy eficiency services sales, and energy received from customers in Shared Savings agreements.

Explanation of Accrued Expenditures Funding Changes FY 1996 to FY 1997

The decrease of $ 30,000,000 results from rampdown and completion of rate-based incentivized resource acquisitions through conservation programs which were replaced with new conservation reinvention approaches that support utilities in setting up their own conservation programs.

TRANSMISSION SERVICES - CAPITAL

I. Mission Supporting Goals and Objectives:

Transmission Services provides for all additions, upgrades, and replacements to the Federal transmission system in the Pacific Northwest, allowing reliable service to be provided to Northwest industrial users and utility customers. The transmission system also provides for the sale and exchange of power to and from the region. The system replacement plan is to replace high risk, obsolete, and maintenance intensive facilities and equipment, and reduce catastrophic equipment failure by 1) replacement of high voltage transformers and power circuit breakers which are at or near the end of their useful life, 2) replacement of risky outdated and obsolete control and communications equipment, and 3) replacement of all other existing high risk equipment and facilities affecting the safety and reliability of the transmission system.

BPA's operational telecommunications system is being upgraded to include fiber optics for several reasons. Current microwave radios are becoming technologically obsolete and nearing the end of their useful life. Radio frequencies are difficult to obtain in some areas due to frequency congestion. Government radio frequencies have been reallocated and legislation is being proposed to reallocate and auction additional Government frequencies, including those used by BPA. Also, fiber optics will help BPA stay competitive in the new utility environment which will require increased use of real time information for scheduling and operating the transmission system.

II. Funding Schedule of Accrued Expenditures: **(Dollars in thousands)**

Program Activity	FY 1995	FY 1996	FY 1997 2/	$ Change	% Change
Allowance for Funds Used During Construction (AFUDC) 1/	$ --	$ 7,000	$ 10,000	$ +3,000	+43%
Main Grid	$ 14,000	$ 39,000	$ 44,000	$ +5,000	+13%
Area and Customer Services	$ 22,000	$ 15,000	$ 25,000	$ +10,000	+67%
Upgrades and Additions	$ 69,000	$ 56,000	$ 37,000	$ -19,000	-34%
System Replacements	$ 52,000	$ 57,000	$ 53,000	$ -4,000	-7%
Total, Transmission Services - Capital Expenditures	$ 157,000	$ 174,000	$ 169,000	$ -5,000	-3%
Total, Transmission Services - Capital Obligations	$ 150,000	$ 131,000	$ 163,000	$ +32,000	+24%

1/ In FY 1995, AFUDC is incorporated in the individual facilities' costs of the other budget line items.

2/ The difference between accruals and obligations is the amount of prior year obligations not accrued in the year of obligation. FY 1997 obligations are $43 million for Main Grid, $24 million for Area and Customer Services, $43 million for Upgrades and Additions, and $53 million for System Relacements.

1529

III. Performance Summary:

FY 1995 Accomplishments:

- **Main Grid:** (1) Completed the design for the Bellingham Area Reinforcement facility. This facility will improve the transfer capability between British Columbia and the Northwest by 850 MW and optimize the use of regional resources. (2) Completed the design and material acquisition for the Northwest Montana/North Idaho Support facility. This facility maintains reliable service in the Northwest Montana/North Idaho area. (3) Completed the design for the South Seattle-Olympia Reinforcement facility. This facility provides adequate transmission capacity to accommodate summertime generation patterns during heavy imports from Canada and maintains reliability to local loads. (4) Continued preliminary engineering and design for various transmission system, system reactive and system efficiency improvements. These facilities are required to maintain reliable service for the BPA service area.

- **Area and Customer Service:** (1) Completed the Hungry Horse-Columbia Falls line rebuild. This facility integrates the full capacity of the upgraded generation at Hungry Horse Dam. (2) Completed the Minidoka Area Service facility. This facility upgrades the 34.5-kV transmission system in the Minidoka area to 138 kV. The 34.5-kV source is from Minidoka Dam and was eliminated when the Bureau of Reclamation upgraded the powerhouse and switchyard to 138 kV. This facility reduces extensive rebuilding costs and O&M costs associated with the 34.5-kV system and eliminates many safety hazards. (3) Completed the design and acquired materials for the La Grande Transformer Support facility. This facility maintains reliable service in the Northeast Oregon area. (4) Completed the design and acquired materials for the Klickitat/Skamania Southern County Support facility. This facility will maintain reliable service in Southern Klickitat and Skamania counties. (5) Continued design on the Tri-Cities Area Reinforcement facility. This facility will maintain reliable service in the Tri-Cities, Washington, area. (6) Continued preliminary engineering and design for miscellaneous facilities which are required to maintain reliable service for the BPA service area.

- **Upgrades and Additions:** (1) Completed the design and construction of the new Munro Control Center in Spokane, Washington. Acquired major materials for the new digital microwave system. The control center replaces the Eastern Control Center in Moses Lake, Washington. (2) Completed the design and material acquisition and began construction of the Hot Springs-Garrison fiber optic communication facility, which provides alternate route communications required to meet both BPA and Western Systems Coordinating Council (WSCC) reliability requirements. (3) Also began construction of the Ross-Franklin fiber optic facility required to provide future bandwidth capacity that will allow high-speed data transfers between Dittmer and Munro Control Centers. (4) Began design of the Supervisory Control And Data Acquisition (SCADA) Backup for Emergencies (phase 2). The backup will provide supervisory control and monitoring of all substations at Dittmer and Munro control centers. (5) Completed and continued preliminary engineering, design, material acquisition, and construction for various system additions required to maintain reliable service for the BPA service area.

III. Performance Summary (Cont'd)

- **System Replacements:** (1) Acquired additional land for the Covington Maintenance Headquarters facility to enable future expansion in an area increasing in population density. (2) Replaced the major refueling station at Ross, which eliminates an environmental hazard. (3) Increased fire protection at the Celilo DC Converter Station to minimize risk of a major outage. (4) Resurfaced 12 deteriorating switchyards. (5) Rebuilt 2 Celilo converter transformers in lieu of replacement, saving about $4 million. (6) Replaced old and maintenance-intensive 500-kV breakers at John Day and Ostrander Substations to reduce risk of catastrophic failures and system outages and to maintain system reliability. (7) Replaced numerous lower voltage breakers at 21 substations to reduce risk of catastrophic failures and system and customer outages and to maintain system reliability. (8) Replaced the following system protection devices for system reliability: annunciators at 6 stations, relays at 23 stations, substation integrated control systems (SICS) at 2 stations, and oscillographs at 4 stations. (9) Replaced the following system control devices for system reliability: microwave transfer trip (MWTT) devices at 16 stations, SCADA devices at 10 stations, UHF radios at 16 stations, and communication batteries and chargers at 30 stations.

FY 1996 Accomplishments (to date and planned):

- **Main Grid:** (1) Complete material acquisition and begin construction of the Bellingham Area Reinforcement facility. (2) Complete material acquisition and begin construction of the South Seattle-Olympia Reinforcement facility. (3) Complete construction of the Northwest Montana/North Idaho Support facility. (4) Begin preliminary engineering on the Eastern Canadian Intertie (Grand Coulee Dam to the Canadian Border 'Oliver') facility. This facility, which is approved in accompanying Appropriations language authority, provides transmission facilities that are required for returning the Canadian Entitlement power to Canada and to increase power transfer capability between the U.S. and Canada. (5) Begin preliminary engineering on the Southwest Portland Area Support facility. This facility will prevent overloads of the BPA and PGE facilities which would otherwise result in violation of the National Electric Safety Code, and will eliminate equipment damage. (6) Begin preliminary engineering for the King County System Reinforcement facility. This facility is required to provide adequate transmission capacity to accommodate spring and summer generation patterns during heavy imports from Canada and to maintain reliability to local loads. (7) Continue preliminary engineering and design for various transmission system, system reactive, and system efficiency improvements. These facilities will be required to maintain reliable service for the BPA service area.

- **Area and Customer Service:** (1) Complete construction for the La Grande Transformer Support facility. (2) Complete construction for the Klickitat/Skamania Southern County Support facility. (3) Complete design, material acquisition, and construction for the Tri-Cities Area Reinforcement facility. (4) Complete design and material acquisition for The Dalles Area Reinforcement facility. This facility is required to maintain system stability and to dispatch generation from The Dalles Powerhouse without transmission restrictions, and to provide reliable service to the 115-kV load in the area. (5) Begin preliminary engineering for the Teton Area Reinforcement facility. This facility is needed to prevent low voltages in the Teton, Idaho, and Jackson, Wyoming, area. (6) Begin preliminary engineering for the Franklin Area Reinforcement facility. This facility will maintain reliable service in the Franklin County, Washington area. (7) Complete design and material acquisition for the Chehalis Transformer Support facility. This facility will maintain reliable service in the Chehalis, Washington, area. (8) Continue preliminary engineering and design for miscellaneous facilities are required to maintain reliable service for the BPA service area.

III. Performance Summary (Cont'd)

- **Upgrades and Additions:** (1) Energize and commence testing of the new Munro Control Center and associated microwave radio communications. (2) Energize the Hot Springs-Garrison and Ross-Franklin fiber optic communications facilities. (3) Begin design of the Operational Data Network facility, which will simplify the interconnection of control center data systems. (4) Begin the "B" system replacement, which will enhance the reliability of remedial action schemes. (5) Begin construction of the SCADA Master replacement. (6) Begin design and material acquisition for the HVDC Master Controller at Celilo. This facility will provide a simplified scheduling interface that will allow scheduling of the DC Intertie based on required power transfer from the dispatchers. (7) Complete and continue preliminary engineering, design, material acquisition, and construction for various system additions that are required to maintain reliable service for the BPA service area.

- **System Replacements:** (1) Perform major resurfacing at Redmond Substation to maintain usability of the facility. (2) Remodel regional office at Alvey. (3) Resurface 13 deteriorating switchyards. (4) Replace 500-kV transformers at Troutdale as result of explosion and fire, in order to maintain system reliability. (5) Rebuild 2 Celilo converter transformers in lieu of replacement, saving about $4 million. (6) Replace high-risk 500-kV breakers at Vantage, Marion, Little Goose, Monroe and Keeler to reduce risk of catastrophic failures and system outages and to maintain system reliability. (7) Replace numerous lower voltage breakers at 21 substations to reduce risk of catastrophic failures, system and customer outages, and to maintain system reliability. (8) Replace the following system protection devices for system reliability: annunciators at 10 stations, relays at 19 stations, and SICS at 2 stations, and oscillographs at 5 stations. (9) Replace the following system control devices for system reliability: MWTT devices at 28 stations, SCADA devices at 11 stations, UHF radios at 20 stations, telemetering devices at 18 stations, and communications batteries and chargers at 18 stations.

FY 1997 Accomplishments (Planned):

- **Main Grid:** (1) Complete construction of the Bellingham Area Reinforcement facility. (2) Complete construction of the South Seattle-Olympia Reinforcement facility. (3) Continue preliminary engineering on the Eastern Canadian Intertie (Grand Coulee Dam to the Canadian Border 'Oliver') facility. (4) Continue preliminary engineering on the King County System Reinforcement facility. (5) Continue preliminary engineering and design for various transmission system, system reactive, and system efficiency improvements. These facilities will be required to maintain reliable service for the BPA service area.

- **Area and Customer Service:** (1) Complete construction for The Dalles Area Reinforcement facility. (2) Complete construction for the Chehalis Transformer Support facility. (3) Continue preliminary engineering on the Teton Area Reinforcement facility. (4) Continue preliminary engineering on the Franklin Area Support facility. (5) Continue preliminary engineering and design for miscellaneous facilities which are required to maintain reliable service for the BPA service area.

1532

III. Performance Summary (Cont'd)

- **Upgrades and Additions:** (1) Complete testing and commence commercial operation of the Munro Control Center. (2) Energize SCADA backup, SCADA Master replacement at Dittmer, Operational Data Network, HVDC Master Controller. (3) Continue design and acquisition of materials for the B system replacement. (4) Begin design of the Breaker Failure Protection Retrofit (Phase 8) facility, which will detect breaker failures at seven 500 kV substations. (5) Begin the design of the Backup AGC system and Scheduling Function for the Munro Control Center. These facilities are critical to efficient interconnected operation of the power system and its regional ties. This is also a key element in complying with DOE order 1360.2. (6) Begin the design for an alternate control center capability (phase 2) at Munro Control Center in the event of catastrophic equipment failure at Dittmer. (7) Complete and continue preliminary engineering, design, material acquisition, and construction for various system additions that are required to maintain reliable service for the BPA service area.

- **System Replacements:** (1) Resurface 4 deteriorating switchyards. (2) Repair or replace 7 radio station buildings to adequately protect communications equipment. (3) Perform major HVAC (heating, ventilation and air conditioning) replacements at Celilo and Ross facilities to protect expensive equipment and prevent outages. (4) Replace old water and sewer systems at Troutdale and Covington to meet current standards. (5) Rebuild 2 Celilo converter transformers in lieu of replacement, saving about $4 million. (6) Replace old and maintenance-intensive 500-kV transformers at Lower Monumental to reduce risk of catastrophic failures and system outages, and to maintain system reliability. (7) Replace numerous lower voltage breakers at 13 substations to reduce risk of catastrophic failures and system and customer outages, and to maintain system reliability. (8) Replace old and worn out disconnect switches at 7 substations to protect other expensive equipment. (9) Replace the following system protection devices for system reliability: annunciators at 10 stations, relays at 14 stations, and oscillographs at 9 stations. (10) Replace the following system control devices for system reliability: MWTT at 17 stations, SCADA devices at 11 stations, and UHF radios at 18 stations, telemetering devices at 18 stations, and communications batteries and chargers at 20 stations.

Explanation of Accrued Expenditure Funding Changes FY 1996 to FY 1997:

The system replacements component of the program decreased $4,000,000. The other budget line items of the program, main grid, area and customer service, and upgrades and additions combined, decreased by $1,000,000. All categories of capital investments in BPA's Transmission Services Program reflect funding adjustments necessary to make strategic investments for reliable and economic energy transmission while attempting to reduce investment requirements and reschedule energizations to support BPA's necessity to remain competitive in the region and fulfill its regional transmission service role.

1593

ASSOCIATED PROJECT COSTS - CAPITAL

I. **Mission Supporting Goals and Objectives:**

This program provides direct funding for additions, improvements and replacements of existing U.S. Bureau of Reclamation and Corps of Engineers hydroelectric projects in the Pacific Northwest. In addition to generating electricity, these projects serve many purposes including flood control, navigation, irrigation, recreation and water supply. The Bureau and Corps emphasize efficient power production from existing facilities and improvement of the performance and availability of power units. BPA is currently working with the Bureau and Corps to identify opportunities which increase system reliability and output.

II. **Funding Schedule of Accrued Expenditures:** (Dollars in thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Corps of Engineers Capital	$ --	$ 2,000	$ 5,000	$ +3,000	150%
Bureau of Reclamation Capital	18,000	25,000	10,000	-15,000	-60%
Allowance for Funds Used During Construction (AFUDC)	--\1	4,000	3,000	-1,000	-25%
Total, Associated Project Costs - Capital Expenditures	$ 18,000	$ 31,000	$ 18,000	$ -13,000	-42%
Total - Capital Obligations	$ 18,000	$ 31,000	$ 18,000	$ -13,000	-42%

\1 AFUDC is incorporated in projects' costs of the budget line items when they are actually incurred. In other years, they are programmatic estimates.

1534

III. Performance Summary:

FY 1995 Accomplishments:

- Worked with both the Corps and the Bureau to better understand and agree on which capital improvement projects need to be budgeted and scheduled, are cost effective and are of mutual benefit to provide system or site specific enhancements and efficiencies. These types of projects are in line with BPA's strategic business objectives (SBO) to keep the power system reliable, be the low cost provider and operate in a more business-like manner.

- **Corps of Engineers:** Implemented direct funding of Corps capital investments in FCRPS. Continued direct funding of work for Unit No 9 Rewind at The Dalles and the 3-D Cam Update project

- **Bureau of Reclamation:** Continued direct funding of work for Rewinds and Stator Core Replacements G-22, G23 and G24 at Grand Coulee, the Powerhouse Replacement at Minidoka, and the Powerhouse Transformer Replacement and Switchyard Upgrade at Hungry Horse.

FY 1996 Accomplishments:

- Continue work with both the Corps and the Bureau to reach mutual agreement on which capital improvement projects need to be budgeted and scheduled, are cost effective and are of mutual benefit to provide system or site specific enhancements and efficiencies. These types of projects are in line with BPA's SBOs to keep the power system reliable, be the low cost provider and operate in a more business-like manner.

- **Corps of Engineers:** Complete work on Unit No. 9 Rewind at the Dalles and the 3-D Cam Update project, continue working on the 3-D Cam Update project. Begin work on Unit No.7 Rewind at The Dalles

- **Bureau of Reclamation:** Continue direct funding of work for Rewinds and Stator Core Replacements G22, G23 and G24 at Grand Coulee, the Powerhouse Replacement at Minidoka, and the Powerhouse Transformer Replacement and Switchyard Upgrade at Hungry Horse. Begin direct funding for Turbine Runner Replacements G1-G18 at Grand Coulee and the Boise River Diversion Powerplant Rebuild.

- Allowance for Funds Used During Construction (AFUDC) represents BPA's estimated capitalized interest cost on borrowings for construction work-in-progress.

III. Performance Summary (Cont'd)

FY 1997 Planned Accomplishments:

- Continue work with both the Corps and the Bureau to reach mutual agreement on which capital improvement projects need to be budgeted and scheduled, are cost effective and are of mutual benefit to provide system or site specific enhancements and efficiencies. These types of projects are in line with BPA's SBOs to keep the power system reliable, be the low cost provider and operate in a more business-like manner.

- **Corps of Engineers:** Complete work on Unit No.9 Rewind, Unit No.7 Rewind at The Dalles.

- **Bureau of Reclamation:** Complete work on the Rewinds and Stator Core Replacements G22, G23 and G24, at Grand Coulee, the Powerhouse Replacement at Minidoka, and the Powerhouse Transformer Replacement and Switchyard Upgrade at Hungry Horse. Continue direct funding for the Turbine Runner Replacements G1-G18 at Grand Coulee and the Boise River Diversion Powerplant Rebuild.

- **Allowance for Funds Used During Construction :** (AFUDC) represents BPA's estimated capitalized interest cost on borrowings for construction work-in-progress.

Explanation of Accrued Expenditure Funding Changes FY 1996 to FY 1997:

The decrease of $13,000,000 reflects a reduced fiscal level and/or rate of BPA direct-funded capital investment in Corps and Bureau FCRPS hydro projects. These reduced levels of BPA's funding of cost-effective hydro-project generating equipment improvements and efficiency projects are made in response to BPA's cost reductions to improve its competitive position and to help ensure BPA's fiscal capability to make its annual repayment of FCRPS cost to the Treasury

1596

I. **Mission Supporting Goals and Objectives:**

This activity provides for the protection, enhancement and mitigation of Columbia River Basin fish and wildlife losses attributed to the development and operation of hydroelectric projects on the Columbia River and its tributaries pursuant to Section 4(h) of the Pacific Northwest Power Act. BPA discharges a major portion of its fish and wildlife responsibilities and reduces the Administrator's obligation, by funding projects and activities designed to be consistent with the Northwest Power Planning Council's Fish and Wildlife Program. BPA is also mandated to implement measures called for under the Endangered Species Act. These measures are part of the Biological Opinions (BO) issued by the National Marine Fisheries Service (NMFS) and the U.S. Fish and Wildlife Service (USFWS) regarding the operations of the Federal Columbia River hydro system. The capital associated with implementing the reasonable and prudent alternatives of the BOs that relate to BPA's direct fish and wildlife program are included in this budget projection. Additionally, this capital budget reflects, and is consistent with, the fish and wildlife budget agreement announced by the Administration in October 1995 that calls for BPA fish and wildlife expenses of $435 million per year on average for the period FY 1996 through FY 2001.

BPA's fish and wildlife capital program is directed at activities that increase numbers of Columbia River Basin fish and wildlife resources including projects designed to increase juvenile fish passage at mainstream dams, increase fish production and survival through construction of hatchery and acclimation facilities, fish monitoring facilities and fish habituate enhancement. Funding is also included for pre-engineering design and studies for new and developing projects. The priority for capital project funding will focus first on implementing the reasonable and prudent alternatives contained in the NMFS and USFWS Biological Opinions and second, on implementing the Council's Fish and Wildlife Program. A current goal of the Power Planning Council, and one supported by BPA, is that all projects funded under both Bonneville's direct program as well as the reimbursable and capital investment components of the other Federal agencies (see Fish and Wildlife Investments Crosscut Tables at front of budget document) will be reviewed and prioritized as part of a Power Planning Council initiative process. It is anticipated that such a process will be examined and considered as part of the Power Planning Council's 180-day review of governance for fish and wildlife within the Federal Columbia River Power System as called for in the FY 1996 Energy and Water Appropriations Act.

Pollution Prevention and Abatement resources support compliance with environmental laws and regulations and mitigate environmental risks associated with operation of the power system. This program assures compliance with the law, and targets pollution prevention and waste minimization. Environmental restoration of the Bonneville power system and capital improvements to mitigate and prevent future contamination are undertaken. The principal components are replacement of polychlorinated biphenyl (PCB) capacitors, installation of secondary oil containment and fire prevention equipment, and investigation and cleanup under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA).

II. Funding Schedule of Accrued Expenditures: **(Dollars in thousands)**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Anadromous Fish	$ 18,000	$ 25,000	$ 25,000	$ --	--%
Wildlife Program	13,000	--	--	--	--%
Pre-engineering Design	1,000	2,000	2,000	--	--%
Subtotal Fish & Wildlife	32,000	27,000	27,000	--	
Pollution Control & Abatement	16,000	15,000	13,000	-2,000	-13%
Total, Environment/Fish & Wildlife - Capital Expenditures	$ 48,000	$ 42,000	$ 40,000	$ -2,000	-5%
Total Capital Obligations	$ 43,000	$ 42,000	$ 40,000	$ -2,000	-5%

III. Performance Summary:

FY 1995 Accomplishments:

- **Anadromous Fish:** Bonneville continued construction on Yakima and Umatilla River hatcheries, the Yakima Screens Facilities Phase II, began final design work on the Nez Perce Hatchery and continued pre-design on the on Bonneville Dam Fish Sampling Facility. Construction continued on habitat improvement and passage projects, and small irrigation screening projects. Implementation continued for high priority Endangered Species Act related projects that include development and enhancement of model watersheds and activities associated with the National Marine Fisheries Service Biological Opinion.

- **Wildlife Program:** The wildlife program trust activity includes trust agreements established with the states in the Columbia Basin region. The trusts are designed to remedy the hydropower portion of the damage to river areas adjacent to the dams constructed. These trust arrangements should indemnify BPA from further fiscal exposure from this damage. Funding of approved trusts was completed.

- **Pre-engineering Design for Fish and Wildlife:** Funded pre-design work on future projects and fund ongoing engineering analysis as required.

- **Pollution Control & Abatement:** Several 500 megavolt-ampere reactive (MVAR) polychlorinated biphenyl (PCB) capacitors have been retired or replaced with non-PCB capacitors. Replacement of 300 MVAR PCB capacitors is in progress. Secondary oil containment and fire prevention equipment was installed at three substations and is in progress at seven additional substations. Ross Complex Superfund tasks: Fog chamber contamination has been capped; PCB capacitor yards have been cleaned up and replaced with non-PCB capacitors; cleanup of the capacitor test site

and wood pole yard are in progress. The Preliminary Assessment of the Starr Complex and Port Angeles Substation have been completed. Several hydrocarbon and PCB cleanups on the Bonneville power system have been completed.

FY 1996 Accomplishments (to date and planned):

- **Anadromous Fish:** Continue construction on the Yakima and Umatilla River hatcheries, the Yakima Screens Facilities Phase II; complete final design and initiate construction of the Nez Perce Hatchery, initiate final design of the Bonneville Dam Fish Sampling Facility. Continue pre-design work on Northeast Oregon hatchery. Construct habitat improvement passage projects and small irrigation screening projects. Continue implementation for high priority Endangered Species Act related projects that include development and enhancement of model watersheds and activities associated with the National Marine Fisheries Service Biological Opinion.

- **Wildlife Program:** No farther activities are anticipated for funding under this budget item now that approved wildlife trusts have been fully funded.

- **Pre-engineering Design for Fish & Wildlife:** Fund early pre-design work on future projects and fund ongoing engineering analysis as required.

- **Pollution Control & Abatement:** Continue replacement of 700 MVAR PCB capacitors as well as the installation of secondary oil containment and fire prevention equipment. Continue the cleanup of the capacitor test site and wood pole yard at Ross continue.

FY 1997 Planned Accomplishments:

- **Anadromous Fish:** Continue construction on the Yakima and Umatilla River hatcheries, the Yakima Screens Facilities Phase II; continue construction of the Nez Perce Hatchery, complete final design on the Bonneville Dam Fish Sampling Facility. Continue pre-design work on Northeast Oregon hatchery. Construct habitat improvement passage projects and small irrigation screening projects. Continue implementation for high priority Endangered Species Act related projects that include development and enhancement of model watersheds and activities associated with the National Marine Fisheries Service Biological Opinion.

- **Wildlife Program**: No activities are anticipated for funding under this budget item now that approved wildlife trusts have been fully funded.

- **Pre-engineering Design for Fish & Wildlife:** Fund early pre-design work on future projects and fund ongoing engineering analysis as required/necessary.

- **Pollution Control & Abatement:** Continue the replacement of PCB capacitors with non-PCB capacitors. Continue the installation of oil spill containment and fire prevention equipment.

Explanation of Accrued Expenditures Funding Changes FY 1996 to FY 1997:

The fish and wildlife components of the program reflect a level program consistent with the fish and wildlife budget agreement announced by the Administration in October 1995, and the pollution control and abatement activity funding decreases $2,000,000 due to a priority change that emphasizes fire protection.

BONNEVILLE POWER ADMINISTRATION

CAPITAL EQUIPMENT

I. Mission Supporting Goals and Objectives:

This activity provides for the acquisition of general and dedicated special purpose capital automatic data processing (ADP) equipment, development of capitalized ADP software, and acquisition of special-use capital furniture and equipment in support of all BPA programs.

II. Funding Schedule of Accrued Expenditures:

(Dollars in thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capital Equipment Accrued Expenditures	$ 17,000	$ 13,000	$ 12,000	$ -1,000	-8%
Capital Equipment, Obligations	$ 17,000	$ 13,000	$ 12,000	$ -1,000	-8%

III. Performance Summary:

FY 1995 Accomplishments:

- Acquired capital office furniture and equipment, capital ADP-based administrative telecommunications equipment, ADP equipment (hardware), and support capital software development for all BPA programs.

FY 1996 Accomplishments:

- Acquire capital office furniture and equipment, capital ADP-based administrative telecommunications equipment, ADP equipment (hardware), and support capital software development for all BPA programs. FY 1995 was a major acquisition period for BPA's local area network-wide area network (LAN/WAN) conversions.

III. Performance Summary (Cont'd)

FY 1997 Planned Accomplishments:

- Acquire capital office furniture and equipment, capital ADP-based administrative telecommunications equipment, ADP equipment (hardware), and support capital software development for all BPA programs.

Explanation of Accrued Expenditures Funding Changes FY 1996 to FY 1997

The decrease of $1,000,000 reflects the program's contributions, through reduced ADP hardware acquisitions (e.g., PC's, printers, monitors, etc.), to BPA's recent cost-reductions made to enhance the agency's fiscal integrity and improve service delivery and customer satisfaction.

1542

BONNEVILLE POWER ADMINISTRATION

CAPITALIZED BOND PREMIUM

I. Mission Supporting Goals and Objectives:

Bonneville Power Administration incurs a bond premium whenever it repays or refinances a bond before the due date. When bonds are refinanced, the bond premiums incurred are capitalized. Historically, BPA generally has chosen to finance capitalized bond premiums with bonds issued to the U.S. Treasury, as was envisioned in the Federal Columbia River Transmission System Act of 1974.

II. Funding Schedule:

(Dollars in thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Capitalized Bond Premium, Accrued Expenditures	$ 0	$ 0	$ 0	$ 0	0
Capitalized Bond Premium, Obligations	$ 0	$ 0	$ 0	$ 0	0

III. Performance Summary:

FY 1995 Accomplishments:

- BPA made no refinancings requiring capital bond premium funding.

FY 1996 Accomplishments (to date and planned):

- BPA plans no refinancing requiring capital bond premium financing. Financial market conditions could change, however, and present business opportunities which would reduce ratepayer costs and increase the obligation and use of borrowing authority to finance the capitalized bond premium.

FY 1997 Planned Accomplishments:

- BPA plans no refinancing requiring capital bond premium financing. Financial market conditions could change, however, and present business opportunities which would reduce ratepayer costs and increase the obligation and use of borrowing authority to finance the capitalized bond premium.

BONNEVILLE POWER ADMINISTRATION

RESIDENTIAL EXCHANGE - OPERATING EXPENSE

I. **Mission Supporting Goals and Objectives:**

The Pacific Northwest Power Act created the residential exchange program to extend the benefits of low-cost Federal Power to the residential and small farm customers of investor-owned and publicly-owned utilities. Although it appears to be primarily a power transaction and is so treated in BPA's rate proceedings, the residential exchange is not a power transaction in the conventional sense. In effect, the program acts to lower the rates paid by the residential and small farm customers of exchanging utilities. No power is transferred to or from BPA. The gross cost of the exchange is partially offset by exchange revenues from participating utilities. The following estimates are updated for the 1996 Supplemental Rate Proposal

II. **Funding Schedule of Accrued Expenditures:**

(Dollars in Thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Residential Exchange - Gross Cost	$ 1,007,000	$ 976,000	$ 1,140,000	$ 164,000	+17%
Revenue from Residential Exchange	809,000	828,000	993,000	165,000	+20%
Residential Exchange - Accrued Expenditures	$ 198,000	$ 148,000	$ 147,000	$ -1,000	-1%
Expense Obligations	1,007,000	976,000	1,140,000	164,000	+17%

III. **Performance Summary:**

FY 1995 Accomplishments:

- Exchanged 3,369 average megawatts of energy with 20 utilities in the region as mandated by the Pacific Northwest Power Act in order to extend the benefits of low-cost Federal power to regional residential and small farm customers.

1544

III. Performance Summary (Cont'd)

FY 1996 Accomplishments (to date and planned):

- Exchange 3,410 average megawatts of energy with 20 utilities in the region as mandated by the Pacific Northwest Power Act in order to extend the benefits of low-cost Federal power to regional residential and small farm customers

FY 1997 Planned Accomplishments:

- Comply with Energy and Water Development Appropriations Act, Public Law 104-46, by distributing $145 million in residential exchange cost benefits to utilities in the Residential Exchange Program based on such utilities' share of total FY 1995 residential exchange cost benefits.

Explanation of Funding Changes FY 1996 to FY 1997:

In accordance with the provisions of the Energy and Water Development Appropriations legislation for FY 1996, the cost of the program for 1997 is $145,000,000 in exchange cost benefits plus program implementation costs, essentially the same as the costs for FY 1996.

MARKETING, CONSERVATION & PRODUCTION - OPERATING EXPENSE

I. Mission Supporting Goals and Objectives:

This activity includes all BPA strategic resource planning and business development, short and long-term power purchases/wheeling, electric utility marketing of resources, conservation and energy services, generation and oversight costs, including the large thermal nuclear projects. This program identifies the Administrator's load obligations, plans and develops products and services to meet the needs of BPA customers, and acquires resources as needed. BPA is committed to meeting its share of the regional conservation targets set by the Northwest Power Planning Council in its regional power plan through demand-side management products and energy services; and investment in market transformation activities.

II. Funding Schedule of Accrued Expenditures: **(Dollars in Thousands)**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Short -Term Power Purchases/PNCA Interchange	$ 164,000	$ 188,000	$ 93,000	$ -95,000	-51%
Long -Term Power Purchase/Wheeling	25,000	66,000	85,000	+19,000	+29%
Power Scheduling/Marketing	87,000	99,000	98,000	-1,000	-1%
Conservation	17,000	63,000	50,000	-13,000	-21%
Generation & Oversight	20,000	24,000	22,000	-2,000	-8%
Trojan	10,000	22,000	27,000	+5,000	+23%
WNP-2	409,000	413,000	418,000	+5,000	+1%
WNP-1/Hanford and WNP-3	305,000	322,000	312,000	-10,000	-3%
Total Marketing, Conservation & Production - Operating Expense	$ 1,037,000	$ 1,197,000	$ 1,105,000	$ -92,000	-8%
Total Marketing, Conservation & Production - Expense Obligations	$ 1,037,000	$ 1,197,000	$ 1,105,000	$ -92,000	-8%

1546

III. Performance Summary:

FY 1995 Accomplishments:
Conservation:

- **Existing Activities**: Acquired conservation resources through competitive acquisition, billing credits and multi-sector mechanisms. Reimbursed Eugene Water Electric Board (EWEB) for residential weatherization. Provided financial assistance to local governments, Indian Tribes, and utilities for technical assistance, utility and builder training, and enforcement of Model Conservation Standards (MCS). Continue Super Good Cents marketing program. Continued the State Technical Assistance Program on encourage efficient use of electrical energy and renewable resources. Began development of products and services for Energy Services Business.

- **Market Transformation**: Started this activity. Funds covered salaries, investments in research and development projects, and support for national collaborative and research efforts. Bonneville supported regional infrastructures, including education and information outreach, state and local governments, community colleges, and the architectural design community.

FY 1996 Planned Accomplishments (to date and planned):
Conservation:

- **Existing Activities**: Continue previously contracted conservation activities as described in FY 1995. Renegotiate conservation contracts to achieve additional cost savings while maintaining acquisition of identified energy savings. Complete approximately one-third of the rate-based conservation programs. Support utilities through providing economic analyses, load forecasts, and analytical tools to aid the transition to locally funded conservation activities.

- **Market Transformation**: Continue support of regional infrastructures, research and development projects, and national efforts to raise awareness of opportunities to conserve energy. Support was provided for regional investments in energy efficient building codes and standards. The residential laundry venture was designed and implemented, and other ventures began to develop in motors, irrigated agricultural pump scheduling, and geothermal heat pumps.

- **Energy Services Business:** Continue development of products and services that generate positive net revenues for Bonneville. Identify potential markets and negotiate sales of products and services. Prepare bids and other cost/benefit analyses to support decisions on markets to pursue and sales to conclude. Train staff to ensure professional delivery of products and services. Begin implementation of sales agreements. Design additional internal business systems as needed to track and report costs and revenues. Develop staffing strategy to support the goal of the Energy Services Business becoming self-supporting as quickly as possible.

FY 1997 Planned Accomplishments:
Conservation:

- **Existing Activities:** Continue previously contracted conservation activities as described in FY 1995. Continue renegotiations of selected conservation contracts to achieve additional cost savings while maintaining acquisition of identified energy savings. Complete approximately one-third of the rate-based conservation programs. Support utilities through providing economic analyses, load forecasts, and analytical tools to aid the transition to locally funded conservation activities.

- **Market Transformation:** Continue previous year activities in infrastructure, research and development projects, national efforts, support for energy efficient building codes, and other ventures designed to raise awareness for opportunities to conserve energy.

- **Energy Services Business:** Continue development of energy management products and services that generate positive net revenues for Bonneville. Using results from energy management sales to date and market analyses, continue identification of additional markets and negotiate sales of product and services. Prepare bids and cost/benefit analyses to support decisions on energy management markets to pursue and on sales. Continue training of staff as more staff shifts from supporting rate-based conservation programs to supporting and implementing the Energy Services Business. Continue implementation of energy management sales agreements. Continue to update internal business systems as needed to track and report costs and revenues. Update staffing strategy to support the goal of the Energy Services Business becoming self-supporting as quickly as possible. This business activity does not include providing power brokering services nor does it include power marketing services inconsistent with Bonneville's current authority.

Other Marketing, Conservation & Production

FY 1995 Accomplishments:

- **Short-Term Power Purchases/PNCA Interchange:** Purchased power for resale, fish mitigation or for the efficient operation of the power system. Under terms of the Pacific Northwest Coordination Agreement (PNCA), made payments to other generating utilities for power received as interchange energy. Interchange energy is energy transferred between utilities either to supply all or a part of any deficiency between a utility's actual energy capability and its firm energy load carrying capability or to return such energy to the supplying utility.

- **Long-Term Power Purchase/Wheeling:** Acquired 100 percent of the Idaho Falls and Cowlitz Falls hydroelectric project output. Continued contract payments to acquire the power from one demonstration geothermal site in the region. Continued acquisition of power from existing billing credit projects.

- **Power Scheduling/Marketing:** Scheduled and marketed electric energy to BPA customers and Pacific Northwest's interconnected utilities. Placed major emphasis on scheduling and supporting implementation of intertie access policy and streamflow coordination with the water budget of the Fish and Wildlife Program.

- **Generation & Oversight:** Provided oversight of all contracts signed to date in addition to the CARES and the Wyoming Wind Projects. Finished the NEPA process for the Resource Contingency Program (RCP) Projects and the Conservation and Renewable Energy System (CARES) Wind Project, and started the National Environmental Policy Act (NEPA) process for the Glass Mountain Project. Created a new 6(c) process for the RCP Projects.

- Developed coordinated operation of the Pacific Northwest and Canadian Power Systems, investigate and analyze Canadian proposals for power export, analyze intertie needs and the economics of proposed intertie expansions. Provided oversight of large thermal generating plants from which BPA purchases capability to insure that all BPA approval rights are protected; coordinated, communicated and administered agreements, issues and programs between BPA and the project owners.

- Provided litigation and legal services covering existing and prospective financing arrangements involving the nuclear generating projects; Columbia River Treaty, non-Treaty and related resources issues; conservation and other resources acquired by BPA; and research relating to bankruptcy and tax issues involving entities with whom BPA has an existing contractual relationship. Includes major contract with the Department of Justice for the WNP-1 and WNP-3 cost sharing litigation.

- **Trojan:** The Trojan Nuclear power plant was terminated in 1993. Work continues on the decommissioning of the plant under the prompt DECON method. BPA funds Eugene Water and Electric Board's Trojan related costs including Trojan debt service and 30 percent of the decommissioning costs.

- **WNP-2:** Washington Public Power Supply System's WNP-2 is a 1,150 megawatt boiling water reactor nuclear power plant. BPA's budget provides for continued contractual obligation to acquire the full generating capability of the plant and to pay its debt service.. BPA pays these costs through its budget on a net-billed basis.

- **WNP-1/Hanford/WNP-3:** BPA continued to fulfill contractual obligations for WNP-1, Hanford Generating Project, and WNP-3. WNP-1 and WNP-3 nuclear power plants being built by WPPSS were terminated in 1995 and are now transitioning into asset disposition, site demolition and site restoration.

FY 1996 Accomplishments (to date and planned):

- **Short -Term Power Purchases/PNCA Interchange:** Continue activities in FY 1996 as described for FY 1995 and as consistent with the 1995 rate proposal.

- **Long -Term Power Purchase/Wheeling:** Continue acquisition of power from billing credit projects. Make option payments on contingency resource projects.

- Complete pre-construction activities for Wyoming Wind Project and CARES Wind Project. Pay pre-construction and investigation expenses for competitive acquisitions, if required. Terminate acquisitions for projects no longer required.

1549

- **Power Scheduling/Marketing:** Schedule and market electric energy to BPA customers and Pacific Northwest's interconnected utilities. Major emphasis placed on scheduling and supporting implementation of intertie access policy and streamflow coordination with the water budget of the Fish and Wildlife Program.

- **Generation & Oversight:** Provide oversight of all contracts signed to date in addition to the CARES and the Wyoming Wind Projects. Assure that all BPA approval rights are protected, coordinate, communicate and administer agreements, issues and programs between BPA and the project owners. Finish the NEPA process and develop a new contract construct for the RCP Projects.

- Develop coordinated operation of the Pacific Northwest and Canadian Power Systems, investigate and analyze Canadian proposals for power export, analyze intertie needs and the economics of proposed intertie expansions.

- **Trojan**: Continue termination activities for Trojan Nuclear Plant.

- **WNP-2**: Continue to acquire full capability of WNP-2 and seek additional efficiencies and economies.

- **WNP-1/Hanford/WNP-3:** Continue termination activities for WNP-1, Hanford and WNP-3.

FY 1997 Planned Accomplishments:

- **Short-Term Power Purchases/PNCA Interchange**: Continue activities in FY 1997 as described in FY 1996 and as consistent with the 1996 Initial Rate Proposal.

- **Long-Term Power Purchase/Wheeling**: Continue acquisition of power from existing billing credit projects as well as Wyoming Wind Project, CARES Wind Project and Wauna. Make option payments on contingency resource projects.

- **Power Scheduling/Marketing**: Schedule and market electric energy to BPA customers and Pacific Northwest's interconnected utilities. Major emphasis placed on scheduling and supporting implementation of intertie access policy and streamflow coordination with the water budget of the Fish and Wildlife Program.

- **Generation & Oversight**: Provide oversight of all contracts signed to date. Assure that all BPA approval rights are protected, coordinate, communicate and administer agreements, issues and programs between BPA and the project owners.

- Develop coordinated operation of the Pacific Northwest and Canadian Power Systems, investigate and analyze Canadian proposals for power export, analyze intertie needs and the economics of proposed intertie expansions.

- **Trojan:** Continue termination activities for Trojan Nuclear Plant as in FY 1996.

1550

- **WNP-2**: Continue to acquire full capability of WNP-2 and seek additional efficiencies and economies. Expected generation for FY 1997 is 7,200 gigawatt-hours of electricity.

- **WNP-1/Hanford/WNP-3**: Continue termination activities for WNP-1, Hanford and WNP-3 as in FY 1996.

Explanation of Funding Changes FY 1996 to FY 1997:

The net decrease of $92,000,000 in Marketing, Conservation and Production operating expenses activities in FY 1997 reflects BPA's efforts to remain competitive in the restructuring regional energy supply industry. Short-term power purchase funding requirements reflect forecast reduced demand for short-term power purchases due to anticipated improved hydrologic conditions. Long -term power purchase requirements increase to meet contractual commitments and contract termination costs as BPA scales back resource acquisitions in the face of supply-demand changes in the region. Energy conservation costs are forecast to be less in FY 1997 due to increased self-supporting conservation by the region's electric utilities. Nuclear plant costs reflect contract funding requirements and fiscal savings from increased operating efficiencies at WNP-2 in response to regional energy price competition.

1551

I. **Mission Supporting Goals and Objectives:**

This activity provides for the transmission system services of engineering, operations and maintenance for BPA's electric transmission system of 14,800 circuit miles (23,800 circuit kilometers) of lines, 400 substations, and associated power system control and communication and generation facilities with an invested cost of more than $4.8 billion. Primary strategies of this program are: 1) Maintain the safety and reliability of the transmission system; 2) increase the focus on customers; 3) optimize the transmission system; and 4) improve BPA's competitive position.

II. **Funding Schedule of Accrued Expenditures:** **(Dollars in Thousands)**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Engineering	$ 21,000	$ 19,000	$ 18,000	$ -1,000	--%
Operations	$ 35,000	$ 40,000	$ 40,000	$ --	
Maintenance	$ 83,000	$ 89,000	$ 88,000	$ -1,000	-1%
Transmission Services, Total Accrued Expenditures	$ 139,000	$ 148,000	$ 146,000	$ -2,000	-1%
Transmission Services, Total Obligations	$ 139,000	$ 148,000	$ 146,000	$ -2,000	-1%

III. **Performance Summary:**

Transmission Services operating expenses are comprised of a number of stable, ongoing efforts that meet the requirements of operating and maintaining an extensive regional transmission system. In 1995, many steps have been taken to increase the effectiveness of these efforts and reduce their costs throughout the planning and budgeting period (i.e. through FY 2001). The key activities included are:

- **Engineering:**
  R&D, Program Support, and Capital-to-Expense Adjustment: Conduct in-house transmission system research and development, including (1) studies on electro-magnetic fields and HVDC (high voltage direct current) outage reduction, (2) methods to uprate existing facilities and reduce maintenance costs, and (3) investigation of artificial intelligence/expert systems. Provide general program support activities, such as planning, budgeting, scheduling, etc. Annually, BPA analyzes its outstanding capital work orders to assess whether they should be expensed.

III. Performance Summary (Cont'd)

- **Operations:** Substation Operations - Perform operation functions necessary to provide electric service to customers and to protect the Government's investment in electric equipment. Includes equipment adjustments, switching lines and equipment during emergencies or maintenance, isolating damaged equipment, restoring service to customers, and inspecting equipment, reading meters, etc. Power System Control & Dispatching: Includes central dispatching, control, and monitoring of the electric operation of the Federal transmission system. Also includes load, frequency, and voltage control of Federal generating plants; and operation of the system control and data computers at Dittmer and Eastern Control Centers. Operations Standards & Engineering: Includes analyzing system loads, voltage levels, outage information, stability levels and other data, and making policy recommendations for system operations and related affairs. Provides for development of control center requirements for centralized automation of substations and generation and BPA participation with other utilities in developing utility operating standards and guides.

- **Maintenance:** In all aspects of maintenance, Bonneville is shifting to the implementation of reliability-centered maintenance practices. This change is focused on improving system reliability and significantly reducing maintenance costs. Primary maintenance functions include Transmission Line Maintenance: Maintain and repair nearly 24,135 km (14,800 circuit miles) of high voltage transmission lines, of which over 6,436 km (4,000 circuit miles) are 500-kV transmission EHV (extra high voltage), which is two and one-half times more labor-intensive than lower transmission voltages, although more efficient in transmission of power. Substation Maintenance: Provides for service and repair of the transmission system power equipment located at more than 400 work sites annually, and consume over 200 FTE. System Protection Maintenance: Provides for the maintenance of relaying and metering equipment used to control and protect the electrical transmission system and to meter energy transfers for the purpose of revenue billing. Additionally, field engineering services provide technical advice and assure the correct operation of power system relaying and special control systems used to support interregional energy transmission capabilities. Power System Control Maintenance: Provides for the testing, repair, and field engineering support of BPA's highly complex equipment, communications and control systems, including seven major microwave systems and other critical communications and control systems that support the power system. Nonelectric Plant Maintenance: Provides for the maintenance of BPA's nonelectric facilities. Includes site; building, and building utility maintenance; custodial services; station utility; transportation maintenance; and other maintenance service activities on BPA-owned or -leased nonelectric facilities. Maintenance Standards & Engineering: Provides for establishing, monitoring, and updating system maintenance standards, policies, and procedures; and review and update of long-range plans for maintenance of the electric power transmission system.

FY 1995 Accomplishments:

- **Engineering:** A specially assigned team developed a new approach to prioritize R&D efforts, assuring accountability, business results, and early termination of projects not meeting their forecasted target results, schedule, spending range, or application benefit potential. Capital-to-expense transfer was $4.7 million.

1553

III. Performance Summary (Cont'd)

- **Operations:** The Dispatch Training Facility (DTF) power system model is functional for Supervisory Control and Data Acquisition System (SCADA) and power system training.

- **Maintenance:** Completed reliability-centered maintenance (RCM) pilot at Alvey Substation. Based on lessons learned at Alvey, implemented RCM at Chemawa Substation. Best accomplishment of the target for System Average Interruption Frequency Index (SAIFI) in the 5-year period of FYs 1991-95. BPA achieved 4 or fewer automatic interruptions at 94.3 percent of BPA points of delivery (PODs), against a target of at least 95 percent of PODs. For System Average Interruption Duration Index (SAIDI), BPA achieved 150 minutes or less of automatic interruptions at 93.4 percent of PODs, against a target of 95 percent of PODs. Consolidated management of all training and apprentice programs, to allow for staffing and cost efficiencies. Established 11 O&M regions with a focus on increased customer service and cost management. Clarified maintenance geographic boundaries to better assure responsive customer support.

FY 1996 Accomplishments (to date and planned):

- **Engineering:** Continue activities as described in Performance Summary. Capital-to-expense transfer is expected to be approximately $2 million.

- **Operations:** Continue activities as described in Performance Summary. The Dispatcher Training Facility will be complete and provide full functional modeling of BPA's transmission power system. Transfer of staff and equipment from Eastern Control Center to the Munro Control Center is started.

- **Maintenance:** Continue activities as described in Performance Summary. Plan to implement reliability-centered maintenance (RCM) practices at one-half of Bonneville's 11 O&M regions. Continue to improve performance to meet SAIFI and SAIDI targets (see explanations of targets above).

FY 1997 Planned Accomplishments:

- **Engineering:** Continue activities as described in Performance Summary. Capital-to-expense transfer is expected to be approximately $2 million.

- **Operations:** Continue activities as described in Performance Summary. Munro Control Center fully operational.

- **Maintenance:** Continue activities as described in Performance Summary. Plan to implement reliability-centered maintenance (RCM) practices at remaining one-half of Bonneville's 11 O&M regions. Perform to meet SAIFI and SAIDI targets (see explanations of targets in 1995 accomplishments above).

Explanation of Accrued Expenditures Funding Changes FY 1996 to FY 1997:

The net decrease of $2,000,000 is the result of efforts to reduce costs to minimal levels, most notably in reduced engineering technical investigations and development, and reductions in preventive maintenance in concert with the application of BPA's reliability-centered maintenance concept.

ENVIRONMENT/FISH AND WILDLIFE - OPERATING EXPENSE

I. Mission Supporting Goals and Objectives:

This activity provides for the protection, enhancement and mitigation of Columbia River Basin fish and wildlife losses attributed to the development and operation of hydroelectric projects on the Columbia River and its tributaries pursuant to Section 4(h) of the Pacific Northwest Power Act. BPA discharges a major portion of its fish and wildlife responsibilities and reduces the Administrator's obligation, by funding projects and activities designed to consistent with the Northwest Power Planning Council's Fish and Wildlife Program. BPA is also mandated to implement measures called for under the Endangered Species Act. These measures are part of the Biological Opinions (BO) issued by the National Marine Fisheries Service (NMFS) and the U.S. Fish and Wildlife Service (USFWS) regarding the operations of the Federal Columbia River hydro system. The expenses associated with implementing the reasonable and prudent alternatives of the BOs that relate to BPA's direct fish and wildlife program are included in this budget projection. Additionally, this expense budget reflects, and is consistent with, the fish and wildlife budget agreement announced by the Administration in October 1995 that calls for BPA fish and wildlife expenses of $435 million per year on average for the period FY 1996 through FY 2001.

BPA's fish and wildlife expense funds are directed at activities that increase numbers of Columbia River Basin fish and wildlife resources including projects designed to improve juvenile fish passage at mainstream dams, resource studies, monitoring and evaluation and facility operation and maintenance. The priority for project funding will focus first on implementing the reasonable and prudent alternatives contained in the NMFS and USFWS Biological Opinions and second, on implementing the Council's Fish and Wildlife Program. A current goal of the Power Planning Council, and one supported by BPA, is that all projects funded under both Bonneville's direct program as well as the reimbursable and capital investment components of the other Federal agencies (see Fish and Wildlife Investments Crosscut Tables at front of budget document) will be reviewed and prioritized as part of a Power Planning Council initiative process. It is anticipated that such a process will be examined and considered as part of the Power Planning Council's 180-day review of governance for fish and wildlife within the Federal Columbia River Power System as called for in the FY 1996 Energy and Water Appropriations Act.

A full range of environmental and pollution prevention and abatement activities associated with operation of the Bonneville power system are conducted. The primary components are waste management/minimization, water protection, environmental investigation, and planned facility review.

II. Funding Schedule of Accrued Expenditures:

(Dollars in Thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Anadromous Fish	$ 53,000	$ 66,000	$ 69,000	$ +3,000	+5%
Resident Fish	7,000	8,000	9,000	+1,000	+13%
Wildlife	5,000	21,000	17,000	-4,000	-19%
Fish & Wildlife Operations and Maintenance	9,000	5,000	5,200	200	4%
Subtotal Fish & Wildlife Accrued Expenditures	74,000	100,000	100,000	--	--
Pollution Control & Abatement	3,000	6,000	7,000	+1000	+17%
Total, Environment/Fish & Wildlife - Accrued Expenditures	$ 77,000	$ 106,000	$ 107,000	$ +1,000	+2%
Total Environment, Fish & Wildlife Expense Obligations	$ 36,000	$ 106,000	$ 107,000	$ +1,000	+1%

III. Performance Summary:

FY 1995 Accomplishments:

- **Anadromous Fish:** Implemented Pacific Northwest Power Act responsibilities and Council Fish and Wildlife program funding based on measures installed in FY 1995 and before. Continued implementing projects which support Endangered Species Act listed species and other measures called for under the National Marine Fisheries Service Biological Opinion. Continued to implement and develop downstream migration, disease and predator control programs, artificial production methods, and habitat improvement activities.

- **Resident Fish:** Continued the study of the effects of reservoir operation on the resident fish population. Continue efforts for in-stream flow studies stock status studies, habitat improvement and monitoring and evaluation studies, white sturgeon habitat requirements consistent with Endangered Species Act requirements. Continued activities associated with species under review for possible listing as threatened or endangered under the Endangered Species Act. Continued efforts conducted in FY 1994 and prior years.

- **Wildlife:** Continued wildlife loss assessments and further developed wildlife mitigation plans and initiate wildlife mitigation actions. Initiated actions resulting from the Council's amendments to the Fish and Wildlife Program for Wildlife enhancement.

ENVIRONMENT/FISH AND WILDLIFE - OPERATING EXPENSE (Cont'd)

- **Fish & Wildlife Operations and Maintenance:** Reflects schedule for completed projects entering the O&M phase of implementation and ongoing operations and maintenance for previously completed projects..

- **Pollution Control/Abatement:** Drafted spill prevention, control and countermeasure plans for 50 facilities. Completed underground Injection Source registrations. Conducted groundwater monitoring per agreements with Oregon, Washington, and EPA. Certified all Pollution Prevention and Abatement employees who oversee the application of herbicide. Certified all employees engaged in hazardous waste operations and emergency response. Completed the plan for Interim Status Hazardous waste areas at Ross. Conducted Resource Conservation and Recovery Act and hazardous waste storage area inspections at all maintenance headquarters. Completed all annual state hazardous waste reports.

FY 1996 Accomplishments (to date and planned):

- **Anadromous Fish:** Continue to implement Pacific Northwest Power Act responsibilities and Council Fish and Wildlife program funding based on measures installed in FY 1995 and before. Continue implementing projects which support Endangered Species Act listed species and other measures called for under the National Marine Fisheries Service Biological Opinion. Continue to implement and develop downstream migration, disease and predator control programs, artificial production methods, and habitat improvement activities.

- **Resident Fish:** Continue to study the effects of reservoir operation on the resident fish population. Continue efforts for in-stream flow studies, stock status studies, habitat improvement and monitoring / evaluation studies, white sturgeon habitat requirements consistent with Endangered Species Act requirements. Continue activities associated with species under review for possible listing as threatened or endangered under the Endangered Species Act. Continued efforts conducted in FY 1995 and prior.

- **Wildlife:** Continue the FY 1995 program including funding for wildlife actions resulting from Council Fish and Wildlife Program amendments for wildlife mitigation.

- **Fish & Wildlife Operations and Maintenance:** Reflects schedule of completed projects entering the O&M phase in implementation.

- **Pollution Control/Abatement:** Continue the FY 1995 program of spill prevention, control and implementing countermeasures at necessary sites throughout the Bonneville power system. The activities include: 1) program evaluation and development, 2) environmental planning and review, 3) environmental inventory, 4) investigations, 5) prevention/remedial actions, 6) training, 7) monitoring, and 8) waste management/minimization guidance. These activities support and sustain prudent facility maintenance and accommodate compliance with environmental protection and pollution control statutes. Activities are performed on an ongoing basis and are likely to include occasional pollution incident response on the power system.

FY 1997 Planned Accomplishments:

- **Anadromous Fish:** Continue to implement Pacific Northwest Power Act responsibilities and Council Fish and Wildlife program funding based on measures installed in FY 1996 and before. Continue implementing projects which support Endangered Species Act listed species and other measures called for under the National Marine Fisheries Service Biological Opinion. Continue to implement and develop downstream migration, disease and predator control programs, artificial production methods, and habitat improvement activities.

- **Resident Fish:** Continue to study the effects of reservoir operation on the resident fish population. Continue efforts for in-stream flow studies, stock status studies, habitat improvement and monitoring / evaluation studies, white sturgeon habitat requirements consistent with Endangered Species Act requirements. Continue activities associated with species under review for possible listing as threatened or endangered under the Endangered Species Act. Continued efforts conducted in FY 1995 and prior.

- **Wildlife:** Continue the FY 1996 program including funding for wildlife actions resulting from Council Fish and Wildlife Program amendments in 1990 for wildlife mitigation.

- **Fish & Wildlife Operations and Maintenance:** Reflects schedule of completed projects entering the O&M phase in implementation.

- **Pollution Control/Abatement:** Continue the FY 1996 program of spill prevention, control and implementing countermeasures at necessary sites throughout the Bonneville power system. The activities include: 1) program evaluation and development, 2) environmental planning and review, 3) environmental inventory, 4) investigations, 5) prevention/remedial actions, 6) training, 7) monitoring, and 8) waste management/minimization guidance. These activities support and sustain prudent facility maintenance and accommodate compliance with environmental protection and pollution control statutes. Activities are performed on an ongoing basis and are likely to include occasional pollution incident response on the power system.

Explanation of Funding Changes FY 1996 to FY 1997:

Fish & Wildlife expenses for both FY 1996 and 1997 reflect the Administration's fish and wildlife budget agreement announced in October 1995 and the Pollution & Abatement increase reflects progress into the investigation phase of CERCLA sites.

BONNEVILLE POWER ADMINISTRATION

ASSOCIATED PROJECT COSTS - OPERATING EXPENSE

I. **Mission Supporting Goals and Objectives:**

This program provides funding for power related costs and liabilities of the U.S. Army Corps of Engineers and U.S. Bureau of Reclamation hydroelectric projects in the Pacific Northwest which serve many purposes. Both agencies are emphasizing efficient power production from existing facilities and improvement of the performance and availability of power units. BPA repays additional financing costs of the Federal Columbia River Power System facilities through its Interest Expense and Capital Transfer budget Programs. Pursuant to the Lower Snake River Compensation Plan (LSRCP), BPA is also responsible for the actual operations and maintenance expenditures incurred as part of the LSRCP and repays Treasury accordingly. Bonneville is also responsible for payment of annual payments to the Confederated Tribes of the Colville Reservation for their claims concerning their contribution to the production of hydropower by the Grand Coulee Dam in accordance with the Settlement Agreement between the United States and the Tribes (April, 1994). These payments in effect are equivalent to a share of the revenues from the Grand Coulee Dam.

II. **Funding Schedule of Accrued Expenditures:** (Dollars in Thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Bureau of Reclamation O&M	$ 27,000	$ 35,000	$ 35,000	$ --	--
Corps of Engineers O&M	84,000	73,000	73,000	--	--
Lower Snake River Compensation Plan (LSRCP) O&M	13,000	13,000	16,000	+3,000	23%
Colville Settlement	--0	15,000	15,000	--	--
Total Associated Project Costs - Accrued Expenditures	$ 124,000	$ 136,000	$ 139,000	$ +3,000	2%
Bureau of Reclamation Amortization Obligation	2,000	18,000	15,000	-3,000	-17%
Bureau Irrigation Assistance	--0	--0	25,000	+25,000	
Total Associated Project Costs	$ 126,000	$ 154,000	$ 179,000	$ +26,000	17%

1559

III. Performance Summary:

FY 1995 Accomplishments:

- Continued support Federal Columbia River Power System (FCRPS) project costs and work to improve relationships to improve project support and better understand project costs. This helps to maintain FCRPS system integrity and the attainment of BPA's strategic business objectives.

FY 1996 Accomplishments:

- Continue to support FCRPS project costs and work to improve relationships to improve project support and better understand project costs. This helps to maintain FCRPS system integrity and the attainment of BPA's strategic business objectives.
- Initiate compensation payments to the Confederated Colville Tribes.

FY 1997 Planned Accomplishments:

- Continue support of FCRPS project costs and improve relationships to improve project support and better understand project costs. This helps to maintain FCRPS system integrity and the attainment of BPA's strategic business objectives.
- Continue Bureau O&M project cost support through a direct funding agreement.
- Continue Corps O&M project cost support.
- Continue compensation payments to the Confederated Colville Tribes.

Explanation of Accrued Expenditures Funding Changes FY 1996 to FY 1997:

The increase of $ 3,000,000 in accrued expenditures reflects increased LSRCP O&M. Obligations increase for Bureau amortization and scheduled irrigation repayment assistance.

BONNEVILLE POWER ADMINISTRATION

INTEREST - OPERATING EXPENSE

I. Mission Supporting Goals and Objectives:

The Federal Columbia River Transmission System Act, as amended by the Pacific Northwest Power Act, and replenished by Public Law 98-50, provided borrowing authority of $3.75 billion to assist in financing the construction, acquisition, and replacement of the transmission system and to implement the Administrator's authority pursuant to the Pacific Northwest Power Act, including his authority to provide conservation measures, renewable resources and fish and wildlife. This item covers the payment of interest to the U.S. Treasury on borrowings and interest on appropriations for FCRPS investments. Interest estimates are a direct function of capital investment program levels and estimates of new plant in service. These estimates of interest payments will be updated following completion of BPA's Supplemental Rate Proposal process and finalized when BPA's proposed rates are filed with FERC. The rates are expected to be in effect at the beginning of FY 1997.

II. Funding Schedule of Accrued Expenditures: **(Dollars in Thousands)**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
BPA Bond Interest (Net)	$ 168,000	$ 144,000	$ 150,000	$ +6,000	+4%
BPA Appropriation Interest	55,000	57,000	59,000	+2,000	4%
Corps of Engineers Appropriation Interest	141,000	132,000	137,000	+5,000	4%
Lower Snake River Compensation Plan Interest	3,000	16,000	17,000	+1,000	6%
Bureau of Reclamation Appropriation Interest	31,000	30,000	31,000	+1,000	3%
Total Interest - Accrued Expenditures	$ 398,000	$ 379,000	$ 394,000	$ 15,000	4%
Total Interest - Obligations	$ 398,000	$ 379,000	$ 394,000	$ 15,000	4%

Explanation of Accrued Expenditures Funding Changes FY 1996-FY 1997:

Interest costs increase in FY 1997 to meet interest costs of existing and planned additions to capital investments in service by that year. Funding requirements reflect the repayment studies of BPA's FY 1996 Supplemental Rate Proposal. These estimates will be revised based upon funding requirements reflected in BPA's Final 1996 Rate Proposal later this year. The new rates from the 1996 rate case are expected to be in place at the start of FY 1997.

BONNEVILLE POWER ADMINISTRATION

PLANNING COUNCIL - OPERATING EXPENSE

I. **Mission Supporting Goals and Objectives:**

This activity provides for the operation of the Pacific Northwest Power and Planning Council (Council). The Pacific Northwest Act directs that expenses of the Council (subject to certain limits based on forecasted BPA power sales) shall be included in BPA's annual budget to Congress. Funding for the Council is provided by Bonneville and is recovered through Bonneville rates. It major activities center around the periodic preparation of a northwest Conservation and Electric Power Plan (a 20 year electric energy demand and resources forecast and energy conservation program) and a Columbia River Basin Fish and Wildlife Program of loss mitigation and resource enhancement actions.

II. **Funding Schedule of Accrued Expenditures:** **(Dollars in Thousands)**

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Planning Council	$ 8,000	$ 8,000	$ 8,000	$ --	--%
Total Planning Council - Operating Expense	$ 8,000	$ 8,000	$ 8,000	$ --	--%
Total Planning Council Obligations	$ 8,000	$ 8,000	$ 8,000		

1562

REIMBURSABLE

I. Mission Supporting Goals and Objectives:

This program consists of commodities, work or services furnished by BPA to Federal and non-Federal entities for which funds are received and credited to the Bonneville Fund. The projects must be beneficial under the one utility concept, to BPA operations and the Federal or non-Federal entity involved and contribute to more efficient or reliable construction, operation and maintenance of the Federal transmission system or otherwise enhance electric service to the region. The FERC Coordination Agreement payment is a reimbursable activity in which BPA serves as an agent for non-Federal hydro operators for the collection of funds due to the U.S. Treasury pursuant to Section 10(f) of the Federal Power Act and the Pacific Northwest Coordination Agreement.

II. Funding Schedule of Accrued Expenditures: (Dollars in Thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Short-Term Power Purchases	$ 12,000	$ --	$ --	$ --	--
Work Done for Others	26,000	16,000	14,000	-2,000	-13%
Federal Energy Regulatory Commission (FERC) Coordination Agreement	3,000	4,000	4,000	--	--
Total, Reimbursable Accrued Expenditures	$ 41,000	$ 20,000	$ 18,000	$ -2,000	-10%
Total Reimbursable Obligations Expenditures	$ 41,000	$ 20,000	$ 18,000	$ -2,000	-10%

1563

III. Performance Summary:

FY 1995 Accomplishments:

- **Short-term Power Purchases:** Purchased power for the Service Exchange Agreement and the Industrial Replacement Energy (IRE) Agreement.
- **Work Done For Others:** Provided construction, operation and maintenance of transmission system facilities and related utility and general support for customers and other entities.
- **FERC Coordination Agreement:** Made payments to the General Fund of the Treasury which FERC determines are due the Federal Government pursuant to Section 10(f) of the Federal Power Act for downstream benefits realized at non-Federal hydroelectric projects as a result of storage releases from upstream Federal reservoirs. BPA makes payments on behalf of the non-Federal operators and in accordance with the Pacific Northwest Coordination Agreement. These Treasury payments offset a portion of the amount BPA owes for O&M expenses at the relevant Corps of Engineers and Bureau of Reclamation projects.

FY 1996 Accomplishments (to date and planned):

- **Short-term Power Purchases:** No purchases are anticipated for the IRE on a reimbursable basis after 1995 because of the new rate structure and contracts negotiated with industrial customers. (This number may be revised later based on the 1996 rate proposal currently in process.)
- **Work Done For Others:** Continue activities in FY 1996 as described for FY 1995.
- **FERC Coordination Agreement:** Continue activities in FY 1996 as described for FY 1995.

FY 1997 Planned Accomplishments:

- **Short-term Power Purchases:** Continue activities in FY 1997 as described for FY 1996.
- **Work Done For Others:** Continue activities in FY 1997 as described for FY 1996.
- **FERC Coordination Agreement:** Continue activities in FY 1997 as described for FY 1996.

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease of $2,000,000 is the result of anticipated lower reimbursable transmission services construction and maintenance work to be done on other utilities' facilities. This program, which is not a revenue requirement of BPA's electric rates because it is funded by benefiting entities typically forecasts reduced out-year costs because the program's funding for out-years is based primarily on firm expectations of service demand. Current year funding will be adjusted to meet actual demand for service by requesting entities.

1564

BONNEVILLE POWER ADMINISTRATION

CAPITAL TRANSFERS

I. **Mission Supporting Goals and Objectives:**

This activity conveys funds to the U.S. Treasury for repayment of certain Federal Columbia River Power System costs not included in the Associated Project Costs budget. Since capital transfers are cash transactions they are not considered budget obligations.

II. **Funding Schedule:**

(Dollars in Thousands)

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
BPA Bond Amortization	$ 222,000	$ 259,000	$ 257,000	$ -2,000	-1%
3rd AC Non-Federal participant (one-time) Payment	156,000				
BPA Appropriation Amortization	0	3,000	0	-3,000	- -
Corps Appropriation Amortization	98,000	5,000	6,000	+1,000	20%
Total, Capital Transfers	$ 476,000	$267,000	$263,000	$-4,000	-1%

1565

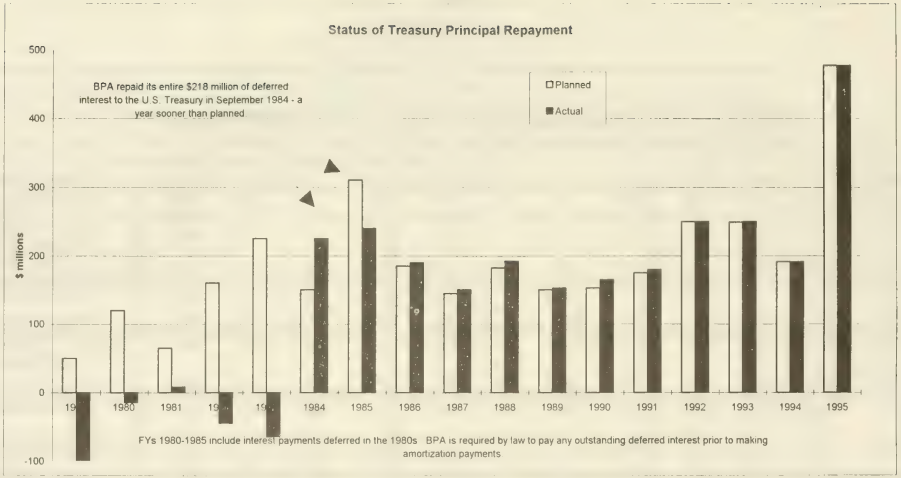
1/ This interest cost is capitalized and included in Bonneville's Transmission Services and Associated Projects Capital programs. AFUDC is financed through the sale of bonds.

2/ Includes interest on construction funding for Corps of Engineers (Corps) fish bypass facilities at Corps dams in the Columbia River Basin, including Lower Monumental, Ice Harbor, and The Dalles dams, as called for in the Fish Spillway Memorandum of Agreement approved on April 10, 1989.

3/ Total Bond and Appropriated Interest on this table differs from the amount shown in the Interest Program by the AFUDC amount as well as by the cash vs. accrual difference for FY 1995.

4/ Includes a $156 million capital transfer in FY 1995 representing an unscheduled amortization payment connected with receipts from sale of capacity to non-Federal participants in the AC Intertie transmission lines.



Status of Treasury Principal Repayment
BPA repaid its entire $218 million of deferred interest to the U.S. Treasury in September 1984 - a year sooner than planned

1/ FY 1995 is actuals. FY 1996-2001 are based on the FY1997 Congressional Budget Submittal.
Bonneville is exploring options with its customers and constituents to reduce its level of debt financing in order to both delay the exhaustion of the borrowing authority caps and improve Bonneville's debt-equity position. The options under consideration include: a) further reductions in capital spending through application of a capital budgeting process, b) revenue financing of roughly $15 million of transmission capital and $15 million of fish & wildlife capital per year, c) to the extent allowable, potentially shifting costs from the Transmission /Fish & Wildlife authority to the Conservation authority, and d) exploring alternative sources of capital, including the use of third-party financing to the greatest extent possible. The options to be adopted will be determined through process of developing the 96 Rate Case in May.

2/ FY 1995 is actual. FY 1996-2001 are based on the 1996 Supplemental Rate Proposal and will be updated following completion of Bonneville's 1996 rate case in May.

1/ Reflects BPA portion of Federal Columbia River Power Systems (FCRPS) final audited results.
2/ FY 1996 net revenue estimate is based on the 4th Quarter Review. FY 1997-2001 planned net revenues are based on the Supplemental Rate Proposal for the 1998 rate case. Actual revenues are very uncertain and are heavily influenced by customer firm loads and aluminum prices; runoff volume and constraints on operations of hydroelectric facilities in the Columbia basin; fossil fuel prices; thermal plant performance and costs; etc.
3/ Represents capital expenditures. Includes capitalized bond premiums and actual retirements.
4/ Bonneville's policy is to limit Treasury borrowing to the lower of 1) estimated cumulative capital expenditures or 2) cumulative annual borrowing authority that has been apportioned and obligated. "Deferred Borrowing Available" (line 13) reflects the amount that Bonneville could borrow under these limits. Actual Treasury borrowing (line 11) and Ending borrowing authority cap will be increased.

3/ FY 1996-2001 Treasury balance and unobligated balance estimates assume that BPA will borrow the amount needed to finance the full capital program. Actual Treasury borrowing and cash balances will be different, depending on net revenues, Treasury interest rates, and other cash management factors. Borrowing could be higher such that cash balances at the end of each year could equal total reserves.

4/ The Permanent Authority: Authority to borrow (indefinite) amount for FYs 1996-2001 reflects both BPA's capital program financing needs and either the use of, or creation of, deferred borrowing. Deferred borrowing is created when, as a cash and debt management decision, BPA uses cash from revenues to liquidate capital obligations in lieu of borrowing. This temporary use of cash on hand instead of borrowed funds creates the ability in future years to borrow money, when necessary or fiscally prudent, to finance normally revenue funded activities. Technical Executive Branch budget display and tracking requirements have modified the way BPA shows this deferred borrowing as a resource carried forward from year-to-year. This amount must therefore be added to, or subtracted from, BPA's current year borrowing authority amount, making this number a combination of capital program financing needs and the annual use, or creation of deferred borrowing. The FY 1989 Energy and Water Development Appropriations Act (P.L. 100-371 of 7/19/88) clarified that BPA has authority to incur obligations in excess of borrowing authority and cash in the BPA Fund. The two amounts which comprise the net amount on line 67.15 above are as follows:

Borrowing Authority:	FY 1995	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001
to finance capital obligations	287	355	287	324	324	396	426
to finance other obligations	0	(141)	(16)	(68)	(108)	(157)	(36)
Total Borrowing Authority (67.15)	**287**	**214**	**271**	**256**	**216**	**238**	**390**

5/ Includes amortization of BPA and Corps of Engineers appropriations and amortization of BPA bonds. Line 68.47 is referred to as capital transfers on BP-3.

PROGRAM AND PERFORMANCE

The Bonneville Power Administration (Bonneville) is the Federal electric power marketing agency in the Pacific Northwest. Bonneville markets hydroelectric power from 21 multipurpose water resource projects of the U.S. Army Corps of Engineers and 9 projects of the U.S. Bureau of Reclamation, plus some energy from non-Federal generating projects in the region. These generating resources and Bonneville's transmission system, planned by the end of FY 1997 to consist of an estimated 14,800 circuit-miles of high-voltage transmission lines and 400 substations, are operated as an integrated power system with operating and financial results combined and reported as the Federal Columbia River Power System (FCRPS). Bonneville is the largest power wholesaler in the Northwest and provides about one-half of the region's electric energy supply and about four-fifths of the region's electric power transmission capacity.

Bonneville is responsible for meeting the net firm power requirements of its requesting customers through a variety of means, including energy conservation programs, acquisition of renewable and other resources, and power exchanges with utilities both inside and outside the region.

Bonneville will finance its operations on the basis of the self-financing authority provided by the Federal Columbia River Transmission System Act of 1974 (Transmission Act) (Public Law 93-454) and the new borrowing authority provided by the Pacific Northwest Electric Power Planning and Conservation Act (Pacific Northwest Power Act) (Public Law 96-501) for energy conservation, renewable energy resources, and capital fish facilities. Authority to borrow is available to the Bonneville on a permanent, indefinite basis. The amount of borrowing outstanding at any time cannot exceed $3.75 billion.

1574

Operating Expenses:

Marketing, Conservation & Production: Provides for the orderly planning, contractual acquisition, and oversight of reliable, cost-effective resources, including fuel switching and conservation measures. Provides for forecasting regional demand; negotiating power sales and wheeling contracts, billing, and servicing these contracts; reviewing and establishing wholesale power and wheeling rates; and scheduling of power. These resources are needed to serve BPA's portion of the region's forecasted net electric load requirements.

Residential Exchange: Provides for extending the benefits of low-cost Federal power to the residential and small farm customers of investor-owned and publicly-owned utilities in accordance with the Pacific Northwest Power Act.

Transmission Services: Provides funding from revenues for electric transmission research and development and program support of the capital investment program described below for transmission services. Provides for operating an estimated 14,800 miles of line and 400 substations and for *maintaining* the facilities and equipment of the Bonneville transmission system in 1997.

Environment/Fish and Wildlife: Provides the annual expenses for environmental activities, and protection, mitigation and enhancement of fish and wildlife affected by Federal hydroelectric facilities on the Columbia River and its tributaries, in accordance with the Pacific Northwest Power Act.

Planning Council: Provides for activities of the Pacific Northwest Electric Power and Conservation Planning Council required by the Pacific Northwest Power Act.

Interest: Provides for payments to the U.S. Treasury for interest on borrowings to finance Bonneville's transmission services, conservation, capital equipment, environment, fish and wildlife, and associated projects capital programs under $3.75 billion borrowing authority provided

by the Transmission Act as amended by the Pacific Northwest Power Act and replenished by Public Law 98-50. This category also includes interest on Corps of Engineers, Bonneville, and U.S. Bureau of Reclamation appropriated debt.

Associated Project Costs: Provides for repayment of the operation and maintenance (O&M) costs of the 30 U.S. Army Corps of Engineers and U.S. Bureau of Reclamation power generating projects, amortization on the U.S. Bureau of Reclamation capital investment in power generating facilities, and irrigation assistance at Bureau facilities.

Reimbursables: Provides for reimbursable power purchases, and for services such as construction, operation and maintenance of transmission facilities when requested and financed by other entities. Also includes the coordination agreement payments to the Federal Energy Regulatory Commission.

Capital Investments:

Marketing, Conservation & Production: Provides for funding of cost-effective conservation measures.

Transmission Services.: Provides for the planning, design and construction of transmission lines, substation and control system additions, replacements, and enhancements to the FCRPS transmission system for a reliable, efficient and cost-effective regional transmission system. During FY 1997, Bonneville plans to complete construction of Bellingham Area and South Seattle-Olympia Reinforcement facilities and continue preliminary engineering of the eastern Canadian Intertie (Coulee-Oliver) along with engineering and construction of a variety of upgrades and additions to existing facilities. Provides for planning, design, and construction work to repair or replace existing transmission lines, substations, control systems, and general facilities of the FCRPS transmission system.

Capital Equipment: Provides for general purpose ADP equipment, office furniture and equipment, and capital software development in support of all Bonneville programs.

Environment/Fish and Wildlife: Provides for capital investments to implement environmental activities, and to protect, mitigate and enhance the fish and wildlife affected by Federal hydroelectric facilities on the Columbia River and its tributaries, in accordance with the Pacific Northwest Power Act.

Associated Projects - Capital: Provides for direct funding of additions, improvements, and replacements at existing Federal hydroelectric projects in the Northwest. Bonneville's FY 1997 budget includes direct funding for four Bureau of Reclamation projects and one Corps of Engineers project.

Contingencies: Although contingencies are not specifically funded, the need may arise to provide for purchase of power in low-water years; for repair and/or replacement of facilities affected by natural and human-made emergencies, including the resulting additional costs for contracting, construction, and operation and maintenance work; for unavoidable increased costs for the planned program due to necessary but unforeseen adjustments, including engineering and design changes, contractor and other claims and reallocations; or for payment of a retrospective premium adjustment in excess nuclear property insurance.

Financing: The Transmission Act provides for the use by Bonneville of all receipts, collections, and recoveries in cash from all sources, including the sale of bonds, to finance the annual budget programs of Bonneville. These receipts result primarily from the sale of power and wheeling services. The Transmission Act also provides for authority to borrow from the U.S. Treasury at rates comparable to open market rates for similar issues. As amended by the Pacific Northwest Power Act and replenished by Public Law 98-50, it allows for $3.75 billion of borrowing to be outstanding at any

time. The fiscal year 1996 capital program obligations are estimated to be $287 million. To the extent BPA capital borrowing authority is insufficient in 1997, BPA would use cash reserves generated by revenues from customers, if available, to finance some of these investments.

In 1995, Bonneville made payments to the Treasury of $1,000 million and also expects to make payments of $800 million in 1996 and $851 million in 1997. The 1997 payment will be distributed as follows: U.S. Army Corps of Engineers, U.S. Bureau of Reclamation, and U.S. Fish and Wildlife Service O&M ($123 million),Colville Settlement ($16 million), interest expense on bonds and appropriations ($394 million), allowance for funds used during construction--capitalized interest ($15 million), and amortization ($278 million), and irrigation assistance ($25 million).

Operating results: Total revenues and reimbursements are forecast at approximately $3.4 billion in 1997.

It should be noted that Bonneville's revenue forecasts are based on several critical assumptions about both the supply of and demand for Federal energy. During the operating year, deviation from the conditions assumed in a rate case may result in a variation in actual revenues of several hundred million dollars from the forecast.

FTE levels reflect DOE FY 1996/1997 staffing budget

BONNEVILLE POWER ADMINISTRATION
FTE Object Cost and Program Performance Analysis

I. Background

During the FY 1996 budget appropriations hearings the Congress indicated that it is difficult to determine where each Department of Energy employee is located and the costs associated with each. For FY 1997, the Department was instructed to include all salaries and related expenses in the program that manages the employee. Further, within each appropriation account, each organization should have one program direction line for all full-time equivalent employees (FTEs), both field and headquarters, and provide object class information for all expenses. No Federal employees are to be funded in program accounts.

II. Introduction:

These instructions apply to Bonneville as a distinct entity within the Department of Energy rather than as a program that spans the Department or an organization of the Department with installations or programs spread throughout DOE. BPA's program is a single account - the BPA Fund. This program is based upon BPA's business plan and strategic business objectives. The business-based budget is consistent with BPA's rate process and reflects regional review of program proposals by customers, rate payers and other stakeholders in BPA's program. In accord with BPA's statutory directive to present business-based budgets, the BPA program is presented as a fully funded self-financed power marketing program of interdependent capital and expense programmatic activities. Since each programmatic activity is an enterprise product or service, BPA's budget presents fully allocated program proposals that include all Federal employees, their costs, support and other program costs. Moreover, fully allocated budgets are critical to competitive pricing, business line and product margin management and accountability of BPA managers to customers, rate payers and the Congress and the Executive.

Because BPA is a governmental enterprise, its budgets present both enterprise and governmental information. Programmatic information presents the fully allocated costs of providing levels of product and service and achieving objectives against standards of performance. The program and performance schedule, budget obligational schedules, and the budget object classification schedule present BPA's enterprise budget on the basis of categories and costs of goods and services purchased by government spending and estimated rate and level of spending against authorizations and estimates.

All personnel-related costs of BPA's program for the period FY 1995-FY 1997 have been separated from the other budget object costs in the accompanying budget object crosscut. Comparison with last year's budget shows the efforts of BPA's cost-cutting competitiveness efforts. The data from this year's budget submission are summarized by the following tabulation. As supplemental information, BPA will provide under separate cover to the Committee an object cost and FTE breakdown for each of the capital and expense budget programs in the FY 1997 budget submission.

1581

BPA BUDGET OBJECT SUMMARY

	FY 1995			FY 1996			FY 1997		
	BPA	FTE $$ Only	All Other	BPA	FTE $$ Only	All Other	BPA	FTE $$ Only	All Other

III. Program Performance - Performance and Measurement

BPA program FTE and costs support the following BPA program performance. BPA provides electric power at its total system costs and annually earns revenues of more than $3 billion. BPA is the benchmark for power and transmission prices, giving ratepayers the best long-term assurance of low-cost power in the Pacific Northwest. BPA sells about 75 million megawatt-hour of electric energy annually, provides wheeling interchange and purchase-power delivery of an additional 75 million megawatts of electric energy for a total system load of more than 150 million megawatt-hours of energy. BPA builds and maintains a reliable transmission system. In fact, BPA's operate 80 percent of the region's high-voltage transmission system and serves about half of the electric needs of the Pacific Northwest' nearly 10 million-person population. BPA gives preference for Federal power to municipal systems, public utility districts and rural cooperatives. BPA provides for the participation and consultation of the public in regional plans and programs. BPA exchanges Federal power with high-cost utilities to share the regional hydro-system benefits with their residential and small farm customers. BPA protects and enhances fish wildlife by mitigating the effects resulting from Federal hydroelectric development in the Columbia River Basin. BPA provides leadership in achieving the region's cost-effective potential for energy conservation and renewable resources. BPA recovers the costs necessary to produce, transmit and conserve resources to meet electric power requirement. In addition to its other responsibilities, BPA recognizes that it has a trust responsibility that grows out the historical relationship between the Federal government and the Columbia River Treaty Tribes.

BPA's 3,272 FTE in FY 1997 will provide reliable, economic operation and maintenance of BPA's 23.8 thousand kilometer (14.8 circuit-miles) transmission system, 366 substations with a kilovolt -ampere capacity rating of 77 million kVA. This transmission system of lines, substations, control and communication facilities and associated utility and general plant are an investment of $5 billion , with gross annual revenues of more than $3 billion. BPA repays at market rates of interest the Government's capital investment of $13 billion in hydroelectric and thermal generating resources at 30 dams of the Corps of Engineers and the Bureau of Reclamation. BPA's system traversing 300,00 square miles and interconnecting electric utilities of eleven western States and British Columbia.

1582

Canada, and BPA's capital investments in energy conservation and fish and wildlife throughout the Pacific Northwest. BPA's conservation programs deliver about 50 megawatt-hours of energy saving a year and its fish and wildlife program provides for average annual economic investment of about $435 million in fish and wildlife facilities, habitat, foregone revenues and related economic costs in support of the region' fish and wildlife resources.

Program performance supports BPA's goal to:

- Provide electric power, transmission, and energy services in increasingly competitive markets.
- Support the achievement of BPA's responsibilities for fish and wildlife, energy conservation, renewable resources, and low -cost power for the region.
- Remain a low-cost producer and a creative and flexible marketer in the region, helping to ensure the economical and environmental health of the Pacific Northwest.
- Value individual diversity, entrepreneurial spirit, personal responsibility and the public service of BPA employees.

BPA's FY 1997 budget presentation reports performance measurement of accomplishment of seven strategic business objectives. These objectives, which are displayed in informative graphic displays of BPA performance in BPA's budget submission are:

Objective 1. Achieve high and continually improving customer satisfaction.

Objective 2. Increase the value of our business and share the expanded benefits.

Objective 3. Be the lowest-cost producer of power and transmission services.

Objective 4. Achieve and maintain financial integrity.

Objective 5. Keep the power system safe and reliable.

Objective 6. Invest in environmental results to sustain competitiveness.

Objective 7 Transform BPA into a high-performing, business-oriented organization.

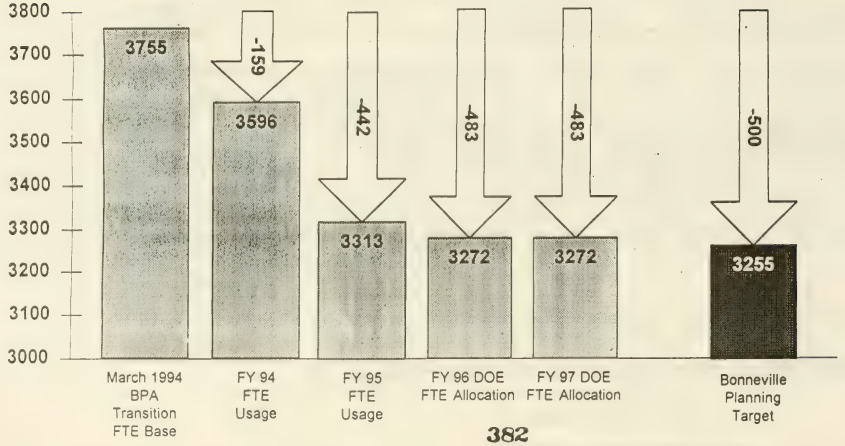
The FY 1997 sections of this tabulation include all budget costs and estimates of the BPA Fund as presented in BPA's FY 1997 Congressional budget submission. The left column of each FY 1997 section matches BPA's Object Classification Statement. In accord with the Congressional guidance, all object costs associated with Federal FTE are separated and reported in the center section of each year's section of the FY 1997 sections. No Federal FTE costs are included in the right column of each FY 1997 section. FTE costs include all BPA salaries, benefits, personnel travel, rents, utilities and printing for headquarters and field. There are no BPA FTE costs elsewhere. As supplemental information, BPA will provide budget object detail and analysis of each capital and expense program of its budget to the Committee under separate cover.

PROGRESS TOWARD 500
BONNEVILLE FTE REDUCTION GOAL
(Revised February 1, 1996)



BPA's March 1994 baseline for FY 1994 was the number of filled positions (permanent and temporary, full and part-time, including student programs charged against FTE allocations) whose incumbents were actually on board and charging against BPA FTE. BPA identified this as baselines for both employment and FTE.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
OPERATION AND MAINTENANCE, SOUTHEASTERN POWER ADMINISTRATION

PROPOSED APPROPRIATION LANGUAGE

For necessary expenses of operation and maintenance of power transmission facilities and of marketing electric power and energy pursuant to the provisions of section 5 of the Flood Control Act of 1944 (16 U.S.C. 825s), as applied to the southeastern power area, [$19,843,000] $20,900,000, to remain available until expended.

1590

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
SOUTHEASTERN POWER ADMINISTRATION
(Tabular dollars in thousands, Narrative in whole dollars)

SOUTHEASTERN POWER ADMINISTRATION

EXECUTIVE BUDGET SUMMARY

Mission

The mission of Southeastern is to market the electric power and energy generated by the Southeastern Federal reservoir projects and to encourage widespread use of the power at the lowest possible cost to consumers in the most business-like manner.

The Southeastern Power Administration markets power produced at 23 Corps of Engineers-constructed projects, to customers in eleven southeastern states giving preference in the sale of power to public bodies and cooperatives in accordance with the Flood Control Act of 1944.

Southeastern does not own or operate any transmission facilities. In the absence of transmission facilities of its own, Southeastern carries out its marketing program by utilizing the existing transmission systems of the power utilities in the area. This is accomplished through "wheeling" arrangements between Southeastern and each of the area utilities with transmission lines connected to the projects, under which the utility agrees to deliver specified amounts of Federal power to customers of the Government, and Southeastern agrees to compensate the utility for the wheeling services performed.

The GOALS of the Southeastern Power Administration are to:

1. Encourage widespread use of available Federal power; make the power available at the lowest possible rates to consumers consistent with sound business principles while repaying the Federal investment in a timely manner; and operate projects as an integrated system to provide maximum power contribution in meeting area power requirements.

2. Give preference in the sale of power to public bodies and cooperatives.

3. Utilize existing area transmission facilities to accomplish transmission of power to customers.

4. Encourage development of additional hydropower projects that are economically and environmentally feasible.

1591

The OBJECTIVES related to these goals are:

1. Actively participate in electrical industry policy formulation. Demonstrate a willingness to change policy, contracts, and operating procedures to be more responsive to our customers.

2. Accomplish timely repayment by propitious billing and collection for power delivered to customers. Hold costs to a level where future rate increases caused by escalation will be no more than 50% of consumer price index in cooperation with the preference customers and Corps of Engineers. Work with customers and Corps of Engineers on cost monitoring and work toward cost containment. Develop creative repayment strategies to integrate new funding methods into present system.

3. Formulate power rates to recover all costs of producing and transmitting power, including amortization of capital investment allocated to power, over a 50-year period and replacements over the service lives which are less than 50 years.

4. Continue to administer approximately 300 contracts which benefit more than 500 customers in a fair and effective manner that carries out the intent of contract provisions. This objective includes power delivery, contract service, billing and collection functions and daily coordination of reservoir operations to maximize power output and meet firm power commitments.

5. Southeastern's Integrated Resource Plan seeks to help customers find new ways to accomplish the goals of the Integrated Resource Plan, with emphasis on strategies that take advantage of market forces and lead to less intervention in markets.

6. Work with the Corps and preference customers to ensure funding for rehabilitation and upgrade of existing and new projects, and operation and maintenance expense.

1592

Strategy

Southeastern continues to take the lead in fostering communications with our customers through two previously established partnerships - the Southeastern Federal Power Alliance and Team Cumberland.

In July 1991, the Southeastern Federal Power Alliance was formed between Southeastern, the South Atlantic Division of the U. S. Army Corps of Engineers, and preference customers in the Georgia-Alabama-South Carolina System. Officials representing these three groups met to create a vision and develop a strategy that would foster open communication and trust. The Alliance chose the theme "Partners Advancing Clean Reliable Hydropower" to represent their efforts.

Team Cumberland was formed in February 1992. This new partnership consists of representatives of Southeastern, the Ohio River Division of the Corps of Engineers, and customers in the Cumberland System. "Partners Advancing Responsible Hydropower" was the theme chosen to represent Team Cumberland's vision.

The Southeastern Federal Power Alliance focuses its efforts on the possibility of developing a joint Southeastern-Corps of Engineers operations center with input from the customers. Both partnerships met several times during 1994 to exchange information and promote their visions.

Major Changes

Southeastern has continually revised its Strategic Plan. The plan outlines the goals and objectives Southeastern anticipates implementing during the next five years. These goals and objectives are needed to ensure the agency's vision.

1593

Southeastern expanded its capability to schedule the hourly generation of the hydroelectric projects in Southeastern's marketing area.

Southeastern supported and began fulfilling requirements for streamlining set forth in the Vice President's National Performance Review. Following the Department's goals and objectives for this process and implementing our total quality skills, a new organizational structure was established in 1994.

Southeastern's total quality process began in 1991 with associates receiving extensive training to become familiar with team building and process improvement techniques. Southeastern's efforts in Total Quality Management has lead us in improved customer service.

Southeastern expanded its Integrated Resource Plan and energy efficiency activities in the last few years. Numerous workshops and conferences were held involving customer groups and their constituent organizations. Education and training opportunities have been made available to eleven customer groups, more than any other PMA. In October 1993, Southeastern, along with Oak Ridge National Laboratory, the Department of Energy and Clayton Homes jointly funded a research project that has identified cost effective manufactured housing design modifications that result in significant improvement in energy efficiency.

ALTERNATIVE FINANCING. The Acting Administrator's testimony before the Energy & Water Development Appropriations subcommittee hearings in March 1995, included alternative funding proposals.

Southeastern has been looking into alternative financing methods which would have the preference customers pay the utilities directly for many services. Southeastern, in cooperation with its customers, is looking at the following alternatives:

Net Billing, Bill Crediting & Reimbursable Work:

1. Using alternative financing methods like bill crediting and reimbursable work, preference customers would pay utilities directly for wheeling and ancillary services. Also, to provide for power purchases for pumping operations, Southeastern's preference customers will provide advanced funding for the purchase of pumping power. The advances will be replenished from funds supplied by such customers after pumping power is delivered.

2. Also under consideration is the establishment of communications links from six master power plants to Southeastern and from Southeastern to South Atlantic Division, US Army Corps of Engineers, Atlanta, GA.

3. Finally, funding could be provided for the Corps of Engineers to improve and rehabilitate the projects. These items include an updated study of Wolf Creek Upgrade and replacing switchyard disconnects and potential transformers at the Walter F. George Project.

1594

SOUTHEASTERN POWER ADMINISTRATION

PROGRAM MISSION

The Southeastern Power Administration markets power produced at 23 Corps of Engineers-constructed projects, to customers in eleven southeastern states giving preference in the sale of power to public bodies and cooperatives in accordance with the Flood Control Act of 1944.

Southeastern markets hydroelectric power in the states of West Virginia, Virginia, North and South Carolina, Georgia, Florida, Alabama, Mississippi, Tennessee, Illinois and Kentucky.

Southeastern does not own or operate any transmission facilities. In the absence of transmission facilities of its own, Southeastern carries out its marketing program by utilizing the existing transmission systems of the power utilities in the area. This is accomplished through "wheeling" arrangements between Southeastern and each of the area utilities with transmission lines connected to the projects, under which the utility agrees to deliver specified amounts of Federal power to customers of the Government, and Southeastern agrees to compensate the utility for the wheeling services performed.

The GOALS of the Southeastern Power Administration are to:

1. Encourage widespread use of available Federal power; make the power available at the lowest possible rates to consumers consistent with sound business principles while repaying the Federal investment in a timely manner; and operate projects as an integrated system to provide maximum power contribution in meeting area power requirements.

2. Give preference in the sale of power to public bodies and cooperatives.

3. Utilize existing area transmission facilities to accomplish transmission of power to customers.

4. Encourage development of additional hydropower projects that are economically and environmentally feasible.

The OBJECTIVES related to these goals are:

1. Actively participate in electrical industry policy formulation. Demonstrate a willingness to change policy, contracts, and operating procedures to be more responsive to our customers.

2. Accomplish timely repayment by propitious billing and collection for power delivered to customers. Hold costs to a level where future rate increases caused by escalation will be no more than 50% of consumer price index in cooperation with the preference customers and Corps of Engineers. Work with customers and Corps of Engineers on cost monitoring and work toward cost containment. Develop creative repayment strategies to integrate new funding methods into present system.

3. Formulate power rates to recover all costs of producing and transmitting power, including amortization of capital investment allocated to power, over a 50-year period and replacements over the service lives which are less than 50 years.

4. Continue to administer approximately 300 contracts which benefit more than 500 customers in a fair and effective manner that carries out the intent of contract provisions. This objective includes power delivery, contract service, billing and collection functions and daily coordination of reservoir operations to maximize power output and meet firm power commitments.

5. Southeastern's Integrated Resource Plan seeks to help customers find new ways to accomplish the goals of the Integrated Resource Plan, with emphasis on strategies that take advantage of market forces and lead to less intervention in markets.

6. Work with the Corps and preference customers to ensure funding for rehabilitation and upgrade of existing and new projects, and operation and maintenance expense.

PERFORMANCE MEASURES:

Performance measures related to Southeastern Power Administration are based on outputs and outcomes. These outputs are aimed at achieving specific outcomes including, establish rates sufficient to make full and timely payment to the U. S. Treasury, maintain health and safety of all employees, develop and achieve the operation of a reliable, low-cost, environmentally sound generation system which facilitates competitive and efficient wholesale power supplies. This data is compared with past data to insure Southeastern outputs and outcomes are appropriate. Outputs include:

1. Percent variance of actual from planned principal payments to Federal investment is estimated to be zero (0).

2. Percent of full-time capacity commitments is estimated to be 92 percent.

3. Increase in the transmission costs is expected to be less than the increase in the Consumer Price Index.

4. Increase in average power costs is expected to be less that the increase in the Consumer Price Index.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Southeastern continues to take the lead in fostering communications with our customers through two previously established partnerships - the Southeastern Federal Power Alliance and Team Cumberland. The Southeastern Federal Power Alliance focuses its efforts on the possibility of developing a joint Southeastern-Corps of Engineers operations center with input from the customers. Both partnerships met several times during 1994 to exchange information and promote their visions.

- The Stonewall Jackson Project, located in West Virginia, was energized in 1994 and became Southeastern's 23rd project. The 300 kilowatt generator was added to the existing dam.

- Southeastern expanded its capability to schedule the hourly generation of the hydroelectric projects in Southeastern's marketing area.

- Southeastern supported and began fulfilling requirements for streamlining set forth in the Vice President's National Performance Review. Following the Department's goals and objectives for this process and implementing our total quality skills, a new organizational structure was established in 1994.

- Southeastern's total quality process began in 1991 with associates receiving extensive training to become familiar with team building and process improvement techniques. Southeastern's efforts in Total Quality Management has lead us in improved customer service.

- Southeastern expanded its Integrated Resource Plan and energy efficiency activities in the last few years. Numerous workshops and conferences were held involving customer groups and their constituent organizations. Education and training opportunities have been made available to eleven customer groups, more than any other PMA. In October 1993, Southeastern, along with Oak Ridge National Laboratory, the Department of Energy and Clayton Homes jointly funded a research project that has identified cost effective manufactured housing design modifications that result in significant improvement in energy efficiency.

- Southeastern has continually revised its Strategic Plan. The plan outlines the goals and objectives Southeastern anticipates implementing during the next five years. These goals and objectives are needed to ensure the agency's vision.

- Although negotiations with The Southern Company are still ongoing, it now appears that any increase in expenses will be modest and can be covered by alternative financing arrangements.

1597

Southeastern has been looking into alternative financing methods which would have the preference customers pay the utilities directly for many services. Southeastern, in cooperation with its customers, is looking at the following alternatives:

Net Billing, Bill Crediting & Reimbursable Work:

1. Using alternative financing methods like bill crediting and reimbursable work, preference customers would pay utilities directly for wheeling and ancillary services. Also, to provide for power purchases for pumping operations, Southeastern's preference customers will provide advanced funding for the purchase of pumping power. The advances will be replenished from funds supplied by such customers after pumping power is delivered.

2. Also under consideration is the establishment of communications links from six master power plants to Southeastern and from Southeastern to South Atlantic Division, US Army Corps of Engineers, Atlanta, GA.

3. Finally, funding could be provided for the Corps of Engineers to improve and rehabilitate the projects. These items include an updated study of Wolf Creek Upgrade and replacing switchyard disconnects and potential transformers at the Walter F. George Project.

Southeastern Power Administration	$ 30,533	$ 29,902	$ 27,445
Total Southeastern Power Adm.	$ 30,533	$ 29,902	$ 27,445

PROGRAM DIRECTION

I. Mission Supporting Goals and Objectives

This activity provides for: (1) scheduling the generation of power and supervision of power deliveries, (2) negotiation and administration of contracts for the sale of power and energy and establishment of rates to assure repayment of power costs, (3) general administration and support of Southeastern's power marketing program, and (4) Integrated Resources Planning program. We coordinate and cooperate with our partners to operate projects in a manner that enhances the value and reliability of hydropower. Priority is given to integrating environmental concerns and determinations into program actions. Emerging energy efficiency technologies are integrated with marketing strategies and programs.

Southeastern's FTE activities and percentages are provided as follows:

10% The Office of the Administrator is responsible for marketing hydroelectric power and energy and includes the office of Legal Affairs and the Liaison Specialist in the Power Marketing Liaison Office in Washington, DC.

30% The Finance and Marketing Division negotiates, prepares and administers contracts for the sale, purchase/interchange, and wheeling of power, formulates rates to meet repayment requirements, is responsible for budget, accounting and financial management activities, customer service, and the Integrated Resource Planning program.

28% The Human Resource and Administration Division plans, develops, coordinates and administers administrative and management activities of Southeastern. It includes activities to support mission accomplishment, ADP services, Public Information program, procurement, personnel, and supply.

32% The Power Resources Division studies power production to determine the amounts of available power and energy and studies methods of coordinating operation of present and proposed generating plants to obtain maximum utilization of water and power resources. This division schedules storage and release of water controlled by Southeastern and administers contractual operation requirements and performs billing operations for power sold by Southeastern.

1602

As of September 30, 1995, the projects represent a cumulative Federal investment, including replacements, of $1,487,116,241. Through FY 1995, $501,126,856 has been repaid in addition to $859,296,175 in interest.

Program direction has been grouped into four categories:

Salaries and Benefits provides for funding a staffing level of 40 full-time equivalents. This includes regular salary, overtime pay, annual and sick leave, and personnel benefit additives.

Travel provides for funding the transportation of Government employees, their per diem allowances and other incidental expenses related to travel for official business. It consists of travel away from official stations and local travel and transportation of persons. Various travel includes site visits, information meetings, training, speech/presentations, conferences, relocation moves, etc.

Support Services provides for funding of contract services in support of the administrative functions of the office, including maintenance of computer equipment.

Other Related Expenses costs of space rental, communications, utilities and miscellaneous charges, printing, training, tuition, contract services, financial audit of Southeastern Federal Power Program (SEFPP), operation and maintenance of equipment, supplies and materials, equipment.

II. Funding Table:

	FY 95 Comparable Appropriation	FY 96 Original Appropriation	Real & Comp Adjustments	FY 96 Comparable Appropriation	FY 97 Budget Request

* This increase is explained in Part IV of this Section.

III. Performance Summary:

FY 1995 Accomplishments:

- Continued negotiations to implement the Cumberland System Marketing Policy.
- Continued the purchase and scheduling of pumping energy, coordination between the providers of the pumping energy and the project and accounting of all transactions relative to pumping operations of the Carters Project.
- Issued the power marketing policy for the Georgia-Alabama-South Carolina System.
- Began and continued testing of all four pump back units at the Richard B. Russell Project.

- Continued to maintain power billing, collection, and payment functions for approximately 300 contracts which benefits more than 500 preference customers.
- Began control area services for the three Savannah River Projects-Hartwell, Russell and Thurmond.
- Continued negotiations pertaining to the disposition of power from the pump units at the Richard B. Russell Project.
- Issued a formal rate presentation for the Jim Woodruff Project.
- Performed continuing review of actual project operations and prepare repayment analyses of each system to determine rates.
- Southeastern's Integrated Resource Plan program cooperatively funded an energy efficiency program for manufactured housing and provided energy efficiency training for many of its preference customers.
- Marketed 6,829 GWH of clean renewable hydroelectric energy providing total proprietary receipts of $146,484,000.
- Negotiated contract extensions to existing contracts in the Duke Power Company, South Carolina Public Service Authority, South Carolina Electric & Gas Company, and The Southern Company service areas (184 contracts).

1605

FY 1996 Accomplishments (to date and planned):

- Continue negotiations for contracts in the Georgia-Alabama-South Carolina System.
- Continue the purchase and scheduling of pumping energy, coordination between the providers of the pumping energy and the project and accounting of all transactions relative to pumping operations of the Carters Project.
- Continue to maintain power billing, collection, and payment functions for approximately 300 contracts which benefits more than 500 preference customers.
- Coordinate power operations of 23 operating projects with all parties making determinations of capacity and energy availability weekly.
- Make a formal rate presentation for the Kerr-Philpott Project.
- Perform continuing review of actual project operations and prepare repayment analyses of each system to determine rates.

- Continue to provide control area services for the three Savannah River Projects-Hartwell, Russell and Thurmond.
- Continue testing of all four pump back units at the Richard B. Russell Project.
- Continued negotiations pertaining to the disposition of power from the pump units at the Richard B. Russell Project.
- The Integrated Resource Plan program will continue to provide training opportunities for our customers as well as on-site assistance, circuit riders, peer consulting and trade association consultations.
- Formulate a program proposal for using Bill Crediting and Reimbursable Funds in the payment of wheeling and other expenses.
- Marketed 7,801 GWH of clean renewable hydroelectric energy providing total proprietary receipts of $156,326,000.
- Complete negotiations and execute power contracts in The Southern Company area (128 contracts).
- Complete negotiations and execute power contracts in Cumberland System area (11 contracts).

FY 1997 Planned Accomplishments:

- Continue to maintain power billing, collection, and payment functions for approximately 300 contracts which benefits more than 500 preference customers.
- Continue the purchase and scheduling of pumping energy, coordination between the providers of the pumping energy and the project and accounting of all transactions relative to pumping operations of the Carters Project.
- Coordinate power operations of 23 operating projects with all parties making determinations of capacity and energy availability weekly.
- Perform continuing review of actual project operations and prepare repayment analyses of each system to determine rates.
- Continue to provide control area services for the three Savannah River Projects-Hartwell, Russell and Thurmond.
- The Integrated Resource Plan program will continue to offer training and related energy efficiency services to our customers.
- Identify additional opportunities for the use of Bill Crediting and Reimbursable Funds to reduce the need for appropriated funds to meet administration expenses.

- Complete negotiations pertaining to the disposition of power from the pump units at the Richard B. Russell Project.
- Marketed 7,801 GWH of clean renewable hydroelectric energy providing total proprietary receipts of $165,494,000.
- Complete negotiations and execute power contracts in the South Carolina Public Service Authority area (5 contracts).
- Complete negotiations and execute power contracts in the South Carolina Electric & Gas Company area (6 contracts).
- Complete negotiations and execute power contracts in the Duke Power Company area (46 contracts).
- Complete negotiations and execute power contracts in the Kentucky Utilities Company area (13 contracts).

IV. Explanation of Funding Changes FY 96 to FY 97:

Through FY 96, funding was under Operation and Maintenance (O&M) activity. Beginning in FY 97, all O&M funding is now being shown under Program Direction.

The increase of $105,000 is needed in Salaries and Benefits as a result of the cost of living raise and the possibility of hiring of employees to reach the authorized FTE level.

An amount of $180,000 is needed to fund Southeastern's Integrated Resource Plan activities.

The remainder of the increase, $232,000, is for the purchase of ADP equipment and software, increase in maintenance agreements, and general inflation increases.

V. Explanation of Average FTE Costs:

The average FTE costs for Southeastern are $78,000 for FY 95, $85,000 for FY 96, and $100,000 for FY 97.

These costs which are in all areas under Program Direction include salaries and benefits, official travel costs, training expenses, communications, rent of space, maintenance agreements, supplies and equipment, and contract services to carry out Southeastern's generation scheduling functions. All costs described in IV above represent an average increase of 15% for the 40 FTEs authorized.

SOUTHEASTERN POWER ADMINISTRATION

PURCHASE POWER AND WHEELING
(Tabular dollars in thousands, Narrative in whole dollars)

I. Mission Supporting Goals and Objectives:

This activity provides for the payment of amounts charged the Government under contractual arrangements for: (1) delivery of power over non-Federal systems to load centers of preference customers for the account of the Government, (2) purchase of energy to firm up Federally generated power during adverse water periods, and (3) support capacity required to meet commitments for the Jim Woodruff project under adverse water conditions. Priority is given to meeting contractual commitments and being the lead in arranging transmission of power and assisting others in planning and constructing facilities where necessary.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Purchase Power and Wheeling	$ 27,249	$ 26,430	$ 23,456	$ (2,974)	-11.0
Total, Purchase Power and Wheeling	$ 27,249	$ 26,430	$ 23,456	$ (2,974)	-11.0

1609

III. Performance Summary:

FY 1995 Accomplishments:

- Provided support to the Jim Woodruff project under adverse water conditions through purchases of energy necessary to provide support capacity .
- Continued purchases of energy to pump water into the Carters Project for later release.
- Provided for environmental testing for the Richard B. Russell Project to test the pump back units.
- Provided for payment of transmission service charges for delivery of power over non-Federal systems.

FY 1996 Accomplishments (to date and planned):

- Provide support to the Jim Woodruff project under adverse conditions through purchases of energy necessary to provide support capacity .
- Continue purchases of energy to pump water into the Carters Project for later release.
- Provide for environmental testing for the Richard B. Russell Project to test the pump back units.
- Provide for payment of transmission service charges for delivery of power for 21 of Southeastern's projects over non-Federal systems.

FY 1997 Planned Accomplishments:

- Provide support to the Jim Woodruff project under adverse water conditions through purchases of energy necessary to provide support capacity .
- Continue purchases of energy to pump water into the Carters Project for later release.
- If the present testing schedule holds and the court accepts the Corps proposals for protecting the fish during pumping operations at the Russell Project, the commercial availability of the pump-back units is planned for May 1997.
- Provide for payment of transmission service charges for delivery of power for 21 of Southeastern's projects over non-Federal systems.

1610

Explanation of Funding Changes FY 1996 to FY 1997:

Based on the assumptions listed below of utilizing net billing, reimbursable work, and bill crediting procedures, the Purchase Power and Wheeling activity is decreased by $2,974,000.

Breakdown of total needs:

Wheeling	$31,046	
Purchase Power	16,938	
		47,984
Less Net Billing	(11,467)	
Less Bill Crediting & Reimbursable Work 1/	(13,061)	
		(24,528)
Total:		$23,456

1/ Bill Crediting & Reimbursable Work:

Using alternative financing methods like bill crediting and reimbursable work, preference customers would pay utilities directly for wheeling and ancillary services. Also, to provide for power purchases for pumping operations, Southeastern's preference customers will provide advanced funding for the purchase of pumping power. The advances will be replenished from funds supplied by such customers after pumping power is delivered.

PENDING LITIGATION

SOUTHEASTERN POWER ADMINISTRATION

In Central Electric Power Cooperative, Inc., et al. vs. Southeastern Power Administration, et al., No. 3-91-2449-0 (D.C.S.C.; filed August 15, 1991), six customers in South Carolina filed suit against Southeastern in U.S. District Court requesting the court to declare illegal Southeastern's energy surcharge contained in its 1990 approved rates for the Georgia-Alabama-South Carolina System, as applied to these customers. These six customers (five cooperatives and South Carolina Public Service Authority) had declined to participate in a voluntary short-term rate increase during 1989, while 168 other customers in the system participated in the voluntary rate increase earlier than allowed by their contracts. The short-term rate change was required to offset the effects of extensive droughts in the southeast and escalating Corps of Engineers operation and maintenance costs. The energy surcharge contained in those rates was to collect the portion of the costs not recovered from these six customers, and the costs were fully collected by September 1993. The parties have filed Motions for Summary Judgment which were argued in October 1992, and a ruling by the District Court is expected at any time.

OPERATION AND MAINTENANCE, SOUTHWESTERN POWER ADMINISTRATION

PROPOSED APPROPRIATION LANGUAGE

For necessary expenses of operation and maintenance of power transmission facilities and of marketing electric power and energy, and for construction and acquisition of transmission lines, substations and appurtenant facilities, and for administrative expenses, including official reception and representation expenses in an amount not to exceed $1,500 connected therewith, in carrying out the provisions of section 5 of the Flood Control Act of 1944 (16 U.S.C. 825s), as applied to the southwestern power area, [$29,778,000] $26,900,000, to remain available until expended; in addition, notwithstanding the provisions of 31 U.S.C. 3302, not to exceed [$4,272,000] $3,787,000 in reimbursements, to remain available until expended.

1619

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET SUBMISSION
SOUTHWESTERN POWER ADMINISTRATION

EXECUTIVE BUDGET SUMMARY

Mission

As part of the Department of Energy's Energy Resources cluster, Southwestern Power Administration fulfills requirements of Section 5 of the Flood Control Act of 1944 by marketing and delivering hydroelectric power in a six-State regional area from 24 multi-purpose Federal power projects operated by the U.S. Army Corps of Engineers; by operating a reliable, efficient, and safe transmission system with maximum service to customers; by recovering the Federal power system investment plus interest and all operational costs; and by encouraging energy efficiency for the benefit of the region. The mission will be accomplished by 192 Federal employees, budget authority of $26,900,000, and average year gross revenues of $95,000,000.

Southwestern sells power at wholesale rates primarily to publicly and cooperatively owned electric utilities. To integrate the operation of the hydroelectric generating plants and to transmit power from the dams to its customers, Southwestern maintains 1,380 miles (2,225 kilometers) of high-voltage transmission lines, 24 substations, and 46 microwave and VHF radio sites. Southwestern's headquarters is in Tulsa, Oklahoma; its dispatch center is in Springfield, Missouri; and its maintenance crews are based in Jonesboro, Arkansas; Gore and Tupelo, Oklahoma; and Springfield, Missouri.

Southwestern's overall goal is to market and reliably deliver all available hydropower at the lowest possible cost in an environmentally safe manner in accordance with sound business principles.

The objectives related to this goal are:

- Increase efforts in the electric utility planning process for the region and maintain the system to meet industry reliability standards.
- Seek opportunities to make more efficient use of existing resources in the Southwest region.
- Minimize the rate impact of Federal power system costs and changes in repayment practices that would affect the economy of rural communities.
- Increase efforts in working with competing water users through participation and involvement in regional water resource planning groups and committees to balance the interests of all parties.
- Work with customer utilities to facilitate the continued implementation of an Energy Efficiency and Renewable Resource (EE/RR) program.
- Review Southwestern's organizational structure to ensure that efficiency, effectiveness, and reliability of services are provided in a manner consistent with a Total Quality Management organization.

1620

- Continue to give early consideration to the environmental consequences of all decisions.
- Take action to maintain a diverse workforce of flexible, problem-solving, empowered employees.
- Achieve system reliability that meets or exceeds contract obligations and customer expectations.

Strategy

Southwestern's mission will be accomplished by four program activities: Operations and Maintenance, Construction, Purchased Power and Wheeling, and Program Direction. In addition, Southwestern proposes to perform work for others activities by requesting reimbursable authority of $3,787,800. The attached graph reflects a funding profile by program for FY 1995 through FY 1997.

FY 1995 Accomplishments (Results of Performance Measurements)

- Southwestern attained the North American Electric Reliability Council (NERC) control performance honor roll with a compliance of 97.0 percent.
- Lost time injury frequency rate was 3.4 compared to the industry average of 2.7.
- Operating costs exceeded the rate of inflation by 2.2 percent due to an increase in maintenance of Southwestern's aging transmission system.
- Because of good water conditions, repayment of the Federal investment was ahead of the planned schedule. Approximately 36 percent of the Federal investment plus interest has been repaid.
- Total proprietary receipts were estimated at $97,006,000. Final audited financial statements received after submission of budget figures reflect actual proprietary receipts of $96,252,500. 7.8 GWh of hydroelectric energy, representing 100 percent of the total available hydropower, was marketed.

FY 1996 Accomplishments (Planned)

- Southwestern will continue to be on the NERC control performance honor roll with the performance of 95 percent or greater.
- Anticipated lost time injury frequency rate is estimated to be 2.43 compared to the industry average of 2.7.
- Operating costs are expected to stay within the rate of inflation.
- Repayment of the Federal investment will remain on or ahead of schedule.
- Total proprietary receipts are estimated at $94,567,000. An estimated 5.5 GWh of hydroelectric energy, representing 100 percent of the total average available hydropower, will be marketed.

FY 1997 Accomplishments (Planned)

- Southwestern will continue to attain the NERC honor roll.
- Lost time injury frequency rate will be comparable to the industry average.

- Operating costs will continue to stay within the rate of inflation.
- Repayment of the Federal investment will remain on or ahead of schedule.
- Total proprietary receipts are estimated at $93,839,000. An estimated 5.5 GWh of hydroelectric energy, representing 100 percent of the total average available hydroelectric power, will be marketed.

Major Changes

- By Congressional request, Southwestern has included an additional program activity called Program Direction. This activity includes all salaries and benefits, all travel, and related expenses. This activity comprises 64 percent of Southwestern's Budget Authority for FY 1997. It represents both direct and indirect program funding.

- In accordance with the Department's Strategic Alignment Initiative, Southwestern has streamlined its organization through a major reorganization of its maintenance function, support service reductions, and process improvements.

- Laws, such as the National Energy Policy Act of 1992 which requires open access to transmission systems, are changing Southwestern's priorities and the way it does business.

- To meet the challenges of budget reductions and growing requirements to upgrade facilities, Southwestern is working with its customers in evaluating alternative funding mechanisms to replace existing appropriations.

Federal Funding Staffing Profiles

- The attached profiles for funding and staffing levels reflect trends from FY 1992 through FY 1997.

SOUTHWESTERN POWER ADMINISTRATION

PROGRAM MISSION

The Southwestern Power Administration fulfills requirements of Section 5 of the Flood Control Act of 1944 by marketing and delivering hydroelectric power in a six-State regional area from 24 multipurpose Federal power projects operated by the U.S. Army Corps of Engineers; by operating a reliable, efficient, and safe transmission system with maximum service to customers; by recovering the Federal power system investment plus interest and all operational costs; and by encouraging energy efficiency for the benefit of the region. The mission will be accomplished by 192 Federal employees, a budget authority of $26,900,000, and the production of approximately $93,839,000 in proprietary receipts.

Southwestern sells power at wholesale rates primarily to publicly and cooperatively owned electric utilities. To integrate the operation of the hydroelectric generating plants and to transmit power from the dams to its customers, Southwestern maintains 1,380 miles (2,225 kilometers) of high-voltage transmission lines, 24 substations, and 46 microwave and VHF radio sites. Southwestern's headquarters is in Tulsa, Oklahoma; its dispatch center is in Springfield, Missouri; and its maintenance crews are based in Jonesboro, Arkansas; Gore and Tupelo, Oklahoma; and Springfield, Missouri.

As in previous years, the budget supports the performance of work for others activities on a fully reimbursable basis. In FY 1997, Southwestern is requesting $3,787,800 in reimbursable authority. This authority reduces Southwestern's need for new appropriations while encouraging initiatives to enhance transmission system capacity and reliability for the delivery of Federal power and to respond to emergency requests for assistance from customers.

Southwestern's program is divided into four program activities: Operations and Maintenance, Construction, Purchased Power and Wheeling, and Program Direction. These activities are described in their respective program performance summaries.

The GOAL of the Southwestern program is to:

Market and reliably deliver all available hydroelectric power at the lowest possible rates in an environmentally safe manner in accordance with sound business principles.

Program Mission: SOUTHWESTERN POWER ADMINISTRATION (Cont'd)

The OBJECTIVES related to this goal are:

- Increase efforts in the electric utility planning process for the region and maintain the system to meet industry reliability standards.
- Seek opportunities to make more efficient use of existing resources in the Southwest region.
- Minimize the rate impact of Federal power system costs and changes in repayment practices that would affect the economy of rural communities.
- Increase efforts in working with competing water users through participation and involvement in regional water resource planning groups and committees to balance the interests of all parties.
- Work with customer utilities to facilitate the continued implementation of an Energy Efficiency and Renewable Resource (EE/RR) program.
- Review Southwestern's organizational structure to ensure that efficiency, effectiveness, and reliability of services are provided in a manner consistent with a Total Quality Management organization.
- Continue to give early consideration to the environmental consequences of all decisions.
- Take action to maintain a diverse workforce of flexible, problem-solving empowered employees.
- Achieve system reliability that meets or exceeds contract obligations and customer expectations.

1627

PERFORMANCE MEASURES/OUTPUTS:

Southwestern's performance measures reflect a utility business operation and measure the entire program. Measures have been developed in the areas of marketing, repayment, safety, competitiveness, and reliability.

- Amount of Federal hydroelectric power and energy marketed as a percentage of the total available.
- Cumulative principal payments as a percentage of total Federal investment.
- Agency lost time injury frequency compared to the industry average.
- Changes in operating costs compared to change in the inflation rate.
- System performance compared to the North American Electric Reliability Council criteria.

In view of a recent Customer Survey and an initiative to compare our performance with other utilities, both public and private, Southwestern will be re-evaluating the use of these measurements in the future to determine if they best reflect customer requirements and comparable industry measurements.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- Southwestern marketed 100 percent of its available hydroelectric power. Compared to an average 5.5 GWh annually, Southwestern marketed 7.8 GWh in FY 1995.

- Southwestern has streamlined its organization through a major reorganization of its maintenance function, support services reductions, and process improvements.

- Significant benefits were provided to the rural economy of the six-State marketing area through the sale of hydropower to municipalities and rural electric cooperatives at rates which provide them the ability to compete.

- A general customer survey of external customer expectations and service performance was completed. The survey results reflected a high level of satisfaction by customers with Southwestern's performance.

- Technological changes have caused Southwestern to assume greater responsibilities in providing a variety of services to its customers and utility neighbors. Laws, such as the National Energy Policy Act of 1992 which requires open access to transmission systems, are likely to effect significant changes in Southwestern's operations and priorities.

- Customers and interconnected utilities have expressed an increased interest in developing and upgrading facilities through cooperative efforts to permit greater use of Southwestern's transmission system. To meet these growing requirements, financing alternatives are being evaluated and researched in preparation for proposing a funding mechanism to replace existing appropriations.

- Since the 1980s, Southwestern's marketing area has experienced explosive growth in the water-based recreation and tourism industry, increased demand for raw water supply sources, and an increased public interest in protection of the natural environment. Supporters of these interests are increasingly vocal and have strong public support. Southwestern is finding it increasingly difficult to accommodate competing use requests for operational change while meeting Federal contract obligations to deliver electric power and energy but is continuing to be successful in performing the role of balancing all interests and appropriately managing water resources.

SOUTHWESTERN POWER ADMINISTRATION

OPERATIONS AND MAINTENANCE

I. Mission Supporting Goals and Objectives

This activity fulfills the requirements of Section 5 of the Flood Control Act to market and deliver reliable hydroelectric power in a clean and environmentally safe, cost effective manner in a six-State regional area from 24 multi-purpose Federal power projects operated by the U.S. Army Corps of Engineers.

As of September 30, 1995, Southwestern has a cumulative repayable Federal investment, including replacements, of $1,007,331,331. Through FY 1995 $366,421,137 has been repaid in addition to $571,442,086 in interest. FY 1995 gross revenue production was estimated at $99,290,000. Final audited financial statements received after submission of budget figures reflect actual gross revenues of $98,537,000.

Estimates provided for this activity represent projected costs for service contracts, technical services, equipment, materials and supplies used in direct support of the operations and maintenance of the interconnected power system. As requested by Congress, personnel costs and associated expenses previously presented in this activity are now provided for in the Program Direction activity. Since this is the first year for the budget structure change, funding estimates and accomplishments provided are preliminary and may need adjusting in future budget submissions.

1633

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Operations and Maintenance	$ 3,654	$ 3,795	$2,793	$- 1,002	-26
Total, Operations and Maintenance	$ 3,654	$ 3,795	$2,793	$- 1,002	-26

III. Performance Summary:

FY 1995 Accomplishments:

- In support of Southwestern's operations, environmental, maintenance, transmission planning, and communications activities, the following technical studies were performed: 42 transmission planning and protective relay, 40 environmental, safety and health, 4 water resource, 4 communications and 5 maintenance.

III. Performance Summary: OPERATIONS AND MAINTENANCE (Cont'd)

- Transmission line activity: contracted 2 aerial patrols of all transmission lines. Purchased 96 poles, 408 cross arms, and 191 insulators. Completed 592 miles of right-of-way clearing.

- Substation activity: contracted mowing at 22 locations.

FY 1996 Accomplishments (to date and planned):

- In support of Southwestern's operations, environmental, maintenance, transmission planning, and communications activities, it is anticipated that the following technical studies will be performed: 40 transmission planning and protective relay, 30 environmental, safety and health, 1 water resource, 3 communications and 3 maintenance.

- Transmission line activity: complete 2 aerial patrols. Purchase the same level of pole, cross arm, and insulator replacement as in FY 1995.

- Substation activity: continue mowing at 22 locations.

FY 1997 Planned Accomplishments:

- In support of Southwestern's operations, environmental, maintenance, transmission planning, and communications activities, it is anticipated that the following technical studies will be performed: 40 transmission planning and protective relay, 30 environmental, safety and health, 3 communications and 3 maintenance.

- Transmission line activity: complete two aerial patrols. Purchase the same level of poles, cross arms, and insulators as in FY 1995.

- Substation activity: continue mowing at 22 locations.

1634

III. Performance Summary: OPERATIONS AND MAINTENANCE (Cont'd)

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease of approximately $1 million represents a reduction in right-of-way clearing contracts, test equipment, and technical studies used by operations, engineering, environmental, and maintenance personnel to determine impacts of proposed operational changes.

SOUTHWESTERN POWER ADMINISTRATION

PURCHASED POWER AND WHEELING

I. Mission Supporting Goals and Objectives:

This activity purchases non-discretionary energy as necessary to supplement hydroelectric generation to meet contractual obligations for average hydropower generation and any wheeling expenses associated with delivery of this energy to customers not directly connected to the transmission system.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
System Support Requirements	$ 0	$ 0	$ 0	$ 0	0
Other Contractual Requirements	1,503	1,630	1,095	$ - 535	- 33
Total, Purchased Power and Wheeling	$1,503	$1,630	$1,095	$ - 535	- 33

1636

III. Performance Summary:

FY 1995 Accomplishments:

- Met all power and energy commitments under power sales contracts with utility customers.
- Met 100 percent of energy purchases during average hydropower generation through the use of energy banks.

FY 1996 Accomplishments (to date and planned)

- Continue to meet all power and energy commitments under power sales contracts with utility customers.

III. Performance Summary: PURCHASE POWER AND WHEELING (Cont'd)

- Continue to rely on banked energy for energy purchases during average hydropower generation.

FY 1997 Planned Accomplishments:

- Continue to meet all power and energy commitments under power sales contracts with utility customers.
- Continue to rely on banked energy for energy purchases during average hydropower generation.

Explanation of Funding Changes FY 1996 to FY 1997:

Decrease of $535,000 is due to changes in some power sales contracts that no longer require Southwestern to wheel power and energy to customers not directly connected to Southwestern's transmission system.

1637

SOUTHWESTERN POWER ADMINISTRATION

CONSTRUCTION

I. Mission Supporting Goals and Objectives:

This activity provides for the construction, modification, and replacement of transmission, substation, switching, and communication facilities which enable Southwestern to meet operational criteria required as a member of the Southwest Power Pool. Southwestern is obligated to maintain and enhance power transmission system safety and reliability, thereby assuring continued safe, reliable delivery of power to preference customers; to encourage new initiatives for more effective use of existing regional generation resources; and to participate with non-Federal interests in joint transmission projects of benefit to the Government.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Transmission System Replacements	$5,224	$6,775	$5,700	$-1,075	-16
Transmission System Improvements	2,541	388	321	- 67	-17
Capital Equipment Not Related to Construction	642	420	33	- 387	-92
Total, Construction	$8,407	$7,583	$6,054	$-1,529	-20

III. Performance Summary:

FY 1995 Accomplishments:

Southwestern exceeded its plan to complete 21 construction projects by completing 20 replacement projects and 8 improvement projects.

III. Performance Summary: CONSTRUCTION (Cont'd)

Continued the following projects:

- Replacement of circuit breakers at three substations.
- Replacement of relay panels at eight substations.
- Installation of relay transceivers at 19 sites on the system.
- Installation of fiber optic terminal equipment at eight sites.
- Design of static wire replacement for three transmission lines.
- Installation of microwave radios at Piggott, Arkansas and Poplar Bluff, Missouri radio sites. Also replacement of the power line carrier from Jonesboro to Center Hill, Center Hill to Paragould, and Paragould to Kennett.
- Installation of telemetering equipment in the Springfield Operations Center and initiation of Supervisory Control and Data Acquisition/Energy Management System (SCADA/EMS) equipment installation.
- Installation of disconnect switches at eight sites.

Completed the following projects:

- Installation of microwave multiplex equipment at two sites.
- Installation of jumper replacement at Carthage, Missouri.
- Construction of Springfield Operations Center.
- Installation of Paragould, Arkansas oil containment trough.

1639

III. Performance Summary: CONSTRUCTION (Cont'd)

- Installation of breaker at Clarksville, Arkansas.
- Installation of capacitor bank auto tripping at Paragould and Jonesboro, Arkansas and Kennett, Missouri.

Awarded the following:

- Contract for renovations of existing buildings at Springfield, Missouri.
- New supply-and-installation contract for disconnect switches.
- Fiber optic transmission line hardware supply contract.
- Supply-and-installation contract for emergency generators.
- Western Farmers joint participation project to construct a transmission line to deliver power from the Broken Bow Dam to Southwestern's transmission system.

Capital Equipment

- Replaced eight vehicles used for the maintenance and repair of transmission system equipment and facilities.

FY 1996 Planned Accomplishments:

Construction of the following projects will be completed:

- Replacement of breakers and control cables at six sites.

1640

III. Performance Summary: CONSTRUCTION (Cont'd)

- Replacement of 13 relay panels which provides protection for lines, transformers, buswork, and capacitor banks system wide.
- Replacement of current and potential transformers at three locations in Arkansas and Missouri.
- Replacement of disconnect switches at two locations in Arkansas.
- Installation of parking lot oil containment skimming system.
- Installation of Gore-Webbers Falls terminal equipment in Oklahoma.
- Installation of SCADA/EMS system wide.
- Installation of SCADA/RTU system wide.
- Replacement of surge arresters at five locations in Arkansas and Missouri.
- Renovations to Springfield maintenance buildings in Missouri.
- Replacement of eastern Arkansas and Missouri communication facilities.
- Design of the replacement of static wire with optical ground wire in Arkansas and Missouri.
- Replacement of static wire with optical ground wire in Arkansas and Missouri.
- Installation of emergency generators at radio stations in Arkansas and Missouri.
- Design for the installation of breakers at six locations.

III. Performance Summary: CONSTRUCTION (Cont'd)

Construction contracts will be awarded for the following projects:

- Replacement of relay panels which provides protection for lines, transformers, buswork, and capacitor banks system wide.
- Replacement of control cables at Doniphan substation in Missouri.
- Installation of a secondary containment system at Weleetka Substation in Oklahoma.
- Installation of a basement drainage system at the Weleetka Substation in Oklahoma.
- Installation of digital microwave radios at three sites in Arkansas and Missouri.
- Issuance of delivery order for surge arresters at three sites in Arkansas and Missouri .
- Award of optical ground wire supply contract.
- Modifications at the Broken Bow Substation in Oklahoma.
- Issuance of delivery orders for current and potential transformers for three substations in Arkansas and Missouri.

Capital Equipment

- Replace 23 vehicles used for maintenance and repair of transmission system equipment and facilities.

FY 1997 Planned Accomplishments:

Construction of the following projects will be completed:

- Replacement of relay panels in the areas of line protection, transformer protection, buswork protection, and capacitor bank protection system wide.

1642

III. Performance Summary: CONSTRUCTION (Cont'd)

- Replacement of control cables at the Doniphan Substation in Missouri.
- Replacement of current and potential transformers at three sites in Arkansas and Missouri.
- Installation of surge arresters at three sites in Arkansas and Missouri.
- Design of relay schemes which provides protection for lines, transformers, buswork, and capacitor banks system wide
- Replacement of static wire with optical ground wire in Arkansas and Missouri.

Supply contracts will be awarded in for the following projects:

- Supply of optical ground wire and transmission hardware on four transmission line sections in Arkansas and Missouri.

Construction contracts will be awarded for the following projects:

- Installation of radio equipment at Bull Shoals, Arkansas; and Hercules and Table Rock, Missouri.
- Replacement of the analog microwave equipment at Table Rock Dam, Missouri.

Capital Equipment

- Replace one vehicle used for the maintenance and repair of transmission system equipment and facilities.

1643

III. Performance Summary: CONSTRUCTION (Cont'd)

Explanation of Funding Changes FY 1996 to FY 1997

A decrease of $1,075,000 reflects a delay to the outyears in the replacement of analog microwave equipment with digital microwave equipment which enables the new Supervisory Control and Data Acquisition (SCADA) system to monitor power deliveries to customers and assure the reliable operation of power equipment within the substation.

A decrease of $67,000 in improvements reflects the elimination of the Poplar Bluff oil containment project which would prevent the environmental consequences of soil contamination.

A decrease of $387,000 in Capital Equipment not related to Construction reflects a reduction in vehicle replacements, four tractors, two 4X4 vehicles, and one special purpose vehicle, used for field maintenance of transmission lines.

1644

SOUTHWESTERN POWER ADMINISTRATION

PROGRAM DIRECTION

I. Mission Supporting Goals and Objectives

Southwestern's Program Direction activity provides compensation and all related expenses for 192 Full-Time-Equivalents (FTE) that operate and maintain Southwestern's high voltage interconnected transmission system and associated facilities and those that plan, design, and supervise the construction of replacements, upgrades and additions (capital investments) to the transmission facilities. Also included are personnel who negotiate and administer power marketing contracts, develop wholesale power rates, develop and implement operational arrangements with competing water users, schedule and deliver power to preference customers, implement environment, safety, and health programs, and provide for general administration and management. These employees include, but are not limited to, civil, electrical and electronic engineers, high voltage linemen and electricians, power dispatchers, public utility specialists, environmental and safety specialists, and administrative staff.

Southwestern operates and maintains the transmission system to ensure an adequate supply of reliable energy in a clean and environmentally-safe, cost-effective manner throughout its six-State regional area. Southwestern achieves continuity of service by maintaining its power system at or above industry standards, rapidly restoring service following any system disturbances, mitigating adverse environmental impacts, and maximizing the revenues gained from non-firm energy sales.

Program direction has been grouped into four categories:

Salaries and Benefits provides funding for compensation for wages, cost-of-living increases, overtime, holiday and premium pay, and incentive awards. Also includes Southwestern's share of employee retirement, health and life insurance, workers' compensation for on-the-job injuries, Federal Insurance Contribution Act taxes, and Federal retirement contributions. Benefits also include relocation expenses related to permanent change of duty station, and payments for voluntary separation incentive.

Travel includes funding for the transportation of Government employees, per diem allowances, and incidental expenses incurred in the day-to-day performance of job responsibilities.

Support Services includes funding for contract services which include automated data processing, drafting, and general administrative support.

Other Related Expenses include funding for rental space, telecommunications, utilities and miscellaneous charges, printing and reproduction, training tuition fees, maintenance and repair of office equipment, supplies, materials, and non-capitalized equipment.

PROGRAM DIRECTION (Cont'd)

II. Funding Schedule:

Program Direction (dollars in thousands)	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustment	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salaries and Benefits	$11,678		$13,294	$13,294	$13,378
Travel	1,047		1,005	1,005	1,044
Support Services	2,952		2,009	2,009	2,009
Other Related Expenses	1,307		1,432	1,432	1,431
TOTAL	$16,984		$17,740	$17,740	$17,862
Full-Time Equivalents	196		195	195	192
Average	$ 87		$ 91	$ 91	$ 93

The amounts included in Program Direction represent all salaries and benefits, all travel expenses and related personnel costs for Operations and Maintenance and Construction activities. It should be noted that this value represents not only Southwestern Administrative and/or Overhead expenses but includes direct program activity costs associated with FTE usage. Since this is the first year for the budget structure change, funding estimates and accomplishments provided are preliminary and may need adjusting in future budget submissions.

III. Performance Summary:

FY 1995 Measurable Performance Activities:

- Marketed 7.8 GWh of hydroelectric energy providing an estimated total proprietary receipts of $97,006,000. Final audited financial statements received after submission of budget figures reflect actual proprietary receipts of $96,252,500.
- Continued to be on the North American Electric Reliability Council (NERC) control performance honor roll with a compliance of 97.0 percent.

III. Performance Summary: PROGRAM DIRECTION (Cont'd)

- Completed 100 percent of emergency transmission, substation, and communication system maintenance.

- Transmission line maintenance: Completed 1 ground patrol of transmission lines. Completed 71 percent of planned transmission preventive maintenance.

- Substation maintenance: Maintained 29 transformers, 161 power circuit breakers, 493 substation switches, 373 current and potential transformers, and 72 substation and radio station sites. Completed 38 of a planned 52 transformer and 143 of a planned 185 circuit breaker preventive maintenance activities. Performed routine facility corrective and preventive maintenance at all substation and radio station sites. Installed equipment was to maintain and improve system reliability. Completed the majority of environmental audit response activities.

- Communication system maintenance: Completed 80 percent of the new telemetering system installation that supports the new Supervisory Control and Data Acquisition (SCADA) system.

- Identified hazards and root causes through incident investigations and pursued error reductions and corrections to address lost time injury frequency rate of 3.4 compared to the industry average of 2.7.

- Initiated streamlining plans to reduce staffing by four FTE over the next 2 years.

- Exceeded the rate of inflation by 2.2 percent due to an increase in maintenance of Southwestern's aging transmission system.

- Completed DOE mandated Covey training based on the Stephen Covey book, *Seven Habits of Highly Effective People*, for all employees in support of the Department of Energy's Strategic Quality Goal #2 which emphasizes continuous quality improvement training for all employees through planning, attendance, and active application of Total Quality Management principles.

- Performed external customer survey as required by Executive Order No. 12862, "Setting Customer Service Standards," to survey our customers annually in order to continuously improve customer service and satisfaction. Resulted in measurable performance ratings indicating exceptionally high levels of customer satisfaction.

- Developed specific performance measurements to be used as a basis for a performance-based budgeting and comparison with industry performance.

1647

- Conducted organizational self-assessment in compliance with DOE goal for all organizations to complete baseline self-assessment by September 30, 1995. Resulted in baseline score that reflects world class performance compared to other organizations in the utility industry.

- Moved from operating support services contracts to performance based contracts with measurable objectives that impact the areas of administration, financing, information resource management, and maintenance.

- Administered a negotiated agreement with International Brotherhood of Electrical Workers (IBEW) and conducted a wage survey to ensure equity of pay scale.

- Continued random drug testing for designated positions and began administration of alcohol testing in accordance with Department of Transportation requirements.

- Completed all mandatory training in the safety and environmental areas.

- Trained 145 individuals in Total Quality Management principles.

- Acquired and installed a Procurement System which provides Electronic Data Interchange (EDI) capability that enables Southwestern to accomplish a National Performance Review (NPR) goal to conduct electronic commerce by enabling the procurement process to be conducted electronically.

- Implemented the Electronic Certification System (ECS) for automated voucher preparation, certification, transmission, and verification processes which resulted in a significant cost reduction.

- Implemented the Optical Disk Scanner project which electronically scans and stores all payment documents which reduces file space and increases time efficiency in records retrieval.

- Installed video conferencing to reduce travel expenses and improve field/headquarters coordination and productivity.

III. Performance Summary: PROGRAM DIRECTION (Cont'd)

FY 1996 Measurable Performance Activities:

- Market an estimated 5.5 GWh of hydroelectric energy providing an estimated total proprietary receipts of $94,567,000.
- Continue to be on the NERC control-performance honor roll with a performance of 95 percent or greater and remain in compliance with applicable industry reliability criteria.
- Complete 100 percent of emergency transmission, substation, and communication system maintenance.
- Transmission line maintenance: Complete 2 aerial patrols and 1 ground line patrol. Complete the same level of pole, cross arm, and insulator replacement as in FY 1995. Implement a herbicide program as part of right-of-way clearing activities and complete 230 miles of planned right-of-way clearing.
- Substation maintenance: Complete and improve on the Maintenance Management Information System (MMIS) planned preventative maintenance as performed in FY 1995 and continue installation of replacement electrical equipment to improve system reliability, complete essential general maintenance projects, and dispose of 6 of an estimated 34 polychlorinated biphenyl (PCB) contaminated equipment items. Complete the remaining environmental audit response activities with focus on continued implementation of environmental programs and procedures.
- Communication system maintenance: Complete communication and telemetering system installations for the new Supervisory Control and Data Acquisition System (SCADA), and complete four fiber optic terminal installations.
- Anticipate lost time injury frequency rate to be 2.4 compared to the industry average of 2.7. Continue corrective action activities including identification of hazards and root causes via effective incident investigations and continuous pursuit of error reduction and corrections.
- Contain operating costs to the rate of inflation.
- Continue streamlining plans to reduce FTE to 195.
- Monitor specific performance goals in support of Southwestern performance-based measurement process.
- Follow-up on process improvement actions suggested by customers in the FY 1995 survey.
- Train self-directed work teams in response to National Performance Review (NPR) initiatives to reduce supervisory ratios.

III. Performance Summary: PROGRAM DIRECTION (Cont'd)

- Continue plans to train all employees on statutory sexual harassment policies.
- Continue to provide all mandatory safety and environmental training.
- Establish policies relative to employee retraining/retention and cross-training in compliance with the National Performance Review initiatives.
- Administer a wage survey to ensure pay equity with private utilities.
- Continue to operate employee assistance programs at five locations to assist employees in dealing with job stress that may occur as the result of restructuring and downsizing.
- Operate Southwestern's portion of DOE's Retirement Buyout program - buyout was offered to six employees.
- Continue to work aggressively to decrease cost of Oklahoma Workers' Compensation Program (OWCP) by redefining jobs.
- Convert the Integrated Accounting System to current technology computing hardware and software.
- Continue Electronic Data Internet (EDI) activity which reduces procurement contract negotiations.
- Expand electronic scanning to other documents for record retrieval and storage reductions.

1650

FY 1997 Measurable Performance Activities:

- Market an estimated 5.5 GWh of hydroelectric energy providing an estimated total proprietary receipts of $93,839,000.
- Complete 100 percent of emergency transmission, substation, and communication system maintenance.
- Transmission line maintenance: Complete two aerial patrols and one ground patrol. Continue the same level of pole, cross arm, and insulator replacement as in FY 1995. Continue the herbicide program and complete 230 miles of right-of-way clearing.

III. Performance Summary: PROGRAM DIRECTION (Cont'd)

- Substation maintenance: Complete and improve on the MMIS planned preventative maintenance as performed in FY 1996. Continue installation of replacement electrical equipment to improve system reliability, complete essential general maintenance projects, and dispose of 6 of an estimated 28 PCB contaminated equipment items. Focus on continued implementation and improvement of environmental programs and procedures.

- Communication system maintenance: Complete installation of two new fiber optic terminal equipment installations. Begin replacement of existing obsolete microwave terminal equipment.

- Anticipate lost time injury frequency rate to be comparable to the industry average.

- Continue to downsize FTE level to 192 consistent with DOE's strategic alignment initiative.

- Contain operating costs to the rate of inflation.

- Monitor customer satisfaction utilizing survey methods.

- Implement follow-up actions suggested by FY 1995 customer surveys.

- Increase the number of measurable performance indicators.

- Establish guidelines on retraining/retention and cross-training in compliance with the NPR.

- Provide employee assistance programs to all employees during restructuring.

- Continue computer equipment conversion.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

Increase of $84,000 in salaries and benefits is due to the net result between increases in cost of living and overtime and decreases associated with fewer temporary employees and unfilled vacancies.

Increase of $39,000 in travel costs is the result of inflation.

Decrease of $1,000 in Other Related Expenses reflects a reduction in supplies and materials.

V. Explanation of Average FTE costs:

The average FTE costs in FY 1996 represents salaries and benefits, travel expenses, and related personnel costs such as space rental, utilities, material and supplies, telecommunications, building maintenance, and equipment for overall program implementation..

The variance of $756,000 from FY 1995 actual costs to FY 1996 budgeted estimates is due to unfilled vacancies which occurred in FY 1995.

The variance of $122,000 from FY 1996 to FY 1997 is due primarily to inflationary factors.

PENDING LITIGATION

SOUTHWESTERN POWER ADMINISTRATION

Nickle v. O'Leary. Case No. 95-C-215-B (D.Okla.; filed March 7, 1995) seeking damages in the amount of $1,000,000.00 under a Title VII sexual discrimination action. Hearing date and Pretrial Conference set for April 12, 1996. Jury trial set for May 2, 1996.

Willey v. O'Leary. Case No. 95-3154-CV-S-4 (D.Mo; filed May 3, 1995). An age discrimination case seeking judgement for promotion to the job applied for damages exceeding the sum of $50,000.00 for compensation for the loss of wages and benefits, back pay and front pay, liquidated damages, compensatory damages, punitive damages, attorney fees and costs incurred.

Vanover v. O'Leary. Case No. 95-CV-916-K (D.Okla.; filed September 13, 1995) seeking judgement in the amount of $300,000.00, for non-pecuniary losses, retroactive promotion for position denied, attorney fees and costs. Jury trial has not been set at this time.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
CONSTRUCTION, REHABILITATION, OPERATION AND MAINTENANCE, WESTERN AREA POWER ADMINISTRATION

PROPOSED APPROPRIATION LANGUAGE

(Including Transfer of Funds)

For carrying out the functions authorized by title III, section 302(a)(1)(E) of the Act of August 4, 1977 (42 U.S.C. 7101, et seq.), and other related activities including conservation and renewable resources programs as authorized, including official reception and representation expenses in an amount not to exceed $1,500, [$257,652,000] $217,891,000, to remain available until expended, of which [$245,151,000] $209,996,000 shall be derived from the Department of Interior Reclamation Fund: *Provided*, That of the amount herein appropriated, [$5,283,000] $5,432,000 is for deposit into the Utah Reclamation Mitigation and Conservation Account pursuant to title IV of the Reclamation Projects Authorization and Adjustment Act of 1992: *Provided further*, That the Secretary of the Treasury is authorized to transfer from the Colorado River Dam fund to the Western Area Power Administration [$4,556,000] $3,774,000, to carry out the power marketing and transmission activities of the Boulder Canyon project as proved in section 104(a)(4) of the Hoover Power Plant Act of 1984, to remain available until expended.

1659

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
FALCON AND AMISTAD OPERATION AND MAINTENANCE FUND, WESTERN AREA POWER ADMINISTRATION

PROPOSED APPROPRIATION LANGUAGE

For operation, maintenance, and emergency costs for the hydroelectric facilities at the Falcon and Amistad Dams, [$1,000,000] $970,000, to remain available until expended and to be derived from the Falcon and Amistad Operating and Maintenance Fund of the Western Area Power Administration, as provided in section 423 of the Foreign Relations Authorization Act, Fiscal Years 1994 and 1995.

PROGRAM MISSION

Western Area Power Administration (Western) markets Federal hydropower over a complex, interconnected transmission system to provide benefits to millions of people throughout a 1.3-million-square-mile area in the central and western United States. Western provides electric power to nearly 600 customers.

MISSION

Western's mission is to market and transmit reliable low-cost electric power, provide related services, and encourage efficient energy management in an environmentally sound manner.

Our vision: Western will meet the challenges of the changing utility industry through...

- Quality, customer-focused service
- Competitive pricing
- Excellent business practices
  - efficient, flexible, well-trained workforce
  - optimal resource use
  - streamlined processes and organization
  - strategic partnering
- Good stewardship/citizenship

Our objectives related to this vision are:

- To partner with our customers, to help them secure low-cost resources and transmission alternatives to assure stability of the long-term power supply.
- To be an organization of highly-skilled, customer-oriented people who carry out our mission in concert with our core values and leadership philosophy.
- To take an active role with other resource agencies to sustain the marketability of the Federal hydroelectric resource so that power repayment obligations will be met through power sales.
- To limit increases in annual operating expenses to no greater than the rate of inflation to assure stability in our power rates and to remain competitive in the changing utility industry

PROGRAM MISSION - WESTERN AREA POWER ADMINISTRATION (cont'd)

STRATEGY

The utility industry is changing, resulting in decreasing wholesale power costs and increased competition. Western is taking steps now to ensure that we remain competitive in the future and will generate the revenue necessary to repay the Federal power-related investment.

We are maintaining existing relationships and entering into new partnerships with our customers. We are expanding these partnerships to include the generating agencies (Bureau of Reclamation, Corps of Engineers, and International Boundary and Water Commission) to help our customers secure low-cost resources and transmission alternatives to assure stability of the long-term power supply. We have involved our power customers in our decision-making processes and in our planning processes for both annual costs and planned capital investments in our transmission system. We are working toward improved customer understanding of the development of our power rates.

We are encouraging long-term planning and efficient energy use by our customers through implementation of the Energy Planning and Management Program, development of Integrated Resource Plans as required by the Energy Policy Act of 1992, and providing technical assistance through our Energy Services program.

As a cost conscious business, Western continually seeks opportunities to improve processes and stabilize operating costs. Western has initiated a transformation process to reorganize, restructure, and reengineer Western and its processes to position the agency to meet the competitive challenge. By the end of FY 1998, Western will have reduced the number of Federal employees and the level of funding for support service contracts. We will have streamlined our processes by reducing redundancies at every level possible and by reducing bureaucracy and organizational layers. We will strive to be an organization of responsible, highly-skilled, productive, customer- and stakeholder-oriented employees who carry out our mission in concert with our core values and leadership philosophy.

Western will continue to use improved technology in power system components and test equipment to extend maintenance cycles and reduce maintenance times. We are embarking on a benchmarking process to measure our performance with the best in the industry. In the interim we have set safety, cost, and reliability goals that all Western employees are working to achieve.

In partnership with customers and key environmental groups, we will identify significant environmental issues that will involve us over the next decade. Power operations are being managed to encourage the survival of fish and wildlife, and generation is being foregone to support habitats to encourage reproduction and survival of endangered fish and birds. The environmental evaluation and clean up of about 1,100 sites will continue through 2005.

In concert with our customers, Western strives to plan future system replacement and upgrades at a level that will not cause power rate increases, but at the same time assures a reliable system that is not the "weak link" of the interconnected transmission system of the West.

Proposals for construction of new facilities must meet at least one of three criteria before being considered for construction:
- increased revenues from the new facilities must exceed the annual cost, or
- customers must benefit sufficiently to support the new facilities even if a possible rate increase may result, or
- the new facilities will be funded by others.

PROGRAM MISSION - WESTERN AREA POWER ADMINISTRATION (cont'd)

We will pursue opportunities to enhance our revenue generating capability through integration of resources and marketing ancillary services such as spinning reserves

PERFORMANCE MEASURES:

Performance measures related to Western are based on outputs and outcomes. Data for each output is collected annually. These outputs are aimed at achieving specific outcomes including establishment of rates sufficient to make full and timely payment to the U.S. Treasury; maintenance of the health and safety of all employees; and development and achievement of the operation of a reliable, low-cost, environmentally-sound power system which facilitates competitive, efficient and reliable power deliveries. Outputs include:

1. OPERATING EFFECTIVENESS: Area Control Error (ACE) percentage exceeds the National Electric Reliability Council performance standard of 90 percent. Western's FY 1995 ACE percentage was 99.0.

2. SAFETY: Western's lost workday frequency rate in FY 1995 was 0.8, which is lower than the average for the electric utility industry as reported by the National Safety Council, or 2.38 cases per 200,000 hours worked.

3. COST GROWTH: The change in actual regular operation and maintenance obligations from one year to the next is no greater than the annual rate of inflation for the same period.

4. . PRINCIPAL PAYMENT: Principal repayment to the U.S. Treasury in any given fiscal year is equal to, or greater than, the planned principal repayment.

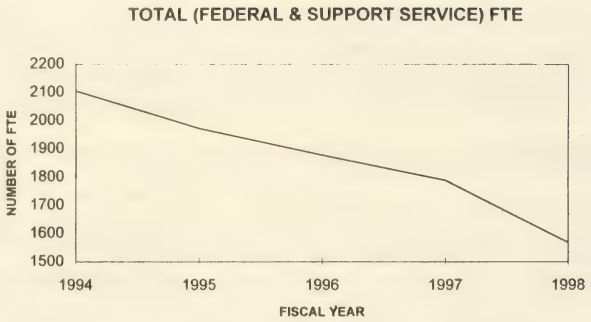
SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

- We are reducing our full time equivalent (FTE) employees from a FY 1994 level of 1,504 to 1,329 in FY 1998 or 12 percent.

- We are reducing our support service employee level from FY 1994 level of 601 to 265 in FY 1998 or 60 percent.

1663

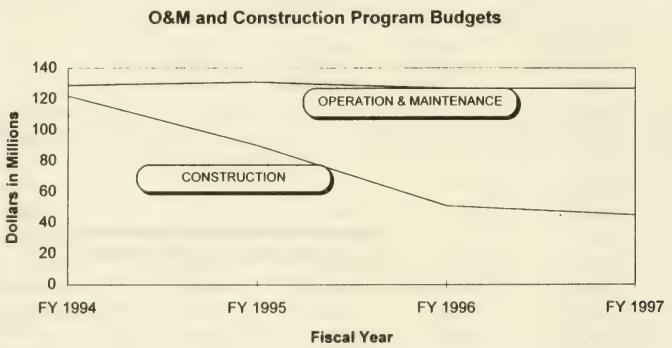
- The overall employee reduction is 24 percent, or 511 employees.



- We are limiting increases in annual operation and maintenance costs of the high voltage electrical and communications systems to no greater than the rate of inflation - our FY 1997 requested program level for Operation and Maintenance Activity is less than our FY 1994 request.

1664

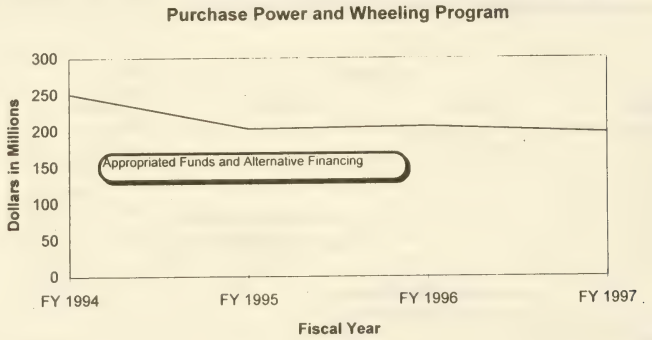
- In concert with our customers, we have prioritized,and in some cases, delayed or canceled the replacements and upgrades included in our Construction and Rehabilitation Activity. Our requested program has been reduced from $121 million in FY 1994 to $45 million in FY 1997.



- The equipment, contracts, and related expenses for the Operation and Maintenance and Construction and Rehabilitation activities continue to be separately quantified under the respective activity. However, the salary and related expenses for the Operation and Maintenance and Construction and Rehabilitation Activities are now consolidated and quantified under the heading of Program Direction in the FY 1997 budget request.

- Power purchases have been reduced from 9.0 billion kilowatt-hours in FY 1994 to 6.4 billion kilowatt-hours in FY 1997. The reason for this decrease is two-fold. First, the amount of purchases is dictated by the amount of generation available, which is contingent on water conditions in the major river systems within Western's service area. In FY 1997, reservoir levels in all of Western's service areas are expected to be near average following significant gains in FY 1995. Second, due to increased competitiveness in California markets, power customers are not requesting the full amount of energy Western has committed to provide. Alternative methods of financing continue to be pursued to reduce the need for appropriations.

The most recent agreement was for energy banking arrangements for the Parker-Davis Project in the southwest. The total Purchase Power and Wheeling program has decreased from $251 million in FY 1994 to $197 million in FY 1997. Of the $197 million, only 38 percent, or $74 million is from appropriations.



- We are striving to position ourselves for the challenges posed by a changing utility industry, with increased competition and requests for transmission access that support the Energy Policy Act of 1992.

1667

1/ On a comparable basis, $338,000 in FY 1995 and $343,000 in FY 1996 were realigned from DOE Administration to Western's Program Direction.

2/ Reflects $626,000 reduction for rescission.

3/ Reflects $3,145,000 reduction for rescission.

4/ Reflects $26,300,000 reduction for rescission and $10,000,000 transfer to Energy Supply R&D.

5/ Congressional rescission ($30,071,000) and transfer ($10,000,000) actions were reflected as a reduction in budget authority in accordance with the Congressional Base Table.

6/ Only partial transfer from DOI for permanent budget authority was made. $7,472,000 ($3,992,000 for O&M and $3,480,000 for PP&W) of permanent budget authority was included in FY 1995 Congressional Request. Only $1,800,000 was received from DOI for O&M activity.

7/ Salaries and related expenses for the Operation and Maintenance ($96,376,000) and Construction and Rehabilitation ($21,877,000) were combined under Program Direction.

8/ $961,000 of permanent authority unobligated balances was realigned from Purchase Power and Wheeling to Operation and Maintenance and subsequently realigned to Program Direction.

WESTERN AREA POWER ADMINISTRATION

PROGRAM DIRECTION

I. Mission Supporting Goals/Ongoing Responsibilities:

Western's Program Direction activity provides compensation and all related expenses for the workforce that operates and maintains Western's high voltage interconnected transmission system and associated facilities and those that plan, design, and supervise the construction of replacements, upgrades and additions (capital investments) to the transmission facilities. These employees include, but are not limited to, civil, electrical and electronic engineers, high voltage linemen and electricians, power dispatchers, public utility specialists, environmental and safety specialists, and administrative staff.

Western operates and maintains the transmission system to ensure an adequate supply of reliable energy in a clean and environmentally-safe, cost-effective manner throughout its 15-state service territory. Western achieves continuity of service by maintaining its power system at or above industry standards, rapidly restoring service following any system disturbances, mitigating adverse environmental impacts, performing clean-up activities, and maximizing the revenues gained from non-firm energy sales.

Western markets power generated at 55 hydropower plants which are operated primarily by the Bureau of Reclamation, the Corps of Engineers, and the International Boundary and Water Commission. Western also markets the United States' entitlement from the Navajo coal-fired powerplant near Page, Arizona.

In concert with our customers, Western reviews required replacements and upgrades to its existing infrastructure to sustain reliable power delivery to our customers and to contain annual maintenance expenses. The timing and scope of these replacements and upgrades are critical to assure that Western's facilities do not become the "weak link" in the interconnected system. Historically, Western pursued opportunities to join with neighboring utilities to jointly finance construction activities, which result in realized cost savings and increased efficiencies for all participants. The funding for the construction contracts and government-furnished equipment for the transmission lines, substations and related facilities is provided under the Construction and Rehabilitation activity.

Program direction has been grouped into four categories:

Salaries and Benefits: Funding for wages, including geographic differentials, pay raises (including legislated, negotiated, and administratively-determined), overtime, holiday and premium pay, and cash incentive awards for Western's Federal workforce. Also includes Western's share of employee retirement, health and life insurance, accident compensation, Federal Insurance Contribution Act taxes, and Federal Retirement Thrift Savings Plan contributions. Benefits also include relocation expenses related to permanent changes of station, and payments for former employees such as severance pay and voluntary separation incentives.

Travel: Funding for the transportation of Government employees, their per diem allowances and incidental expenses incurred in the day-to-day performance of their responsibilities.

PROGRAM DIRECTION (Cont'd)

Support Services: Funding for services which include, but are not limited to, automated data processing and general administrative support

Other Related Expenses: Funding for rental space, telecommunications, utilities and miscellaneous charges, printing and reproduction, training tuition fees, maintenance and repair of office equipment, supplies, materials, non-capitalized equipment, and the assessment of Department of Energy working capital fund expenses.

II Funding Table:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salary and Benefits	$ 70,052	$ 0	$ 78,355	$ 78,355	$73,079
Travel	6,749	0	7,504	7,504	7,341

Full Time Equivalents					
Authorized	1258		1252	1252	1190
Usage	1214		1214	1214	1190
Average Per FTE					
Appropriations/Authorized	$ 83,459		$86,744	$ 86,744	$ 87,671
Obligations/Usage	$ 85,613		$96,921	$ 96,921	$ 91,620

1676

PROGRAM DIRECTION (Cont'd)

III Performance Summary:

FY 1995 Measurable Performance Activities:

- Reduced Federal staffing by 44 fulltime equivalent (FTE) positions from the FY 1995 authorized level of 1,258.
- Initiated a transformation process to reorganize, restructure and reengineer Western and its processes to position the agency to meet the competitive challenges of today's electric utility industry. Implementation is expected to be completed by the end of FY 1998.
- Primarily as a result of reduced FTE usage, carried $13,758,000 of unobligated balances into FY 1996, including an internal reprogramming of $961,000. These funds will be used to cover the costs associated with Western's Transformation effort in FYs 1996 and 1997, such as voluntary separation incentives (buyouts), permanent changes of station, and retraining costs.
- Maintained and operated Western's high-voltage transmission system comprised of over 16,750 miles of line, 257 substations, and associated power system, control, communication, and general plant facilities.
- Provided continuing services such as system operations and load dispatching, power billing and collection, power marketing, general power resources planning, energy services, technology transfer, safety, security and emergency management activities within 13 separate power systems.
- Planned, collected field data, designed facilities and issued specifications for the projects identified in the Construction and Rehabilitation activity to enhance power system reliability and stability, and to ensure the delivery of power to customer delivery points.
- Inspected construction activities in progress (identified in the Construction and Rehabilitation activity) to ensure quality results and safe working methods.
- Continued an aggressive cost reduction program in partnership with our customers to limit annual cost increases at or below the rate of inflation.
- Continued environmental evaluation and cleanup of a portion of approximately 1,100 facility locations, including substations, communication and meter sites. Cleanup activities are expected to extend until 2005. Approximately 80 percent of the facilities have been evaluated. Evaluations at locations of known possible contamination, or of high risk were completed as a priority. Facilities remaining to be evaluated are those of low risk due to size, location, or minimal contamination potential.
- Worked collaboratively with neighboring utilities to engage in jointly-financed construction activities. This concept allows Western to take advantage of existing facility sites and transmission line rights-of-way, achieve economy of scale by developing one large project in lieu of two or more smaller projects, improve environmental planning, enhance revenues from sales using the Federal power system, and reduce Federal appropriations.

1677

PROGRAM DIRECTION (Cont'd)

FY 1995 Measurable Performance Activities (Cont'd):

- Assisted firm power customers in development and implementation of integrated resource plans in compliance with the Energy Policy Act of 1992
- As directed by the Administration, implemented an electronic commerce capability enabling electronic exchange of information with private vendors
- Planned unobligated amounts of $1,700,000 will be used to finance the FY 1997 program.

FY 1996 Measurable Performance Activities:

- Maintain fulltime equivalent usage at a level of 1214 positions, stable with the FY 1995 level, and 38 positions below Western's authorized level
- Continue regular activities, including operation, maintenance, dispatching, power billing and collection, power marketing, resource planning, energy services, technology transfers, environmental evaluations, security and emergency management activities, as described in FY 1995 Measurable Performance Activities.
- Continue planning, collecting field data, designing activities for replacement of aging facilities, and power facility development activities continue.
- Continue to conduct studies with customers and neighboring utilities for joint development of future transmission capacity, such as Estes-Mary's Lake 115-kV transmission line in Colorado, and studies to determine the best alternative to alleviate the voltage drop in northwestern Arizona
- Continue aggressive cost reduction program in partnership with our customers to limit annual cost increases at or below the rate of inflation
- Initiate implementation of improvements identified during the FY 1995 transformation process.
- Unobligated amounts of $3,000,000 will be used to finance the FY 1997 program.

FY 1997 Measurable Performance Activities:

- Will reduce fulltime equivalent usage to 1190 FTE, a reduction of 24 positions from the FY 1996 level or 57 positions below Western's previously authorized FY 1997 level.
- Regular activities, including operating, maintenance, dispatching, power billing and collection, power marketing, resource planning, energy services, technology transfers, environmental evaluations, safety, security and emergency management activities, as described in FY 1995 Measurable Performance Activities, continue.

1678

PROGRAM DIRECTION (Cont'd)

FY 1997 Measurable Performance Activities (Cont'd):

- Preconstruction activities (including power facility development costs) for future rehabilitation and upgrades of existing transmission lines and planning with the other members of the interconnected transmission system to identify the most effective transmission system improvements. For example, joint studies will continue to determine the best alternative to alleviate the voltage drop in northwestern Arizona.
- Continue working with customers and neighboring utilities to optimize resources and enhance understanding.
- Continue aggressive cost reduction program in partnership with our customers to limit annual cost increases at or below the rate of inflation.
- Implementation of improvements identified during the FY 1995 transformation process continue.

IV Explanation of Funding Changes FY 1996 to FY 1997:

Decrease of $8,634,000 in Program Direction funding from FY 1996 to FY 1997 is attributed to Western's aggressive implementation of its transformation objectives to reorganize, restructure, and reengineer the organization and its processes. The FY 1997 funding reflects a reduction of 24 positions, completion of most voluntary separation incentives (buyouts), reduced scope of support service activities, and initial reduction of facility space requirements at Golden, Colorado.

V Explanation of Average FTE Costs:

Western's Program Direction is comprised mainly of engineers and highly-skilled craftsmen directly engaged in the operation, maintenance and rehabilitation of the high-voltage interconnected transmission system. Based on anticipated obligations and estimated FTE usage, Western's average cost per FTE in FY 1997 is $91,620, or a decrease of $5,301 per FTE. The decrease is attributed to completion of a majority of activities associated with Western's transformation process, such as voluntary separation incentives (buyouts), consolidation of space and locations, and a reduced number of permanent change of station allowances.

1679

WESTERN AREA POWER ADMINISTRATION

OPERATION AND MAINTENANCE

I. Mission Supporting Goals and Objectives

Western's operation and maintenance (O&M) activity helps ensure an adequate supply of reliable energy in a clean and environmentally-safe, cost-effective manner throughout its 15-state service territory. Western achieves continuity of service by maintaining its power system at or above industry standards, rapidly restoring service following any system disturbances, mitigating adverse environmental impacts, performing clean-up activities, and maximizing the revenues gained from non-firm energy sales.

Western markets power generated at 55 hydropower plants which are operated primarily by the Bureau of Reclamation, the Corps of Engineers, and the International Boundary and Water Commission. Western also markets the United States' entitlement from the Navajo coal-fired powerplant near Page, Arizona.

Costs displayed in this section include materials and supplies, capitalized and non-capitalized equipment, and technical support services used in direct support of the O&M of the interconnected power system. Beginning with this document, the personnel costs and personnel performance accomplishments associated with the O&M activity and the Construction and Rehabilitation activity are combined and reflected in the Program Direction section of Western's budget request.

1680

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Regular Operation and Maintenance	$ 15,888	$ 16,798	$ 17,309	$ +511	+ 3
Replacements and Additions	14,405	27,584	16,697	-10,887	-39
Total Actual O&M Program	$ 30,293	$ 44,382	$ 34,006	$ -10,376	- 23
Unobligated Balances, Net	+12,355	-11,800	-1,500	+10,300	-
Total, Budget Authority	$ 42,648	$ 32,582	$ 32,506	$ -76	0
Planned Use of Prior Year Balances	0	0	+1,500	+1,500	-
Total Planned O&M Program	$ 42,648	$ 32,582	$ 34,006	$ +1,424	+4

OPERATION AND MAINTENANCE, (Cont'd)

III. Performance Summary:

FY 1995 Accomplishments:

- Supplies and materials, such as wood poles, instrument transformers, meters and relays, were procured to provide necessary resources to respond to routine and emergency situations in Western's high-voltage interconnected transmission system.
- Technical support services, such as waste management disposal, environmental impact analyses, and pest and weed control, were utilized.
- Microwave equipment was added at two sites; microwave towers were added or replaced at three sites; and monitoring units were installed at two sites.
- Five manlifts, an oil filter truck, a test trailer, a bobtail trailer, a pole trailer and two lowboy trailers were procured.
- The Sierra Nevada Region's power billing system was rehosted from an obsolete mainframe to the new corporate platform.
- A 20-MVA mobile reactor was purchased to provide temporary service should an installed reactor fail.
- Unobligated amounts of $13,300,000 will be used to finance the FY 1996 program, including $2,800,000 which is available for the Administration's FY 1996 supplemental budget request.

1681

FY 1996 Accomplishments (to date and planned):

- A supply of switches, wood poles, crossarms, bushings, batteries, and other miscellaneous materials will be maintained to enable Western to respond to routine and emergency conditions.
- Technical support services will continue to be utilized in areas such as waste management disposal, environmental impact analyses, and pest and weed control.
- Circuit breakers and/or transformers will be replaced at ten sites to maintain system reliability.
- Primary line relay sets will be replaced on twelve transmission lines in Iowa and South Dakota.
- The evaporation pond closure at the Miles City (Montana) Converter Station will be completed.
- Unobligated amounts of $1,500,000 will be used to finance the FY 1997 program.

III. Performance Summary: OPERATION AND MAINTENANCE (Cont'd)

FY 1996 Accomplishments (Cont'd):

- As part of Western's Transformation improvement process, a decision will be made whether to modify or replace the computerized financial management system.
- The staged replacement of the remote microwave alarm system will continue in North and South Dakota.
- A replacement program for transfer trip relays will begin in South Dakota.
- Two manlifts, a crane, a line truck, three trailers, two industrial tractors, and a tracked snow tractor will be replaced.
- Wide-area network equipment such as routers and security modems will be used to connect 17 field sites in the States of Iowa, Montana, North Dakota, and South Dakota, to the corporate computer for various applications.

FY 1997 Planned Accomplishments:

- Materials and supplies, including but not limited to, capacitors, guys, insulators, conductor, meters and relays, will be procured.
- Utilization of technical support services will continue.
- Beginning in FY 1997, Western is initiating a staged replacement of radios and associated equipment at substations, repeater sites, and mobile units to meet new Federal Communications Commission (FCC) and National Telecommunications and Information Administration (NTIA) regulations which require Western to move to narrow communications band spectrums by 2005.
- Circuit breakers and/or transformers will be replaced at seven sites. Foundations for circuit breakers will be replaced at two sites.
- The 40-year old Hoover Arizona-Nevada switchyard will be replaced due to safety concerns, obsolescence, and nonavailability of repair parts.
- Two mobile circuit switchers will be added. Battery banks and/or chargers will be replaced at six sites. Remote Terminal Units will be replaced at nineteen sites.
- A supervisory control and data acquisition development computer system is required for the consolidation of dispatching centers proposed as part of Western's transformation initiative.
- Two crane/manlifts, three utility trucks, a bucket truck, a line truck, a modified-boom truck, a tilt-deck trailer, and a front-end loader will be replaced or added to the system.

1682

III. **Performance Summary: OPERATION AND MAINTENANCE** (Cont'd)

FY 1997 Planned Accomplishments (Cont'd)

- Wide-area network hardware will be added; routers and disk array subsystems will be upgraded and/or expanded; and an integrated services digital network will be installed.

- Specialized test equipment, such as moisture testers, motion analyzers, penta meters, and SF6 gas percentage testers, will be replaced.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $511,000 in Regular Operation and Maintenance activities reflects increases in basic costs of supplies and materials, offset by an aggressive cost reduction program to limit annual cost increases, thereby achieving rate stability.

The decrease of $10,887,000 in Replacements and Additions is primarily attributable to completion of the modification or replacement of the financial management system and the Administration's proposed FY 1996 supplemental budget request.

WESTERN AREA POWER ADMINISTRATION

CONSTRUCTION AND REHABILITATION

I Mission Supporting Goals and Objectives

Western's construction and rehabilitation activity emphasizes replacement and upgrading of existing infrastructure to sustain reliable power delivery to our customers and to contain annual maintenance expenses. In FY 1997, Western's transmission system will have over 16,800 circuit miles of line and 258 substations. In concert with our customers, Western has reviewed the required replacements and upgrades to our facilities. Since Western's system is part of the interconnected transmission system of the West, the timing and scope of these replacements and upgrades are critical to assure that Western's facilities do not become the "weak link" in the interconnected system. Historically, Western pursued opportunities to join with neighboring utilities to jointly finance construction activities, which result in realized cost savings and increased efficiencies for all participants.

Annual replacement needs are based on condition of the facilities, availability of replacement parts, and technological advances. For example, in FY 1995, 167 of Western's 524 power transformers exceeded their service life of 40 years, and 736 miles of 7,918 miles of wood poles exceeded their service life of 50 years. Without the planned replacements, the system will deteriorate, outages to our customers will increase, and the value of our asset will decline.

This activity provides the funding for construction contracts, government-furnished equipment, and related expenses for the construction and rehabilitation of the interconnected system. Beginning with this document, the personnel costs and related expenses associated with the Construction and Rehabilitation activity and the Operation and Maintenance activity are combined and reflected in the Program Direction section of Western's budget request

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Transmission Lines and Terminal Facilities	$ 7,536	$ 4,651	$ 3,037	$ -1,614	-35
Substations	23,289	29,348	22,280	-7,068	-24
Other	3,194	6,141	4,447	-1,694	-28
Total, Actual C&R Program	$ 34,019	$ 40,140	$ 29,764	$ -10,376	-26
Unobligated Balances, Net	10,058	-18,620	-10,000	+8,620	-
Total Budget Authority	$ 44,077	$21,520	$ 19,764	$ -1,756	-8
Planned Use of Prior Year Balances	+18,115	+7,728	+10,000	+2,272	-
Total, Planned C&R Program	$ 62,192	$ 29,248	$ 29,764	$ 516	+2

1684

CONSTRUCTION AND REHABILITATION

III. Performance Summary:

FY 1995 Accomplishments:

- Completed the following projects in FY 1995:

  - Upgrade of the 40-mile Fort Peck-Wolf Point 230-kV Transmission Line (Montana)
  - Construction of the Carter Mountain-Thermopolis 230-kV Transmission Line (Wyoming)
  - Rebuild of the Watertown-Summit 115-kV Transmission Line (South Dakota)
  - Rebuild of the Big George-Carter Mountain 115-kV Transmission Line (Wyoming)
  - Replacement of circuit breakers and other equipment at Mead Substation 05 (Nevada)
  - Installation of Watertown Static Var for voltage control in eastern South Dakota area
  - Replacement of equipment at Sterling 08, Woodrow 02, Flatiron 02, Glendo 04 (Colorado); Mead 05 (Nevada); Shiprock (New Mexico); Pierre (South Dakota); Rugby 04 and Edgeley (North Dakota)
  - Demolition of Mesa Substation (Arizona)
  - Expansion of the Colorado River Storage Project microwave system
  - Construction of the Sacramento Operations Center (California), Philip Warehouse (South Dakota), Sioux City Maintenance Building (Iowa), and final modification of the Phoenix Maintenance Complex (Arizona)
  - Work for others included construction of the Kofa Substation (Arizona) to meet the needs of the Yuma Proving Ground
  - Planned unobligated balance of $7,728,000 will be used to offset the need for budget authority in FY 1996
  - Planned unobligated balance of $9,000,000 will be used to finance the FY 1997 program

- Continued the following projects in FY 1995:

  - Construction of the 256-mile, 500-kV Mead-Phoenix Transmission Line from central Arizona to southern Nevada to provide additional transmission capacity
  - Construction of the 202-mile, 500-kV Mead-Adelanto Project from southern Nevada to southern California to provide additional transmission capacity
  - Minor transmission line activities such as rerouting a small section of the Devils Lake Transmission Line (North Dakota) and relocating nine homeowners within the new realignment right-of-way of the Gering-Stegall Transmission Line (Nebraska)
  - Replacement of 50-year-old equipment at Tracy Substation 04 (California) and consolidation of the 69-kV and 230-kV into the 500-kV control room.
  - Rehabilitation of the Coolidge 07 Substation (Arizona)
  - Replacement of Western-owned series capacitor at Malin Substation (Oregon) due to age and PCB contamination
  - Replacement of four shunt reactor breakers at Mead Substation 06 (Nevada). Spare parts are non-existent
  - Upgrade of Flaming Gorge Switchyard 03 (Utah) due to Bureau of Reclamation uprates at Flaming Gorge Powerplant
  - Expansion of the Central Valley Project microwave system (California), including fiber optics
  - Replacement of the Supervisory Control and Data Acquisition Systems (SCADA) at the Phoenix Maintenance Complex (Arizona)
  - Replacement of wood poles that have failed inspection along transmission lines in the Western Division of the Pick-Sloan Missouri Basin Program

III. Performance Summary: CONSTRUCTION AND REHABILITATION (Cont'd)

- Continued the following projects in FY 1995 (Cont'd)

  - Installation of metering equipment in the Central Valley Project and telecommunications facilities for the Western Division of Pick-Sloan Missouri Basin Program
  - Replacement of power transformers, circuit breakers and fuses at Brighton 03 Substation (Colorado)
  - Installation of fire protection in eight maintenance buildings within the Western Division of the Pick-Sloan Missouri Basin Program to minimize fire hazard to employees
  - Work for others included construction of the Black Mountain-Del Bac Transmission Line (Arizona) for the Bureau of Reclamation and construction of a 2-mile 69-kV tap line and bay at Tracy Substation (California) for the Contra Costa Water District. Worked with Navajo Nation to develop a project to increase the transfer capability across the Four Corners Area. Preliminary business projections, engineering analyses, and studies for the draft Environmental Impact Statement were completed.

- Awarded construction contracts for the following projects in FY 1995:

  - Replacement of the 50-year-old Basic Substation (Nevada) with the new Henderson Substation
  - Replacement of overloaded transformers at Sioux City Substation (Iowa)
  - Replacement of breakers, control building, cables, and control boards at Williston 06 Substation (North Dakota)
  - Installation of capacitor banks, circuit switcher, and other equipment at North Cody 04 and Lovell 08 Substations (Wyoming) to prevent low voltages in the area. (Formerly referred to as the Big Horn Basin Project.)
  - Replacement of the jointly-used microwave system in the Parker-Davis Project (Arizona) to support data speeds higher than 6900 bits per second required for Hoover Dam control of Davis and Parker Dams. The Bureau of Reclamation will provide partial funding.
  - Additional vehicle and equipment storage and shop space at the Brush (Colorado) Field Office, and Redding (California) Maintenance Centers, and a storage building and pole yard at Fargo (North Dakota).
  - Contract to replace the SCADA in the Pick-Sloan Missouri Basin Program was canceled as part of Western's transformation process. Existing equipment will be modified and/or relocated within Western to meet the needs of the dispatch offices. The funding initially requested for this SCADA purchase was included in the rescission.
  - Work for others included construction of the McConnico 01 Substation (Arizona) for non-Federal entities, construction of a 3.5- mile transmission line for the city of Shasta Lake to provide a second line to the city.

FY 1996 Accomplishments (to date and planned):

- Construction of the following projects will be completed in FY 1996:

  - Construction of the 500-kV Mead-Phoenix and Mead-Adelanto Projects
  - Reroute of the Devils Lake Transmission Line

III. Performance Summary: CONSTRUCTION AND REHABILITATION (Cont'd)

- Construction of the following projects will be completed in FY 1996 (Cont'd):

  - Upgrade of Flaming Gorge Switchyard 03
  - Replacement of the SCADA at the Phoenix Maintenance Center and demolition of the old dispatch building (Arizona)
  - Replacement of equipment at Tracy 04, Coolidge 07, Mead 06, North Cody 04 and Brighton 03 Substations
  - Construction of Henderson Substation to replace Basic Substation
  - Installation of oil containment at Blue Mesa Switchyard 03 (Colorado)
  - Construction of the Redding Maintenance Facility
  - Work for others will include construction of the McConnico Substation.
  - Planned unobligations of $1,000,000 will be used to finance the FY 1997 program.

- Construction of the following projects will be continued in FY 1996:

  - Realignment of the Gering-Stegall Transmission Line
  - Replacement of equipment at Sioux City, Williston 06, Lovell 08, and Shiprock Substations
  - Replacement of Western-owned series capacitors at Malin Substation
  - Replacement of wood poles that have failed inspection in the Western Division of the Pick-Sloan Missouri Basin Program
  - Replacement of microwave systems in the Parker-Davis Project, Central Valley Project, and Pacific Northwest-Southwest Intertie Project.
  - Construction of Brush Field Office Addition and fire protection in various buildings of the Western Division of the Pick-Sloan Missouri Basin Program.
  - Work for others include construction of the Black Mountain-Del Bac Transmission Line for the Bureau of Reclamation, and working with the Navajo Nation to develop a project that will increase the transfer capability across the Four Corners Area. The Environmental Impact Statement for this project will be completed.
  - Construction contracts, as well as some preconstruction activities, have been delayed, reduced in scope, or canceled, as a result of Western's effort to work with our power customers to prioritize replacements in order to maintain a safe and reliable system and keep impacts on our power rates to a minimum. These cost savings allowed Western to meet the Congressional program reduction of $13,691,000. These savings also have allowed Western to offer $2,700,000 for reprogramming, pending Congressional approval.

- Construction contracts will be awarded for the following projects in FY 1996:

  - Replacement of 2.5 miles of the Weld-Windsor 115-kV Transmission Line (Colorado). This is a joint venture with Public Service Company of Colorado. A double circuit line will service the needs of both entities.
  - Removal of 6 miles of the Weld-Rosedale 115-kV Transmission Line (Colorado)
  - Installation of 345-kV circuit breakers and approach spans at Four Corners Switchyard (New Mexico) to increase transfer capability. This is a joint venture with Arizona Public Service, Tri-State Generation and Transmission, and Public Service of Colorado.
  - Replacement of breakers and transformers at Huron 14 Substation (South Dakota) and modification of the substation so maintenance personnel do not have to reach over an energized bus to maintain relays.

III. Performance Summary: CONSTRUCTION AND REHABILITATION (Cont'd)

- Construction contracts will be awarded for the following projects in FY 1996 (Cont'd):

  - Replacement of 40-year-old equipment at ED2 Substation (Arizona)
  - Replacement of high voltage equipment at Parker and Davis Substations (Arizona) due to age and reliability
  - Replacement of circuit breakers, reactors, and instrument transformers at Denison 08 (Iowa) and addition of 230-kV circuit breaker for proper relaying of Sioux City-Denison 230-kV Transmission Line
  - Replacement of transformers, breakers, associated disconnect switches, and other high-voltage equipment at Sidney Substation (Nebraska) and Granby 02 Substation (Colorado)
  - Removal of Derby Hill and Loveland Substations and consolidation of facilities at Valley Substation (Colorado). This will be a joint venture with other entities in the area.
  - Replacement of disconnect switches, modification of 230-kV bus, and addition of breakers at Kayenta 03 (Arizona) Substation
  - Expansion of microwave system in South Dakota. This is the backbone of the transmission system communication system
  - Additional storage for housing vehicles, electrical equipment, and supplies at Devils Lake and Fargo (North Dakota), Gering Service Center (Nebraska), and Tracy Maintenance Center (California)
  - Construction of a warehouse and equipment storage facilities at Olinda Substation (California). This is a joint venture with the California-Oregon Transmission Project participants.
  - Work for others include construction of Topock Substation for non-Federal entities (Arizona).

1688

FY 1997 Planned Accomplishments:

- The following projects will be completed in FY 1997:

  - Realignment of the Gering-Stegall Transmission Line
  - Removal of 6 miles of the Weld-Rosedale 115-kV Transmission Line
  - Replacement of series capacitors at Malin Substation
  - Replacement of transformers at Sioux City Substation
  - Replacement of equipment at Williston 06, ED2, Granby 02, Sidney, Lovell 08, Kayenta 03, and Davis Substations
  - Construction of the Gering Service Center, Devils Lake Storage, Brush Field Office Addition, and Olinda Maintenance Facility
  - Work for others include Topock Substation.

- The following projects will continue in FY 1997:

  - Replacement of equipment at Denison 08, Huron 14, Parker, Shiprock, and Four Corners Substations
  - Consolidation of Derby Hill, Loveland, and Valley Substations
  - Demolition of Basic Substation
  - Expansion of microwave systems in the Parker-Davis Project, the Central Valley Project, Pacific Northwest-Southwest Intertie Project, and the Eastern Division of the Pick-Sloan Missouri Basin Program

III. Performance Summary: CONSTRUCTION AND REHABILITATION (Cont'd)

- The following projects will continue in FY 1997 (Cont'd)

  - Replacement of wood poles that failed inspection
  - Installation of fire protection in the Loveland Area maintenance facilities
  - If the Navajo Nation obtains funding from non-Federal sources, Western will work with the Nation to develop a project which will increase the transfer capability across the Four Corners Area.

- Construction contracts will be awarded in FY 1997 for the following projects:

  - Rebuild 1.9 miles of Estes-Mary's Lake 69-kV Transmission Line (Colorado). This will be a joint venture with the Platte River Power Authority to increase the reliability to the City of Estes.
  - Rebuild 7.3 miles of the 115-kV Prospect Valley and Lost Creek Taps to provide a second line to the Prospect Valley Substation (Colorado), which will increase reliability and make maintenance of the existing line easier. This is a joint project with Tri-State Generation and Transmission.
  - Replacement of transformers at Summit Substation (South Dakota) due to leakage and build-up of nitrogen gas
  - Replacement of transformer and fuses at Holyoke and Wray Substations (Colorado)
  - Replacement of five circuit breakers, nine power circuit breakers, and nine potential transformers due to age and lack of replacement parts at Rapid City Substation (South Dakota)
  - Replacement of 40-year-old equipment at ED-4 Substation (Arizona)
  - Replacement of 43-year-old transformer, disconnect switches, and other equipment at Bonesteel Substation (South Dakota)
  - Replacement of equipment at Custer 12 Substation (Montana)
  - Replacement of reactor at Grand Island (Nebraska)
  - Replacement of the Bismarck (North Dakota) Garage and Warehouse which are the old quonset-hut style that does not meet energy conservation guidelines, Huron (South Dakota) O&M Service Center, and modification or replacement of Western's Craft Training Center facility.
  - Replacement of transformer and associated work at Rudyard Substation (Montana)

Explanation of Funding Changes FY 1996 to FY 1997:

The Mead-Phoenix and Mead-Adelanto Projects are complete and in-service in FY 1996. This results in a decrease of $2,572,000 in FY 1997. The remaining decrease of $8,804,000 is primarily due to Western's effort to closely scrutinize all construction projects, in concert with our customers. Replacements are planned at a level that will not cause power rate increases, but at the same time assure a safe and reliable transmission system.

WESTERN AREA POWER ADMINISTRATION

PURCHASE POWER AND WHEELING

I. Mission Supporting Goals and Objectives

The Purchase Power and Wheeling program obtains electrical resources and transmission capability to firm up the Federal hydropower supplies needed to meet Western's contractual obligations. Transmission wheeling services are also purchased when a third party's transmission lines are needed to deliver Federal power to Western's customers. The amount of purchases is dictated by the amount of generation available, which is contingent on water conditions in the major river systems within Western's service area. In FY 1997, reservoir levels in all of Western's service areas are expected to be near average following significant gains in FY 1995. Increased competitiveness in the California market is also impacting the purchase power program as Central Valley Project customers are not requesting the full amount of energy Western has committed to provide. Western-wide power purchases are expected to decrease from about 7.4 billion kilowatt-hours in FY 1995 to 6.4 billion kilowatt-hours in FY 1997.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Central Valley Project	$ 61,002	$ 69,498	$ 63,540	$ -5,958	-9

III. Performance Summary:

FY 1995 Accomplishments:

- Central Valley Project (CVP) - Purchased energy, capacity, and wheeling services necessary for Western to meet its contractual commitments.

  Lower customer loads experienced in FY 1994 continued in FY 1995. Water conditions also improved leading to above average generation during the last nine months of the fiscal year. Energy purchases amounted to 3,830 GWh, down from the estimate of 4,788 GWh. Western proposed a $10,000,000 reduction to its FY 1995 program because of the reduced purchases. The $10,000,000 was rescinded in FY 1995.

III. Performance Summary: PURCHASE POWER AND WHEELING (Cont'd)

FY 1995 Accomplishments (Cont'd):

Non-firm purchases from northwest and instate suppliers were balanced with purchases from the Pacific Gas and Electric (PG&E) energy bank account no. 2 (EA2). The outstanding balance of the EA2 is being reduced at a rate which minimizes costs and maximizes rate stability through year 2004, the life of the PG&E contract.

In FY 1994, PG&E filed a rate schedule change with the Federal Energy Regulatory Commission (FERC). This filing established cost-based rates for Western's withdrawals of energy from EA2 during the 1985-92 period. As a result of this change, a credit of $39 million was available to finance PG&E's energy bills to Western in FY 1994 and FY 1995. Western's FY 1995 request for new budget authority was reduced accordingly.

Alternative methods of financing provided $101,127,000, or 62% of the CVP purchase power and wheeling program.

- Pick-Sloan Missouri Basin Program - Purchased energy and wheeling services to meet power delivery obligations for the Pick-Sloan Missouri Basin Program, including the Fryingpan-Arkansas Project.

Alternative financing methods provided $33,413,000, or 83% of the Pick-Sloan Missouri Basin purchase power and wheeling program.

- Other Projects - Purchased energy for the Parker-Davis and Boulder Canyon Projects. Generation at Hoover, Parker, and Davis Powerplants continued to be restricted by ongoing environmental studies at the upstream Glen Canyon Dam.

In FY 1995, alternative methods of financing were expected to provide $1,500,000 for Parker-Davis, or 25% of the total "Other Projects" program estimate of $5,980,000. However, these methods are no longer being pursued as Western has entered into resource pooling arrangements with neighboring utilities to provide for the banking and exchange of energy services at the Parker-Davis Project. The arrangement has significantly reduced the FY 1995 and outyear Parker-Davis Projects purchase power requirement.

FY 1996 Accomplishments (to date and planned):

- Central Valley Project - Continue purchasing energy, capacity, and wheeling services to meet Western's contractual commitments.

Purchases are anticipated to be 3,498 GWh. This reflects average water conditions and continued lower customer loads. The lower loads reflect the increased competitiveness in the California energy market. In response to the industry competition, Western has begun negotiations with its long-term firm power supply contractors in order to reduce the cost of these purchases, which are above current market rates. For example, PG&E capacity rates will be lowered in June 1996.

CVP purchase estimates assume that the Bureau of Reclamation will complete the Shasta Dam temperature control device (TCD) early enough in

III. **Performance Summary: PURCHASE POWER AND WHEELING** (Cont'd)

FY 1996 Accomplishments (Cont'd)

FY 1996 to eliminate power purchases normally required during bypass operations. However, indications are the TCD may not be in service until FY 1997. The amount of bypasses anticipated in FY 1996 is dependent on downstream temperature requirements for endangered chinook salmon Since FY 1988, the bypasses have ranged from 63 GWh to 435 GWh at a cost of $1.7 million to $12.6 million a year. Changes in the operation of the CVP or additional requirements for environmental concerns could reduce the amount of generation available for marketing, and increase the amount of purchases required to meet contractual commitments.

Alternative methods of financing are expected to provide $90,062,000, or 56% of the CVP purchase power and wheeling program. The reduction in alternative financing arises from a 21% decrease in Western's composite rate starting in October 1995. The rate decrease reduces the revenue base available to Western for bill crediting, net billing, and reimbursable activities.

- Pick-Sloan Missouri Basin Program - The purchase power requirement will decrease based on forecasts of near-normal reservoir levels and average inflows.

Increased appropriations were requested to pay increased wheeling expenses for transmission of energy generated from the Mt. Elbert Powerplant.

Alternative methods of financing are expected to provide $31,886,000, or 74% of the Pick-Sloan Missouri Basin purchase power and wheeling program.

- Other Projects - Continue purchasing energy for the Parker-Davis and Boulder Canyon Projects.

Western will continue resource pooling arrangements providing for banking and exchange of energy services with neighboring utilities to reduce the Parker-Davis Project power purchases by more than 60 percent.

Western has completed advance funding arrangements with some Boulder Canyon Project customers, reducing the need to request permanent budget authority for purchase power requirements at the Boulder Canyon Project. Permanent authority of $961,000 carried forward from FY 1995 was realigned from purchase power and wheeling to Boulder Canyon operation and maintenance. The permanent authority request in FY 1997 for purchase power and wheeling has been eliminated.

FY 1997 Planned Accomplishments:

- Central Valley Project - Continue purchasing energy, capacity, and wheeling services to meet Western's contractual commitments.

Purchases are anticipated to be 3,213 GWh. This reflects average water conditions, continued lower customer loads, and reduction of purchases from the long-term firm power contracts.

III. Performance Summary: PURCHASE POWER AND WHEELING (Cont'd)

FY 1997 Planned Accomplishments (Cont'd):

Non-firm purchases from northwest and instate suppliers will be balanced with purchases from PG&E energy bank account no. 2 (EA-2), to minimize costs and maximize rate stability through the year 2004, the life of the PG&E contract.

Alternative methods of financing are expected to provide $87,256,000, or about 58% of the CVP purchase power and wheeling program.

- Pick-Sloan Missouri Basin Program - The total program for the Pick-Sloan Missouri Basin Program, including Fryingpan-Arkansas Project, will continue to decrease slightly, based on forecasts of near-normal reservoir levels and average inflows.

Alternative methods of financing are expected to provide $32,225,000, or 77% of the Pick-Sloan Missouri Basin purchase power and wheeling program.

- Other Projects - Continue purchasing energy for the Parker-Davis and Boulder Canyon Projects.

Continue resource pooling arrangements with neighboring utilities to bank and exchange energy services to reduce the Parker-Davis purchase power and wheeling requirement by more than 60 percent.

Expect to complete advance funding arrangements with all remaining Boulder Canyon Project customers. The alternative financing arrangements will finance the total Boulder Canyon Project purchase power requirement, estimated at $3,000,000. This alternative method of financing will provide for 77% of the combined Parker-Davis and Boulder Canyon Project purchase power program.

Explanation of Funding Changes FY 1996 to FY 1997:

The current FY 1996 purchase power and wheeling program has declined from the enacted level by $11,822,000 due to improved water conditions throughout Western's service area and increased competitiveness in the energy markets.

The FY 1997 purchase power and wheeling appropriation requirement is expected to further decrease by $8,505,000 from the current FY 1996 program. A reduction of $5,958,000 in the Central Valley Project is expected from exercising the termination provisions of one or more of the long-term firm power contracts by the middle of 1997. Savings associated with termination will be partially offset by lower cost PG&E EA-2 and non-firm purchases. No costs have been assumed for potential litigation associated with the termination of one or more of the contracts. A reduction of $1,514,000 in the Pick-Sloan Missouri Basin project is due to slightly improved water conditions and slight expansion of alternative financing. A reduction of $1,033,000 for the Other Projects is due to anticipated advanced funding arrangements for Boulder Canyon Project power purchases and successful resource pooling arrangements at the Parker-Davis Project.

The above changes totalling a $20,327,000 reduction from the enacted FY 1996 appropriated program level, combined with unobligated FY 1995 balances of $2,778,000 and anticipated FY 1996 savings of $11,822,000, provide a net budget authority reduction of $34,927,000, or 37% in FY 1997.

WESTERN AREA POWER ADMINISTRATION

UTAH MITIGATION AND CONSERVATION

I. Mission Supporting Goals and Objectives

The Reclamation Projects Authorization and Adjustment Act of 1992, Title III--Fish, Wildlife, and Recreation Mitigation and Conservation provided for the establishment of the Utah Reclamation Mitigation and Conservation Commission (Commission). Under Title IV of this Act, the Utah Reclamation Mitigation and Conservation Account (Account) was established in the Treasury of the United States. The purpose of this account is to ensure that the level of environmental protection, mitigation, and enhancement achieved in connection with projects identified in the Act and elsewhere in the Colorado River Storage Project in the State of Utah is preserved and maintained. The State of Utah and the Administrator of Western Area Power Administration (Western) are authorized to deposit funds into the account. Such expenditures are to be considered nonreimbursable and nonreturnable.

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Utah Mitigation and Conservation	$ 5,135	$ 5,283	$ 5,432	$ +149	+ 3
Total, Utah Mitigation and Conservation	$ 5,135	$ 5,283	$ 5,432	$ +149	+ 3

1696

III. Performance Summary:

FY 1995 Accomplishments:

- Deposited $5,135,000 to the Utah Reclamation Mitigation and Conservation Account.

FY 1996 Accomplishments (to date and planned):

- Deposited $5,283,000 to the Utah Reclamation Mitigation and Conservation Account.

III. Performance Summary: UTAH MITIGATION AND CONSERVATION (Cont'd)

FY 1997 Planned Accomplishments:

- A deposit of $5,432,000 will be made to the Utah Reclamation Mitigation and Conservation Account.

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $149,000 represents a proportional increase in the deposit directed by the Reclamation Projects Authorization and Adjustment Act of 1992. Deposits are to increase annually based on the percentage of increase during the previous calendar year in the Consumer Price Index for urban consumers, published by the Department of Labor.

1999

WESTERN AREA POWER ADMINISTRATION

FALCON AND AMISTAD MAINTENANCE FUND

I. Mission Supporting Goals and Objectives

The Falcon and Amistad Operating and Maintenance Fund (Maintenance Fund) was established in the Treasury of the United States in FY 1995 as directed by the Foreign Relations Authorization Act, Fiscal Years 1994 and 1995. The Maintenance Fund is administered by the Administrator of the Western Area Power Administration (Western) for use by the Commissioner of the United States Section of the International Boundary and Water Commission (IBWC) to defray operation, maintenance (O&M) and emergency costs for the hydroelectric facilities at the Falcon and Amistad Dams.

All revenues collected in connection with the disposition of electric power generated at the Falcon and Amistad Dams, except monies received from the Government of Mexico, are credited to the Maintenance Fund and remain available until expended for defraying O&M and emergency costs for the hydroelectric facilities at the dams. Revenues, which are collected in excess of expenses, are used to repay, with interest, the cost of replacements and original investments. Prior to FY 1996, the funds required for the O&M activities of the Falcon and Amistad Dams were included in appropriation requests of the Department of State.

1700

II. Funding Schedule:

	FY 1995	FY 1996	FY 1997	$ Change	% Change
Falcon and Amistad Maintenance Fund	$ 0	$ 1,000	$ 970	$ -30	-3
Total, Falcon and Amistad Maintenance Fund	$ 0	$ 1,000	$ 970	$ -30	-3

III. Performance Summary:

FY 1995 Accomplishments:

- No activity.

III. Performance Summary: FALCON AND AMISTAD MAINTENANCE FUND (Cont'd)

FY 1996 Accomplishments (to date and planned):

- Twenty-four hour operation and maintenance of two powerplants with a combined generating capacity of 97.5 megawatts to ensure response to ever-changing water conditions, customer demand, and continual coordination with operating personnel of the Government of Mexico will be accomplished Work is performed by Federal employees who will continue to be allocated to IBWC by the Department of State.

- Power generated at the Falcon and Amistad Dams will continue to be marketed by Western. Power billing, collection, and repayment studies will be completed.

- An emergency reserve of approximately $200,000 provides funds for emergency situations. If no emergency occurs in FY 1996, the funds will carry forward and continue to provide an emergency reserve in subsequent years.

FY 1997 Planned Accomplishments:

- Day-to-day operation and maintenance of the hydroelectric facilities of the U.S. Section of the International Boundary and Water Commission (IBWC), located at Falcon and Amistad Dams (Texas), continues.

- Power will be marketed, repayment studies completed, and revenue collected.

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease of $30,000 reflects a correction to the O&M base calculation used by IBWC to separate hydroelectric costs from irrigation costs, offset by the elimination of request for emergency reserve funds.

PROGRAM DIRECTION

Mission Supporting Goals and Objectives

The Colorado River Basins Program is comprised of three power systems. These three systems are the Colorado River Storage Project, including the Dolores and Seedskadee Projects; the Fort Peck Project in Montana; and the Colorado River Basin Project in Arizona, including the Central Arizona Project and the United States' entitlement from the Navajo coal-fired powerplant near Page, Arizona. This program is funded in Western's business-type revolving fund (Federal Enterprise Fund), the Colorado River Basins Power Marketing Fund.

Revenues from the sale of electric energy and capacity replenish the fund and are available for expenditure for operation, maintenance, power billing and collection, program direction, purchase power and wheeling, interest, emergencies, and other power marketing expenses. Power sales and other revenues, which are collected in excess of expenses, are used for repayment of investments to the U.S. Treasury. This request is for spending authority only, and represents Western's estimate of obligations to finance these business-type operations.

The Program Direction activity provides compensation and all related expenses for the workforce that operates and maintains Western's high voltage interconnected transmission system and associated facilities. These employees include, but are not limited to, electrical and electronic engineers, high voltage linemen and electricians, power dispatchers, public utility specialists, environmental and safety specialists, and administrative staff.

Western operates and maintains the transmission system to ensure an adequate supply of reliable energy in a clean and environmentally-safe, cost-effective manner throughout the Projects funded in this Account. Western achieves continuity of service by maintaining its power system at or above industry standards, rapidly restoring service following any system disturbances, mitigating adverse environmental impacts, performing clean-up activities, and maximizing the revenues gained from non-firm energy sales. In concert with our customers, Western reviews required replacements to its existing infrastructure to sustain reliable power delivery to our customers and to contain annual maintenance expenses.

Program Direction has been grouped into four categories:

Salaries and Benefits: Funding for wages, including geographic differentials, pay raises (including legislated, negotiated, and administratively-determined), overtime, holiday and premium pay, and cash incentive awards for the Federal workforce funded in this Account. This category also includes Western's share of employee retirement, health and life insurance, accident compensation, Federal Insurance Contribution Act taxes, and Federal Retirement Thrift Savings Plan contributions. Benefits also include relocation expenses related to permanent changes of station, and payments for former employees such as severance pay and voluntary separation incentives.

Travel: Funding for the transportation of Government employees, their per diem allowances and incidental expenses incurred in the day-to-day performance of their responsibilities.

Support Services: Funding for services which include, but are not limited to, automated data processing and general administrative support.

Other Related Expenses: Funding for rental space, telecommunications, utilities and miscellaneous charges, printing and reproduction, training tuition fees, maintenance and repair of office equipment, supplies, materials, non-capitalized equipment, and the assessment of Department of Energy working capital fund expenses, and a distribution of Western's general management costs.

II Funding Schedule:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salaries and Benefits	$ 13,236	0	$ 14,420	$ 14,420	$ 14,682

Support Services	10,119	0	9,906	9,906	10,350
Other Related Expenses	1,893	0	1,736	1,736	2,632
Total, Program Direction	$ 26,241	0	$ 27,110	$ 27,110	$ 28,662
Full Time Equivalents					
Authorized	209		208	208	197
Usage	203		203	203	197
Average Per FTE					
Program Direction/Authorized	$125,555		$130,337	$130,337	$145,492
Program Direction/Usage	$129,266		$133,547	$133,547	$145,492

III Performance Summary:

FY 1995 Accomplishments:

- Maintained and operated approximately 4,000 miles of high-voltage transmission lines and associated substations, switchyards, communication, control, and general plant facilities associated with this program.
- Provided continuing services, such as power marketing, dispatching, power billing, revenue collection, and energy services activities.
- Obtained electrical resources and transmission capability to firm up the Federal hydropower supplies needed to meet Western's contractual obligations. Transmission wheeling services were also purchased when a third party's transmission lines were needed to deliver Federal power to Western's customers.

III. Performance Summary: COLORADO RIVER BASINS FUND (Cont'd)

FY 1996 Accomplishments (to date and planned):

- Continue regular activities, including operation, maintenance, dispatching, power billing and collection, power marketing, resource planning, energy services, technology transfers, environmental evaluations, safety, security and emergency management activities, as described in FY 1995 Accomplishments.

- Continued purchasing electrical resources and transmission capability to firm up the Federal hydropower supplies needed to meet Western's contractual obligations. Transmission wheeling services will also be purchased when needed

FY 1997 Planned Accomplishments:

- Regular activities, including operation, maintenance, dispatching, power billing and collection, power marketing, resource planning, energy services, technology transfers, environmental evaluations, safety, security and emergency management activities, as described in FY 1995 Accomplishments, continue.

- Electrical resources and transmission capability will be purchased to firm up the Federal hydropower supplies needed to meet Western's contractual obligations. Transmission wheeling services will also be purchased when a third party's transmission lines are needed to deliver Federal power to Western's customers.

1707

Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $1,552,000 in the Program Direction activity is attributed to increases in the numbers of permanent change of station allowances associated with Western's Transformation activities and voluntary separation incentives (buyouts).

Explanation of Average FTE Costs:

Program Direction is comprised mainly of engineers and highly-skilled craftsmen directly engaged in the operation, maintenance of the high-voltage, interconnected transmission system. The Colorado River Basins Fund receives a distribution of Western's general management costs, but the FTE remain associated with the Construction, Rehabilitation, Operation and Maintenance Account (CROM). The distribution of general management costs and a higher ratio of contract employees to Federal FTE result in a higher per FTE cost in this Fund than in Western's CROM. FY 1997 average cost per FTE is $145,492, or an increase of $11,945 per FTE above the FY 1996 level. The increase is primarily attributed to increased numbers of permanent change of station allowances and voluntary separation incentives (buyouts).

EQUIPMENT, CONTRACTS AND RELATED EXPENSES

I. Mission Supporting Goals and Objectives

The Colorado River Basins Program is comprised of power marketing, operation, and maintenance of transmission facilities of three power systems. These three systems are the Colorado River Storage Project, including the Dolores and Seedskadee Projects; the Fort Peck Project in Montana; and the Colorado River Basin Project in Arizona, including the Central Arizona Project and the United States' entitlement from the Navajo coal-fired powerplant near Page, Arizona. These activities are funded in Western's business-type revolving fund (Federal Enterprise Fund), the Colorado River Basins Power Marketing Fund.

Revenues from the sale of electric energy and capacity replenish the fund and are available for expenditure for operation, maintenance, power billing and collection, program direction, purchase power and wheeling, interest, emergencies, and other power marketing expenses.

Costs displayed in this section include materials and supplies, capitalized and non-capitalized equipment, technical support services used in direct support of the operation and maintenance of the interconnected power system, electrical resources, transmission capability, transmission wheeling, and interest payments to the U.S. Treasury. Beginning with this document, the personnel costs and personnel performance accomplishments are reflected in the Program Direction section of the Colorado River Basins Power Marketing Fund request.

1708

II. Funding Schedule:

Program Activity	FY 1995	FY 1996	FY 1997	$ Change	% Change
Equipment, Contracts and Related Expenses	$ 79,716	$102,304	$ 91,769	$-10,535	-10

III Performance Summary:

FY 1995 Accomplishments:

- Obtained electrical resources and transmission capability to firm up the Federal hydropower supplies needed to meet Western's contractual obligations. Transmission wheeling services were also purchased when a third party's transmission lines were needed to deliver Federal power to Western's customers.

III. Performance Summary: COLORADO RIVER BASINS FUND (Cont'd)

FY 1995 Accomplishments (Cont'd):

- Supplies and materials, such as wood poles, instrument transformers, meters and relays, were procured to provide necessary resources to respond to routine and emergency situations in Western's high-voltage, interconnected transmission system.
- Technical support services, such as waste management disposal, environmental impact analyses, and pest and weed control, were utilized.
- A transformer was replaced at Richland (Montana) Substation.
- Digital radio systems were installed at Malta and Fox Creek Substations (both in Montana).
- The foundation for the Dawson County (Montana) storage building and garage were replaced.
- A manlift truck and tilt deck trailer were replaced within the Colorado River Storage Project.
- A premanufactured building was purchased as a replacement for the Craig (Colorado) Substation building.
- Specialized test equipment, such as motion analyzers and multi-amp pulsar test sets, was procured.

FY 1996 Accomplishments (to date and planned):

- Continued purchasing electrical resources and transmission capability to firm up the Federal hydropower supplies needed to meet Western's contractual obligations. Transmission wheeling services will also be purchased when needed.
- A supply of switches, wood poles, crossarms, bushings, batteries and other miscellaneous materials will be maintained to enable Western to respond to routine and emergency conditions.
- Technical support services will continue to be utilized in areas such as waste management disposal, environmental impact analyses, and pest and weed control.
- A dump truck, gas cart, oil trailer, yard tractor and crane will be replaced.
- Improvements to access roads to Methodist Mountain and Fremont Mountain (both in Colorado) microwave sites will be made.
- Transformers will be replaced at three sites and circuit breakers will be replaced at two sites.

III. **Performance Summary: COLORADO RIVER BASINS FUND** (Cont'd)

FY 1997 Planned Accomplishments:

- Electrical resources and transmission capability will be purchased to firm up the Federal hydropower supplies needed to meet Western's contractual obligations. Transmission wheeling services will also be purchased when a third party's transmission lines are needed to deliver Federal power to Western's customers.
- Materials and supplies, including but not limited to, capacitors, guys, insulators, conductor, meters and relays, will be procured.
- Utilization of technical support services will continue.
- Transformers will be replaced at two sites; circuit breakers will be replaced at one site; and remote terminal units will be replaced at two locations.
- Beginning in FY 1997, Western is initiating a staged replacement of radios and associated equipment at substations, repeater sites, and mobile units to meet new Federal Communications Commission (FCC) and National Telecommunications and Information Administration (NTIA) regulations which require Western to move to narrow communications band spectrums by 2005.

Explanation of Funding Changes FY 1996 to FY 1997:

The decrease of $10,535,000 in Equipment, Contracts and Related Expenses is related primarily to lower interest estimates. The interest payment is lower in FY 1997 than FY 1996 because the FY 1996 payment included additional amounts to pay off historical underpayment.

TOTAL	$796,521	$804,825	$828,056	$843,009	$845,175	$845,007	$837,647

FOOTNOTES ON NEXT PAGE

1/ All project amounts are based on August 1995 Power Repayment Studies (PRS) or Rate Studies, except the following projects which are based on December 1994 PRSs; Falcon-Amistad, Loveland Area, Pick-Sloan Missouri Basin, Washoe, Colorado River Storage and Seedskadee. Colorado River Basin Project revenues are based on estimated projections; no PRS is prepared.

2/ FY 1996 is the start of interest and principal payments for the Hoover Dam visitor's center; however, revenues do not reflect the increase until FY 1997, as the first year is offset by a $13 million carryover balance from FY 1995. Revenues include water sales and visitor fees. Fluctuations in other years are due to changes in uprater credit payments.

3/ Power revenues have decreased since FY 1996 Congressional Budget because sales have gone down. This has occurred because Western customers have access through the California-Oregon Transmission Project and other means to suppliers other than Western. As a result, the purchases of power from Western by our customers has decreased, and there has been a corresponding decrease in purchase power costs, which has reduced our rates. Revenues decrease from FY 1995 to FY 1996 due to decrease in composite firm power rate and assumed return to average water following an above average water year in FY 1995. Revenues increase in FY 1997 and FY 1998 due to rate increases.

4/ Western has contractually agreed for the Salt River Project (SRP) to act as the scheduling entity and operating agent for the Central Arizona Project's (CAP) portion of the Navajo generating stations output (547 MW). In return, as Western retains repayment responsibility, SRP agreed to pay a monthly fixed and variable cost. This revenue is determined in order to meet CAP repayment requirements.

5/ In FY 2000, the decrease is due to reduced wheeling revenues in the Western Division of Pick Sloan.

6/ The increase in FY 1996 reflects additional revenue from the Mead-Phoenix and Mead-Adelanto Projects going in-service.

7/ FY 1996 is the beginning of a new "compound amortization of debt" methodology. A 5-year average revenue requirement is established and revenues collected in excess of annual requirement are carried forward to the following year and used to cover shortfalls in future years.

8/ FY 1995 revenues are less due to downstream flooding and decreased average rate for surplus sales. The fluctuations in revenue for FY 2000 and FY 2001 are related to the projection of Corps generation, which, by FY 2001, nets in reduced energy available for surplus sales from the mainstem system. These power revenues represent only the activities for the Eastern Division of the Pick-Sloan Missouri Basin Program. The Western Division revenues are included in the Loveland Area Projects.

9/ FY 1995 actual revenues are less than estimated due to less transmission revenues. Revenues increase through FY 1998 and decrease thereafter due to fluctuations in the sale of nonfirm energy based on hydrology projections.

10/ The Dolores Project a new participating project of the Colorado River Storage Project became operational in FY 1995.

11/ "Other" is identified separately for FY 1995 to correspond with Western's financial statement. It represents centralized functions that are distributed among the various projects in the out years.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
OFFICE OF INSPECTOR GENERAL
(Tabular dollars in thousands, Narrative in whole dollars)

PROGRAM MISSION

Major statutory responsibilities of the Office of Inspector General (OIG) as stated in section 4 of the Inspector General Act of 1978, as amended, 5 U.S.C. App.3, are to detect and prevent fraud, abuse and violations of law and to promote economy, efficiency and effectiveness in the programs and operations of the Department of Energy (DOE). In addition, Section 6006 of the Federal Acquisition Streamlining Act of 1994 requires the OIG to investigate certain reprisal complaints of contractor employees.

The GOAL of the OIG is to facilitate positive change in the Department by promoting the effective, efficient, and economical operation of its programs through audits, inspections, investigations, other reviews, and by inquiries into whistleblower complaints of reprisal by contractor employees.

The OBJECTIVES related to this goal are:

1. To provide independent, objective, high caliber, and timely audits, inspections, investigations and other reviews of the effectiveness, efficiency and economy of Departmental programs and operations.
2. To effectively select projects and functions in need of review by having a continual planning process.
3. To provide timely identification of wrongdoing in Departmental programs, operations, contracts, and grants.
4. To conduct activities which alert Departmental officials to fraud indicators.
5. To provide oversight of operations and field office implementation of the whistleblower protection program.
6. To successfully coordinate and perform joint efforts with the Department of Justice and other law enforcement agencies.
7. To perform all statutorily-mandated reviews.

1720

MISSION: OFFICE OF INSPECTOR GENERAL (Cont'd)

PERFORMANCE MEASURES:

Performance measures related to audit, inspection, and investigative activity are qualitative as well as quantitative. Quantitative performance measures used by the OIG include:

1. Number of audits completed.
2. Number of investigations closed.
3. Number of inspection matters closed.
4. Number of contractor reprisal inquiries closed.
5. OIG recommendations accepted or implemented by management.
6. Audit/inspection savings, recoveries and funds identified for better use.
7. Legislative and regulatory compliance related to OIG recommendations.
8. Positive changes in the Department after implementation of recommendations.
9. Complaints resolved.
10. Investigation recoveries/fines and funds identified for better use.

SIGNIFICANT ACCOMPLISHMENTS AND PROGRAM SHIFTS:

1. OIG actions in identifying attainable economies and efficiencies in Departmental operations have recently provided a positive dollar impact of approximately $3.4 million per audit employee per year.

1721

2. Implementation of the Government Management Reform Act of 1994 will require significant additional OIG resources. To meet these requirements the OIG has diverted existing resources from other important issues and vulnerable Department programs.

3. The OIG will have to assume additional responsibilities to address the increased vulnerabilities as Departmental downsizing and streamlining occur. Additional responsibilities may include a potentially significant increase in the number of Hotline complaints that the OIG must handle.

4. The Office of Contractor Employee Protection was transferred to the OIG in order to implement requirements of the Federal Acquisition Streamlining Act of 1994.

5. Due to several new statutory mandates and additional responsibilities having been placed upon the OIG over the past few years, the OIG's accomplishments will be less than complete over a broad range of its mandated mission, including: Requirements under the Chief Financial Officers Act of 1990 and the Government Management Reform Act of 1994 for audited financial statements; economy and efficiency reviews, internal control reviews, and programmatic reviews; responses to Hotline complaints; efforts to increase the focus of investigations to significant violations of Federal criminal and civil statutes, and to increase the number of cases accepted for prosecution; performance of management inspections and administrative allegation inspections which are highly focused, fact-finding reviews; responses to whistleblower reprisal allegations; reviews of existing and proposed legislation and regulations as required by the IG Act; and responses to Freedom of Information Act requests.

6. OIG investigative efforts have been redirected toward cases of increased complexity which result in more significant positive change for the Department. These cases include serious criminal violations, enforcement of civil fraud statutes, and significant administrative misconduct.

7. Resource constraints require higher thresholds for investigative case openings and inspection of administrative allegations, resulting in less coverage and less deterrent effect.

FY 1997 reflects transfer of the Office of Contractor Employee Protection to the OIG. FY 1997 and comparable data for FY 1995 and FY 1996 include Working Captial Fund.

OPERATING EXPENSES

I. Mission Supporting Goals and Objectives:

This activity conducts audits, inspections, investigations, and other reviews to fulfill the statutory duties and responsibilities of the OIG. Audits are conducted to provide independent evaluation of the Department's operating and administrative programs and include an assessment of the Department's financial and management control systems and procedures. Inspections are conducted to review administrative allegations received by the OIG, review management systems for economy and efficiency, and process referrals of allegations to Department management for appropriate action. Inquiries are conducted to resolve whistleblower complaints of reprisal by contractor employees. Investigations are conducted to determine prohibited or improper activities against DOE by its contractors, vendors, grantees, and employees.

Average	$ 101	$ 75		$ 85	$ 97

a/ Support Services costs of $1,750,000 for the total OIG for FY 1995 primarily reflect use of contract auditors and experts, and are shown for the field sites where technical monitors are located (Germantown, Oak Ridge, and Albuquerque).

b/ Virtually all of the FY 1996 funding of $26,915,000 is applied to salaries and benefits in this table, since it is estimated that these costs alone would total approximately $26,690,000 at the authorized staffing level.

c/ "Other Related Expenses" for Washington, D.C. and Germantown includes Working Capital funding, resulting in higher average FTE costs.

d/ FY 1996 and FY 1997 FTEs include Office of Contractor Employee Protection.

III. Performance Summary: Office of Inspector General

FY 1995 Measurable Performance Activities:

- Issued 177 audit reports with monetary benefits in excess of $654 million during FY 1995. Included were recommendations to reduce staffing at the Waste Isolation Pilot Plant by 25 percent and at the Strategic Petroleum Reserve by 20 percent, resulting in annual savings of $27.4 million.

- Identified excessive overtime payments to exempt employees at Savannah River. Payments totalled $34.1 million in FY 1993.

- Identified $46.3 million in precious metals which were or will be excess to Departmental needs

- Identified expenditures totaling about $3.8 million for design costs which could have been avoided had Operations Office obtained clarification from the U.S. Environmental Protection Agency (EPA) regarding requirements of the Comprehensive Environmental Response, Compensation, and Liability Act. Management agreed to require the environmental restoration project managers to more closely coordinate with EPA on future projects.

- Determined that due to the Department's failure to provide sufficient implementing guidance, it could not demonstrate that Cooperative Research and Development Agreements (CRADAs) met their goals, measured progress toward those goals, determined the viability of potential CRADAs or partner in-kind contributions, or ensured that consistent management guidance was provided to all Department facilities.

- Disclosed that the Office of Energy Research generally did not clearly specify performance expectations for research at the Department's national laboratories. Specifically, work authorizations for 237 of 264 tasks examined did not contain a clear statement of the work to be performed, resource limits, milestones, or specific deliverables

- Continued implementation of the Chief Financial Officers (CFO) Act of 1990, which requires the submission of financial statements to the Director of the Office of Management and Budget (OMB) for each Departmental revolving fund and trust fund, as well as activities which performed substantial commercial functions.

  - Eleven separate entities were initially involved in preparing financial statements which were audited under the management of the OIG.

  - The Government Management Reform Act (GMRA) of 1994 dramatically expanded the provisions of the CFO Act. The OIG is now required by law to audit financial statements covering all accounts and associated activities of the Department and to submit them to OMB annually.

  - The first set of audited financial statements for the Department is due no later than March 1, 1997. Accordingly, the OIG has necessarily begun to divert a material portion of its available staff to organize, plan and train for this effort. To date, for example, 120 auditors have received significant training and are performing financial statement audits. Field work on internal controls and compliance with laws and regulations commenced in June 1995. Substantive testing began in the fourth quarter of FY 1995.

1732

- Closed 234 investigations and referred 78 cases for prosecution (53 cases were accepted for prosecution) during FY 1995, and achieved $4,449,469 in fines, settlements, and recoveries during FY 1995.

- Realigned investigative efforts toward cases of increased complexity with emphasis on conducting investigations focused on significant violations of Federal criminal and civil statutes.

- Increased the number of cases accepted for prosecution from the previous four year average of approximately 44 percent of all cases presented to approximately 68 percent.

- Continued to respond to Hotline complaints and enhanced the efficiency of the Hotline operation . A total of 388 Hotline complaints were received during FY 1995.

- More evenly distributed the IG investigative presence in relation to where Departmental and contractor employees are located and costs are incurred.

- Established a new investigative management structure, thereby improving the efficiency of conducting investigations through the delegation of wider authority to the regional offices.

- Issued 40 inspection reports in FY 1995. Management implemented 103 recommendations to improve operations of the Department.

- Performed 65 management inspections and 158 administrative allegation inspections in FY 1995.

- Continued to manage the referral of selected Hotline allegations to DOE management or other agencies for appropriate action; referred 381 allegations in FY 1995, and requested a response on 205 of these allegations.

- Continued to coordinate the review, as required by the Inspector General Act, of existing and proposed legislation and regulations relating to the Department's programs and operations; coordinated the review of 34 legislative, regulatory, and procedural items in FY 1995.

- Continued to prepare the OIG quarterly report to the Intelligence Oversight Board as required by Executive Order 12863, "President's Foreign Intelligence Advisory Board."

- Continued to manage the OIG evaluation of qui-tam actions filed, pursuant to the provisions of the False Claims Act. Provided input to the Department of Justice on ten qui-tams reviewed in FY 1995.

- Closed 92 Freedom of Information Act cases during FY 1995.

FY 1996 Measurable Performance Activities:

- Continue implementation of the CFO Act and GMRA audit requirements. The major effort during FY 1996 will be the substantive testing of internal controls and for compliance with laws and regulations, and the substantive testing of year-end balances summarized in adjusted trial balances and in various financial statements. The OIG will "report" on the FY 1996 opening balances.

- Update the GMRA Strategic Plan beginning in March 1996; the training plan for FY 1996 will be drafted, finalized and training provided; field work will begin on internal controls and compliance with laws and regulations; and substantive testing will begin.

- Conduct audits evaluating various financial systems and procedures in use throughout the Department.

- Continue to conduct audits that examine the Department's procurement and contract administration activities.

- Continue to conduct audits of the Department's environment, safety and health programs to include audits on the cost effectiveness and planning activities of these critical programs.

- As resources permit, ensure that Department realignment actions are economical and efficient, including responding to management-requested reviews relating to streamlining organizational structure and flow.

- Review Department construction activities to ensure their need, and, where projects are cancelled, that funds are being properly reprogrammed.

Thus far in FY1996:

- Determined that the Department is not adequately monitoring and managing contractor overtime. A review of M&O contracts in effect at the end of FY 1994, and which incurred $251million in overtime costs during FY 1994, disclosed that contract terms were vague and efforts to manage overtime were limited.

- Disclosed that the Department spent $29 million on the production of 87 accident resistant containers that may never be used. DOE unilaterally decided to produce containers that the Air Force did not want and had no expressed desire for.

- Concluded that the Department does not have adequate control over arms and military-type equipment that it maintains for ensuring the security of the nation's nuclear weapons. The audit determined that the Department has more arms than are necessary to support its mission, and the inventory and disposal records associated with the arms are not always accurate.

- Determined that the Department is spending more on construction projects than is justified. Seven on-going construction projects totaling over $40 million at one Operations Office are either not needed or are larger than needed. At another location, one planned construction project has

1734

been approved even though the facility is not needed. Justification for the $8.4 million project was inadequate, and required evaluation of alternatives were either not performed or not documented.

- Actively promote a more effective, efficient and economical operation of Department programs by conducting more complex investigations of alleged waste, fraud and abuse with continuing focus on significant violations of Federal criminal and civil statutes. To date, this has resulted in a significant increase in the percentage of complex criminal and civil matters presented before the United States Attorney.

- Identify, through a coordinated effort with the United States Attorney's office, possible OIG investigative thresholds for blanket Department of Justice declinations on non-prosecutable cases which will result in an increased percentage of quality cases presented and accepted for prosecution. As a result, to date, monetary thresholds have been temporarily established resulting in a 17% reduction of the caseload.

- Improve the quality, effectiveness, efficiency, and timeliness of completing investigations through the implementation of an internal review team that will conduct site inspections of the investigative and support operations. As a result, the Internal Review Team inspection has established a schedule which will result in the review of all offices by December 1996. A 20% review, to date, has resulted in an improved quality of investigative management and operations.

- Restructure response to Hotline complaints, to increase use of DOE operations oversight, and investigate only those cases that meet an established threshold for potential prosecution. Implementation of the threshold requirements and increased oversight has resulted in at least a 15% reduction in cases referred for investigation.

- Increase the number of joint agency investigative task forces by 25 percent, which will result in the added benefit of using non-OIG investigative resources to augment current staffing levels, equipment and expertise in addressing DOE cases. To date, task force participation is more than halfway to this goal with cooperation from such agencies as the FBI, EPA and Justice Department.

- Improve communications with law enforcement personnel in other agencies, Department management and other OIG customers for the purpose of facilitating future cooperative efforts, and also for the purpose of developing leads, added information and improved knowledge. To date, efforts have resulted in a formal measurement of liaison activity with improved directions on establishing working relationships with local, state and Federal agencies.

- Continue to conduct administrative allegation inspections which are highly focused, fact-finding reviews that are typically in response to an allegation of waste or mismanagement. Also continue to review management systems issues that are identified during administrative allegation reviews. During FY 1996 to date, 109 allegation inspections have been worked on.

- Continue to manage the referral of Hotline allegations to DOE management or other agencies for appropriate action, and review the corrective actions taken by management. During FY 1996 to date, 137 referrals of Hotline allegations have been made to DOE management or other agencies.

- Continue to manage the OIG review, as required by the Inspector General Act, of existing and proposed legislation and regulations relating to the Department's programs and operations. During FY 1996 to date, managed the review of 10 existing or proposed laws or regulations.

- Continue the OIG quarterly reporting to the Intelligence Oversight Board, and conduct one oversight review of the Department's intelligence activities in accordance with Executive Order 12333, "United States Intelligence Activities," as required by Executive Order 12863, "President's Foreign Intelligence Advisory Board."

- Continue to manage the OIG evaluation of qui-tam actions filed, pursuant to the provisions of the False Claims Act, to provide input to the Department of Justice for determining appropriate action. Seven qui-tams still require OIG action.

- Successfully integrate contractor employee protection functions into the OIG consistent with the mandates of the Federal Acquisition Streamlining Act of 1994, as effected through transfer of the DOE Office of Contractor Employee Protection to the OIG. Integration of the Office of Contractor Employee Protection is an ongoing activity.

- Manage expected increase in whistleblower reprisal allegation cases resulting from continued contractor downsizing activities.

- Promote increased utilization of alternative dispute resolution techniques, including mediation, in whistleblower complaints and other cases as a more effective and efficient way to resolve disputes that do not otherwise require OIG intervention.

- Continue to process the increasing volume of Freedom of Information Act requests (to date in FY 1996 new cases have been opened at almost double the rate of FY 1995).

1736

FY 1997 Measurable Performance Activities:

Full completion of the following activities could be impacted by requirements to do additional work with fewer resources.

- Comply with the Chief Financial Officers Act of 1990 and the Government Management Reform Act of 1994 requirements for an audited Departmental financial statement. Compliance with these Acts will be a challenge with reduced resources.

- Should additional mandates be enacted, it is unlikely that resources would be available to meet the mandates.

- Perform audits of the Department's efforts at workforce restructuring and economic development.

- Continue audit efforts in the area of the Department's Environmental Management programs.

- Perform audits of the adequacy of the Department's efforts to implement performance-based contracting methods.

- Integrate the financial statement audit results into performance audits of the Department's primary functions and facilities.
- Continue reviewing areas that significantly impact the Department's streamlining objectives.
- Review areas highlighted as a result of financial statement audits.
- Review Department property maintenance practices to ensure that assets are being protected.
- Review the Department's mixed waste construction projects to ensure that funds are not expended where the technology is unproven.
- Ensure that the Department's leasing of facilities is justified and economical.
- Actively promote a more effective, efficient and economical operation of Department programs by conducting more complex investigations of alleged waste, fraud and abuse with continuing focus on significant violations of Federal criminal and civil statutes.
- Increase, through a coordinated effort with the United States Attorney's office, OIG investigative thresholds for blanket Department of Justice declinations on non-prosecutable cases which will result in an increased percentage of quality cases presented and accepted for prosecution.
- Restructure response to Hotline complaints, to increase use of DOE operations oversight, and investigate only those cases that meet the increased established threshold for potential prosecution.
- Continue to increase and explore opportunities for joint agency investigative task force operations, which will result in maximizing the personnel and fiscal resources, equipment, knowledge and expertise dedicated to each case, and which will also accelerate the timeliness of completing investigations.
- Increase direct communications with law enforcement personnel in other agencies, Department management and other OIG customers for the purpose of facilitating future cooperative efforts, and also for the purpose of developing additional leads, information and knowledge.
- Continue to improve the quality, effectiveness, efficiency, and timeliness of completing investigations through ongoing internal review team inspections.
- Continue to conduct administrative allegation inspections which are highly focused, fact-finding reviews that are limited to response of allegations of waste or mismanagement that have high visibility with DOE senior managers, members of Congress and the public. Also continue to review management systems issues that are identified during administrative allegation reviews.

1737

- Continue to manage the referral of Hotline allegations to DOE management or other agencies for appropriate action. Due to the decrease in inspections by the OIG, the number of referrals to management is expected to increase significantly. Also, the review of corrective actions taken by management would be reduced due to decreased staffing.

- Continue to manage the OIG review, to comply with the Inspector General Act, of existing and proposed legislation and regulations relating to the Department's programs and operations.

- Continue the OIG quarterly reporting to the Intelligence Oversight Board, and oversight of the Department's intelligence activities that are conducted in accordance with Executive Order 12333, "United States Intelligence Activities," as required by Executive Order 12863, "President's Foreign Intelligence Advisory Board."

- Continue to manage the OIG evaluation of qui-tam actions filed, pursuant to the provisions of the False Claims Act, to provide input to the Department of Justice.

- Continue to conduct inquiries to resolve allegations of whistleblower reprisals against contractor employees.

- Continue to provide oversight of operations and field office implementation of the whistleblower protection program.

- Continue to expect an increase in whistleblower reprisal allegation cases resulting from continued contractor downsizing activities.

- Continue to promote an increase in the utilization of alternative dispute resolution techniques.

- Continue to respond to Freedom of Information Act requests to the extent resources permit.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

The OIG's FY 1996 budget authority level of $25 million is not adequate to meet operating expenses for the year due to sharp budget reductions and additional costs. This level of funding is $6 million less than requested, and the situation has been further exacerbated by unfunded legislative mandates imposed on the OIG. Examples of these include transfer of the Office of Contractor Employee Protection (OCEP), with 14 FTEs, to the OIG with no additional funding, implementation in late FY 1995 of availability pay increasing investigator salaries by 25 percent, continuing costs associated with implementation of the Chief Financial Officers (CFO) Act and Government Management Reform Act (GMRA), and a potential requirement to audit the Working Capital Fund.

This situation requires the OIG to supplement its FY 1996 appropriation with unobligated balances carried over from the prior year. This results in actual operating costs significantly higher than the FY 1996 appropriation, and higher than the FY 1997 requested level. This situation, coupled with the nature of the OIG budget (which consists largely of nondiscretionary costs associated with a labor-intensive organization), results in the FY 1997 requested

funding level which will be a challenge for the OIG to perform the additional mandates of the GMRA with less resources. Under this Act, DOE is required to submit to OMB, and the Inspector General is required to audit, DOE financial statements covering all accounts and associated activities.

The FY 1997 request, and "comparable" data for FY 1995 and FY 1996, reflect the addition of the Working Capital Fund covering the OIG's Washington, D.C. and Germantown facilities. Such costs for OIG field sites will continue to be funded through the host Departmental facilities.

The OIG's field sites are located at or near major Department facilities offering the greatest potential to promote effective, efficient and economical operations through audits, inspections, investigations, and other reviews. The OIG continues to review its field structure to ensure its resources are used most efficiently, and recently closed its Dallas field office due to cancellation of the Superconducting Super Collider program.

V. Explanation of Average FTE Costs:

The average FTE costs depicted in Section II above indicate the extent to which the OIG's budget has declined, especially in relation to its authorized staffing levels. The FY 1995 average of $100,000 declines to $81,000 in FY 1996, due to budget reductions from an enacted level (comparable) of $33,996,000 in FY 1995 to $28,516,000 in FY 1996, and the authorized FTE level for FY 1996 (354) being higher than the actual FTE usage (339) used for the FY 1995 average (due to transfer of OCEP to OIG). Although the average of $92,000 requested for FY 1997 affords some relief, it is needed to help cover statutory mandates such as described above (OCEP, availability pay, CFO Act and GMRA, possible audit of Working Capital Fund, etc.).

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
DEPARTMENTAL ADMINISTRATION

PROPOSED APPROPRIATION LANGUAGE

For salaries and expenses of the Department of Energy necessary for Departmental Administration and other activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101, et seq.), including the hire of passenger motor vehicles and official reception and representation expenses (not to exceed $35,000), and the purchase of passenger motor vehicles (not to exceed12): [$366,697,000] $244,863,000, to remain available until expended, plus such additional amounts as necessary to cover increases in the estimated amount of cost of work for others notwithstanding the provisions of the Anti-Deficiency Act (31 U.S.C. 1511 et seq.): Provided, That such increases in cost of work are offset by revenue increases of the same or greater amount, to remain available until expended: Provided further, That moneys received by the Department for miscellaneous revenues estimated to total [$122,306,000] $125,388,000 in fiscal year [1996] 1997 may be retained and used for operating expenses within this account, and may remain available until expended, as authorized by section 201 of Public Law 95-238, [notwithstanding the provisions of section 3302 of title 31, United States Code] 31 U.S.C. 3302: Provided further, That the sum herein appropriated shall be reduced by the amount of miscellaneous revenues received during fiscal year [1996] 1997 so as to result in a final fiscal year [1996] 1997 appropriation from the General Fund estimated at not more than [$244,391,000] $119,475,000 (Energy and Water Development Appropriations Act, 1996)

1743

DEPARTMENT OF ENERGY
DEPARTMENTAL ADMINISTRATION APPROPRIATION
EXECUTIVE SUMMARY

Support To Departmental Mission

The Departmental Administration Appropriation (DA) funds salaries and expenses for the Office of the Secretary in addition to various staff and operating programs within the Department of Energy. Activities funded in this account support the Department's mission with internal customers (Direct Programs) as well as external customers including Congress, the Executive Office of the President, foreign dignitaries, and taxpayers.

DA organizations provide a range of products and services for external customers. These offices represent the Department by consolidating information from various sources and giving a Department-wide response to questions or issues. Professional services include: legal counsel, accounting, and financial services. These organizations perform a crucial central monitoring function for performance evaluation in support of the Secretary, ensure compliance with laws governing federal activity as well as specific programmatic activity, in addition to protecting against fraud, waste and abuse of federal funds.

Reinventing Government: This account is declining in size as a result of new technologies and redesign of the Department's mission in response to Congressional intent and National Performance Review suggestions. This managed downsizing will allow the Department to maintain strict controls, manage its workload, and prepare for the future. The enclosed budget proposes further structural reductions resulting from moving the four operations offices, Chicago, Idaho, Oak Ridge and Oakland together with the Office of Field Management to the Energy Supply, Research, and Development Appropriation. There is an additional proposal to transfer certain fixed headquarter expenses to a Working Capital Fund (more details on both items follow). On a comparable basis, accounting for both of these transfer, the account is in compliance with Executive Order 12837, for administrative savings. On a cumulative basis from FY 1993, this account has reduced administrative costs (including travel) in excess of 14%.

Field Operations: It is proposed that the four operations offices, Chicago, Idaho, Oak Ridge, and Oakland together with the Office of Field Management be funded separately from the Departmental Administration account. This proposal evolved as a result of a series of discussion which took place with the Office of Management and Budget, the primary elements at the affected field operations offices, and the appropriate Congressional staff. By creating a separate entity, Field Operations in Energy Supply, Research and Development, the Department is providing for a more focused resource management of the four multi-purpose field operations offices. This transfer moves these operations offices from an administrative account to a program account.

Working Capital Fund: During FY 1995 and FY 1996 funding in this account was significantly reduced to such an extent that management developed options to ensure adequate funding levels for critical operations and services to departmental programs. It was determined that the preferred method of financing such needed activities was by establishing a Working Capital Fund. The proposed Working Capital Fund will finance business-like activities traditionally funded in the Departmental Administration Appropriation. These activities in FY 1997 Working Capital Fund

include: rent, building operations, telephone services, postage, printing and graphics, supplies, copiers, contract closeout, and contract audits. These activities total approximately $93.3 million. The FY 1997 budget request is reduced for each dollar in the FY 1996 base for the working capital fund.

Activities in FY1997 will be financed by consuming organizations based on charges set using a variety of methods including: actual usage, space utilization, and percentage of employee population. The working capital fund contributions from the source appropriations are included in the respective program direction portion of their budgets. Actual amounts billed in the year of execution will be based on each organization's consumption of goods and services, that is, organizations will not be "taxed".

Program Overview:

DOE programs funded in this appropriation are: Office of the Secretary, Policy, Chief Financial Officer, Human Resources and Administration, Congressional, Public and Intergovernmental Affairs, General Counsel, Economic Impact and Diversity, and Board of Contract Appeals. Federal support functions include planning and national and international energy policy analysis, environmental policy, budget, accounting, legal, personnel, labor relations, staffing, organizational management, logistical services, printing, information management, contract management and reform, quality management, personal property management, scientific and technical training, congressional liaison, public and consumer outreach, economic impact and diversity, and contract dispute adjudication. Funding includes Departmental Administration employee travel and training, and contractual services such as support for DOE's overseas offices, budget and accounting systems, logistical services, automated data processing development and acquisition (non program specific), equipment maintenance, civil rights , each Departmental Administration sub-program's share of the working capital fund, and capital equipment. Also funds energy and environmental policy studies, public service announcements, newswire services, minority education/business/community support and assistance, and Department wide technical training development.

Cost of Work for Others

The budget provides for the cost of products and services provided by the field offices and national laboratories for non-DOE users. Work results from revenue programs related to the budgeted mission of DOE or is reimbursable work for state and local entities which are precluded by law from making advance payments. Costs are offset with revenues received from the sale of products or services.

Revenues

The revenues associated with the Cost of Work for Others program support the products and services described above. Miscellaneous revenues come from the sale of by-products that have no cost associated with the Departmental Administration appropriation, but offset the appropriation.

Budget Overview:

The total on-board head count projected for FY 1997 is 1,553 a 19 percent decrease from the FY 1995 baseline of 1,920.

The FY 1997 request provides $119.7 million for related salary and benefit expenses for 1,553 full-time equivalent employees. In this amount are $3.0 million of buy out costs for 65 employees to further streamline this account. The request also includes $ 2.7 million for travel funding continuing efficiencies required by the executive order. Funding for contractual support is $80.9 million. Cos t of Work for Others and Revenues are budgeted at $26.3 million and $125.4 million, respectively. The net appropriation request is $119.5 million compared to a comparable FY 1996 Enacted Appropriation of $86.7 million.

The following discussion compares major expense items on a comparable, total obligational authority basis, to show the relationship between FY 1996 operating level and FY 1997 requirements.

DEPARTMENTAL ADMINISTRATION
FY 1997 CONGRESSIONAL REQUEST

Obligational Authority ($ millions)	FY 1996 Comp	FY 1997 Cong Request	$ Change	% Change
Office of the Secretary	$ 3.4	$ 2.9	$ -0.5	-14.7%
General Mgt				
Personnel Comp & Benefits	115.0	119.7	4.7	4.1%
Other Expenses	79.6	83.6	4.0	5.0%
Program Support	10.9	12.4	1.5	13.8%
Cost of Work	22.8	26.3	3.5	15.4%
Revenues	-122.3	-125.4	-3.1	2.5%
Subtotal, Less Revenues	109.5	119.5	5.8	9.2%
Use of Prior Year Balances and Other Adjustments	-22.7	0	22.7	-100%
Dept Admin, Net Approp BA	86.7	119.5	23.2	37.8%

Summary of Changes:

Office of the Secretary - decreases by $0.5 million, resulting from reduced employment and related payroll costs.

Personnel Comp and Benefits - increase by $2.5 million, resulting from a $6.1 million decrease related to FTE reductions and $0.7 million decrease in buy out costs; offset by increases related to the pay raise of 4.2% ($4.5 million) and restoration of awards, overtime, and furlough funds ($7.0 million).

Other expenses - increase by $4.0 million, resulting from inflation of 3.2% ($2.4 million) and growth in the working capital fund expenses ($1.6 million).

Program Support - increases by $1.5 million, resulting from increases to Policy Studies.

Cost of Work for Others - increases by $3.5 million, resulting from increased federal requirements at Oakland.

Revenues Associated with Cost of Work for Others - increase $4.1 million consistent with increase above, offset by a $1.0 million decrease in miscellaneous receipts for added factor and depreciation.

Unobligated Balances - increase the requirement for new budget authority as a result of a one time reduction taken in FY 1996.

Other Adjustments - FY 1996 Comparable Budget Authority was reduced $4.6 million for unallocated residual associated with working capital fund activities.

Trends:

Some of the programs in this appropriation will continue to decline as a result of the Department's Strategic Alignment Initiative. Other offices could experience net growth for the same reason. For example, in an attempt to rationalize the Department's accounting functions, the Chief Financial Officer has consolidated all accounting functions from nineteen offices to three "Centers of Excellence". One of these centers is the Headquarters Accounting Office. As a result of this change, FTE requirements in the CFO's office will increase. Otherwise, we expect this account to decline as the Department's emphasis shifts to the main mission programs and decentralized field operations.

OFFICE OF THE SECRETARY

PROGRAM MISSION

The Office of the Secretary sets the direction and tone for the Department of Energy in establishing United States leadership in national security, environmental quality, energy resources, science and technology, and economic productivity with input from the Department's customers and stakeholders.

The GOALS of the Office of the Secretary is to:

Coordinate the efforts of the Department of Energy to reduce global nuclear danger; restore, stabilize, protect and enhance the environment; develop and deploy clean energy sources and enhance energy security; stimulate U.S. economic productivity; and leverage the Department's unique science and technology capabilities to provide knowledge that drives the nation's future.

The OBJECTIVES related to these goals are:

- Effectively support and maintain a safe, secure, reliable, and smaller stockpile without underground nuclear testing, safely dismantle and dispose of excess weapons, and provide technical leadership for national and global nonproliferation to reduce the continuing and new nuclear dangers in the world.

- Protect public health and the environment by understanding and reducing the environmental, safety, and health risks and threats from DOE facilities and develop the technologies and institutions required for solving domestic and global environmental problems.

- Develop and deploy energy efficient and renewable energy technologies; advance the efficient and environmentally responsible production, transportation and use of conventional energy sources; create sustainable energy technologies with high export potential; promote an equitable system of energy supply and end use for all consumers; and reduce the United States vulnerability to energy supply disruptions.

- Improve U.S. industrial competitiveness by promoting economic growth that stimulates the creation of high-wage jobs through research and development partnerships with industry, diversity in research and development collaborations, efficiency and pollution prevention, and global DOE technology usage and exports.

- Utilize the unique scientific and technological resources of our laboratories and universities to perform world class basic and applied research in commercial and national security arenas, that will advance U.S. security and economic productivity. The Department will continue to support a wide national science and technology portfolio.

1757

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
DEPARTMENTAL ADMINISTRATION
(Tabular dollars in thousands, Narrative dollars in whole dollars)

OFFICE OF THE SECRETARY

I. Mission Supporting Goals/Ongoing Responsibilities:

The Office of the Secretary sets the direction and tone for Department of Energy activities, which contribute to the welfare of the Nation by providing the technical information and the scientific and educational foundation for the technology, policy, and institutional leadership necessary to achieve efficiency in energy use, diversity in energy sources, a more productive and competitive economy, improved environmental quality, and a secure national defense.

Program Direction has been grouped into four categories:
Salary and Benefits provide funding for full-time permanent and other than full-time permanent employees, in the following classes: salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, other performance awards, and payments to funds for the benefit of employees.

Travel provides funding for the Secretary, Deputy Secretary, Under Secretary, special assistants, and security detail to travel both internationally and domestically in support of the Department's missions.

No Support Services.

Other Related Expense provides funding for employee training and development.

1758

II. Funding Table:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salary and Benefits	$ 3,049	$ 2,143	$ 0	$ 2,143	$ 2,537
Travel	360	307	0	307	307
Support Services	0	0	0	0	0
Other Related Expenses	7	50	0	50	6
Subtotal, Program Direction	$ 3,416	$ 2,500	$ 0	$ 2,500	$ 2,850
Prior Year Balances, Used	$ -852 1/			$ 852 2/	
Full Time Equivalents	27	24		24	24
Average Cost/FTE	$ 95	$ 104	$	$ 140	$ 119
Adjustment	$ 852			$ -852	
Budget Authority	$ 3,416	$ 2,500		$ 2,500	$ 2,850

1/ FY 1995 carry over balances.

2/ Carryover balances will be used in FY 1996 for the salary cost associated with the nomination to the position of Under Secretary, plus filling vacant staff positions within existing staffing allowances. The remaining carry over balance may be reprogrammed into the Departmental Administration Personnel Compensation and Benefits line item to help offset adverse actions to employees due to constrained FY 1996 Enacted funding.

III. Performance Summary:

FY 1995 Measurable Performance Activities:

- Committed to align, consolidate, and streamline organizations in the Department, eliminating 3,788 positions over the next five years. As of March, 2nd, 1996, reductions were ahead of schedule with on board staffing down by 920 positions since May through retirements and attrition.

- Committed to $14.1 billion in savings over the next five years through implementation of the recommendations from the Strategic Alignment, Galvin and Yergin Task Forces, and other cost savings initiatives, including privatization of four Power Marketing Administrations.

- Reduced Departmental directives by 50 percent and acquisition regulations by 25 percent, resulting in significant cost savings and avoidance.

- Improved the DOE average supervisor to employee ratio by 44%.

- Released more than 250,000 pages of records and helped thousands of citizens find information on their possible participation in human radiation experiments.

- Replaced bureaucratic internal and contractor oversight activities with effective self assessments, and completed self assessments in 95 percent of Headquarters and 83 percent of Field organizations establishing a baseline for improved quality processes.

- Received four Vice President Gore "Hammer Awards" for initiatives that will result in $3 billion in cost avoidance over the next five years primarily at a Power Marketing Administration.

FY 1996 and FY 1997 Measurable Performance Activities:

- Continue to reduce levels of management (improve supervisor to employee ratio and attain 1 to 15 by FY 1999).

- Increase employee responsibility by delegating more authority to the field, by sharing resources, and promoting "cross-servicing" arrangements..

- Continue efforts initiated in FY 1995 to lessen the burden of the Department's regulations.

- Achieve SAI savings in FY 1996 of $221 million by reducing staff by 10 percent and decreasing operational costs through office closings, consolidations, and organizational efficiencies.

- Achieve SAI savings in FY 1997 of $304 million by reducing staff by an additional 9 percent and decreasing operational costs through office closings, consolidations, and organizational efficiencies.

1760

III. Performance Summary: Office of the Secretary (Cont'd)

- o Continue to use workforce management tools such as buyouts, attrition, out placement, managed hiring, and involuntary separations to achieve a staffing target of 10,874 by October 1998. As of March 2nd,1996, actual employment was 12,698, which is down from a total of 13,618 on board in April 1995.

- o Continue to improve contract reform and performance measurements to increase accountability in all our activities.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $394K in Personnel Compensation and Benefits reflects the full effect of the FY 1996 pay raise, the partial year effect of the FY 1997 pay raise, and the use of prior year balances in FY 1996.

The decrease of $44K in Other Related Expense reflects a one time expense in FY 1996 involving public affairs services in support of public media affairs.

V. Explanation of Average FTE Costs:

The average FTE cost decrease of $21K/FTE reflects the one-time cost of supporting public affairs activity in FY 1996, the unobligated carryover in FY 1996; partially offset by the Personnel Compensation and Benefits increases discussed above. Note, FY 1996 average cost/FTE is distorted by the reflected unobligated balances.

1761

HUMAN RESOURCES AND ADMINISTRATION

PROGRAM MISSION

PROGRAM OVERVIEW

This budget submission covers the Office of Human Resources and Administration, the Office of Quality Management, and the Secretary of Energy Advisory Board. These three offices support the program missions of the Department of Energy in two broad ways: (a) by providing strategies, tools, and advice in a wide range of disciplines to help the entire Department to be more effective in managing its changing missions and (b) by supplying direct services that enable other offices, especially in (but not limited to) Headquarters components, to perform their functions in a quality and cost-effective manner. Taken together, these roles seek to leverage resources representing less than one percent of the DOE budget into improvements and services on behalf of the entire Department.

As change agents, these offices are responsible for much of the Department's agenda derived from the strategic alignment, quality management, contract reform, laboratory management, strategic energy research and development, downsizing, and reengineering initiatives as well as a host of activities in support of the National Performance Review. Disciplines as diverse as information management, telecommunications, contract administration, training, and personnel administration have been used over the FY 1995-96 period to guide and support such visible and significant changes as the following:

- One fourth of the Strategic Alignment Implementation projects are championed from these offices.
- DOE orders have been cut in half.
- A Laboratory Operations Board is reducing the management costs of the Department's laboratory system
- A Chief Information Officer organization has been established.
- The Department's Career Transition Handbook is a model for all Federal agencies.

- o Every program now has customer service plans, and the Department has published Customer Service Standards.

- o New Senior Executive Service standards now measure quality management behaviors and are being further changed to include "360 degree" performance feedback.

- o The Freedom of Information Act backlog is being eliminated.

During this same period, as direct service providers, these organizations have been setting an example for downsizing, streamlining, and reengineering. Human Resources and Administration, for example, has reduced staffing from FY 1994 to the present at four times the staffing reduction rate of the rest of the Department, from over 1000 to under 800. The number of buildings occupied in Headquarters has declined from 16 to 13 in recent months, on a path to achieve occupancy of only 4 buildings over the longer term. The number of HR&A supervisory positions has decreased by more than half over 2 years, and the amount of photocopies generated in Headquarters declined by a quarter in a single year. HR&A overtime costs in FY 1996 have decreased 64% since FY 1994. These are but a few of the many examples of significant cost reductions occuring within these organizations.

As discussed in more detail below, the offices plan to build on the progress of FY 1995-96 in the coming year with further support for strategic alignment, contract reform, customer service, quality management, the ongoing openness initiative, and the National Performance Review.

1763

The major shift in budget resources from FY 1996 to FY 1997 involves the creation of a Working Capital Fund to finance common administrative costs (for example, rent, building services, and supplies). Authorized by the Department of Energy Organization Act, and pursuant to congressional direction in the FY 1996 budget process, the Fund permits clear allocation of administrative costs to mission programs. It promotes efficiency by ensuring the program offices are cognizant of administrative costs, and provides a flexible framework for managing administrative operations in a business-like manner.

Statements of Strategic Purpose

Office of Human Resources and Administration Strategic Goals

- To provide strategies and tools in support of DOE mission priorities; to align, rightsize, diversity, and develop human resources; and to create more business-like corporate management practices.
- To implement cost reduction within the Department and be the provider of choice for best-value products and services through the Working Capital Fund.
- To maintain quality management on all levels of the organization with continuing improvement in communication, customer satisfaction, employee participation and development, effective partnerships, and processes, with emphasis on results.

Quality Management Mission

The Office of Quality Management serves as the corporate-level catalyst for accelerating the transformation of the Department of Energy to a customer-centered, quality culture. The Office provides the corporate quality framework, expertise, training, and information processes in partnership with customers and stakeholders.

Secretary of Energy Advisory Board

The Board provides expert guidance to the Secretary on matters concerning the Department's management reforms; research, development, and technology activities; and the Department's energy, environmental and national security responsibilities.

1764

PERFORMANCE MEASURES

HR has prepared crosscutting performance measures for the entire organization as well as specific service commitments for each of the individual administrative disciplines. The following are examples from the most recent strategic planning:

- o Crosscutting
  - Customer service satisfaction as measured by survey and by benchmarking with other agencies;
  - Reduced cost, expressed in dollars, staffing, overtime, space, and other inputs;
  - Reduced cycle time.
- o Information Management - One-third reduction in hardware installation time and further10% reduction in printed output. Consolidation of 75 software contracts into 3 enterprise-wide contracts with annual savings of $2 million.
- o Procurement - 50% reduction in procurement regulations and 40% reduction in procurement request processing time. Triple use of Purchase Cards.
- o Human Resources - 50% increase in Department-wide participation in career mobility programs; 10% annual increase in Career Centers; 50% reduction in personnel actions requiring Headquarters review; 80% completion rate of assigned requirements for Technical Leadership Development Program.
- o Management Practices - 66% reduction from FY 1995 level of Field directives; 10% cycle time reduction for Work-for-Others agreements; 20% reduction in facility energy consumption; a further decrease in paper copy use of 20%; 80% of first tier organizations using automated document control system.

1765

HUMAN RESOURCES AND ADMINISTRATION

I. Mission Supporting Goals/Ongoing Responsibilities:

Human Resources and Administration (HR) is responsible for personnel, training and development, information management, procurement, organization and management, the executive secretariat, and administrative services. Human Resources and Administration works in partnership with its customers to support the mission of the Department of Energy and enhance the effectiveness and well-being of its people. The Office of Quality Management provides the corporate quality framework, expertise, training, and information processes for the Department in partnership with customers and stakeholders. The Secretary of Energy Advisory Board provides expert guidance to the Secretary as requested on a broad range of Department of Energy topics.

Program Direction has been grouped into four categories:

Salary and Benefits provide for funding for full-time permanent and other than full-time permanent employees, in the following classes: salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, Senior Executive Service and other performance awards, payments to funds for the benefit of employees, workman's compensation, and buy out compensation.

Travel funds finance staff travel, DOE advisory board activities, quality management field interface, travel associated with scheduling and logistics for Secretarial trips, and travel associated with permanent change of station. Also includes DOE shuttle bus service, rental of vehicles from the GSA motor pool, lease of DOE fleet, and charter of aircraft or buses.

Support Services finance technical support services and management support services.

Other related expenses finance the acquisition of goods and services that support this office's mission that are not considered support services, in addition to items purchased from the working capital fund, for example, rent, supplies, telephone service, etc.

Program Support includes funding for the Scientific and Technical Training Program for DOE-wide technical curriculum development, training standards and guidelines, and advanced learning technologies, such as, automated course catalogues, video and computer training. Includes funding for the Energy Technical Training Center.

1766

II. Funding Table:

($ thousands)	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request

Adjustment	-519			-3,491	
Budget Authority	$ 129,984	$165,411		$ 113,546	$ 120,538

III. Performance Summary:

FY 1995 Measurable Performance Activities:

- o DOE orders have been reduced by 50% since October, 1993, one year ahead of schedule. These actions eliminated non-value added requirements, reduced paperwork, improved operations, and decreased expenditures.

- o As a result of the Strategic Alignment Initiative, the Department developed a plan to reduce staff by 3,800 FTEs by FY 2000 with an associated savings of $800M. The plan also reduces overhead costs, consolidates organizations, and initiates a range

of continuous improvement actions. The Departmental Streamlining Plan was completed and submitted to OMB and the National Performance Review.

- Implement more flexible performance management system for Senior Executive Service which measures achievement of strategic corporate goals and objectives as well as core competencies in areas such as leadership, customer service, re-engineering of work processes efforts, quality advocacy, building of teams and development of employees. The system includes feedback from multiple sources, such as customers and stakeholders and development of team goals and awards.

- Secretary of Energy Advisory Board Task Force on Alternative Futures of the Department of Energy National Laboratories provided recommendations regarding management and mission at the Department's ten multi-program laboratories. The Department will implement 25 of the 29 recommendations.

- The Department established a Laboratory Operations Board to review and provide advice on efforts to reduce the direct and indirect costs associated with management and supervision of the Department's laboratory system.

- Secretary of Energy Advisory Board Task Force on Strategic Energy Research and Development released its final report entitled: Energy R&D: Shaping Our Nation's Future in a Competitive World. The report concluded that federal support for energy R&D is "essential to our Nation's future well-being," contributing to economic growth, security, environmental quality and competitiveness in the international marketplace.

- Significant progress was made in the effort to establish interoperable electronic mail and file transfer capabilities throughout the Department and with other Government agencies, the science and education sector, and the public.

- Secure Information Management and Exchange System (SIMEX) replaced the Department's Secure Automatic Communications Network and the Wideband Communications Network. SIMEX is resulting in cost-savings of more than $500,000 per year and is providing users with significantly increased capabilities. SIMEX is the first civilian agency sponsored system to receive the certification of the Defense Information System Agency.

- Installed new Freedom of Information Act tracking system, reducing backlog by 78%.

- The Training and Human Resource Development Program completed the Technical Personnel Qualification Standards and the Strategic Alignment Implementation Plan while continuing to complete professional competency and training

III. Performance Summary: Human Resources and Administration (cont).

development, career transition programs and workshops, and learning systems delivery components to enhance leadership and managerial and employee capacities in procurement, project management, and cost control and analysis.

- Completed DOE internal Organizational Self-assessments establishing a baseline for improved quality processes and measured baseline external customer satisfaction.

- Revised Department of Energy Customer Service Standards published in the Vice President's 1995 Customer Service Report "Putting Customers First '95: Standards for Serving the American People."

FY 1996 Measurable Performance Activities:

- Implement plan to streamline the Department by use of buyouts and early retirements, delayering efforts, retraining staff to work in teams with an emphasis on efficiency and improved customer service, and the development of partnerships with labor organizations and customer groups. Develop and provide services to assist employees in career transition including employment related seminars and workshops, career counseling, and use of the Career Management Resource Center.

- Developed a Career Transition Handbook adopted by OPM as a model for all Federal Agencies.

- Implement new performance appraisal system for managers and supervisors other than Senior Executive Service employees modeled on the Senior Executive Service system.

- Achieve an 80% reduction in supplemental field directives; Accomplish an additional 10% reduction in DOE internal regulations above the 50% achieved in FY 95.

- Develop a space management plan which will consolidate Headquarters personnel into four core locations from existing 16 locations to save $18M over next five years.

- Implement a Working Capital Fund for improving resource management and provide clear allocations of administrative costs to mission programs.

- Re-engineer the information management business processes yielding both customer service improvements and approximately $35M in savings over the next five years.

III. Performance Summary: Human Resources and Administration (cont.)

- Leverage the Departmental information management resources to ensure cost savings and improved efficiencies in programmatic and administrative business processes. Consolidate information technology acquisitions and service centers resulting in approximate savings of $100M over the next five years.

- Establish a corporate approach to managing Departmental information which is integrated and coordinated across the Department resulting in savings of $40M over the next five years. Develop an integrated information infrastructure.

- Develop and deliver an integrated and systematic quality training curriculum, resulting in increased customer satisfaction, behavioral change toward core values, and positive participant feedback.

- Communicate best practices throughout the Department which have resulted in cycle time reduction, elimination of waste, improved customer satisfaction, and cost savings and the avoidance of duplication (for example, electronic sharing of information, videos, and written communication).

- The Training and Human Resources Development Program to institute a corporate framework for development and use of managerial, technical, professional, and business practices competencies and learning materials through leadership centers coordinating classroom delivery, team and self-development workshops and consultation, and distance learning technologies.

- Eliminate Freedom of Information Act backlog of requests from prior to 1995 and implement a pilot centralization program. Revise the Departments Freedom of Information Act regulations.

- Establish a SEAB subcommittee to review declassification and other openness issues, with the goal of expanding and institutionalizing the Department's openness initiative.

- Build increased in-house capabilities for training and facilitating, resulting in dramatic reduction of reliance on contractor support services.

- Elimination of waste and redundancy through use and application of information from best practices network.

FY 1997 Measurable Performance Activities:

1770

III. Performance Summary: Human Resources and Administration (cont.)

- Continue to re-engineer the information management business processes yielding both customer service improvements and savings over the next four years.

- Continue the leverage of Departmental information management resources to ensure cost savings and improved efficiencies in programmatic and administrative business processes. Continue to consolidate information technology acquisitions and service centers resulting in savings over the next four years.

- Continue a corporate approach to managing Departmental information which is integrated and coordinated across the Department resulting in savings over the next four years. Implement an integrated information infrastructure.

- Continue declassification review and other openness initiatives.

- Continue to build the Department's in-house capability to implement quality management initiatives.

- Improve management practices in order to expand DOE employee capability for customer satisfaction.

- Expand use of performance measurement to improve Departmental operations using the Presidential Award for Quality criteria.

- Support strategic alignment implementation process by focusing action on core business and support processes.

- Implement the space management plan which will consolidate Headquarters personnel into nine locations by the end of FY 1997.

- Continue the use of training and development tools to direct available work force and learning resources toward changing mission priorities and management improvement goals.

- Implement Electronic Commerce system Department-wide for small purchases.

- Implement Contract Reform procedures and streamline procurement process to permit right-sizing of the Procurement organization.

- Incorporate excellence incentives into new contract awards to obtain best possible performance from contractors

1771

III. **Performance Summary: Human Resources and Administration (cont.)**

- Continue streamlining the Department using buyouts and early retirements, delayering efforts, retraining staff to work in teams with an emphasis on efficiency and improving customer service, and developing partnerships with labor organizations and customer groups. Develop and provide services to assist employees in career transition including employment related seminars and workshops, career counseling, and use of the Career Management Resource Center.

- Streamline personnel systems to reduce administrative processing time frames, provide improved customer service, and increase the use of automation. Revise employee pay and classification systems to improve the Department's performance in rewarding, retraining, and recruiting technical excellence in the workplace.

- Implement centralized Freedom of Information Act program and eliminate any backlog of 1995 requests.

- Continue use of Quality Self-Assessment to measure progress and target areas for continuous improvement.

- Develop corporate-wide mentoring program among program offices and corporate-level strategic alignment teams.

IV. **Explanation of Funding Changes FY CY to FY BY:**

On a comparable basis, using Budget Authority only, the funding for this account increases by $7.0M. Of this amount $ 2.0M can be explained by increases to personnel compensation and benefits. FTE reductions savings (-$4.1M)and fewer buyouts (-$0.5M); offset by furlough reductions ($1.3M), payraise ($2.5M), and restoration of awards and overtime ($2.8M). Contractual services increase by $5.0M; $1.8M in inflation, $2.3M funded in FY 1996 with unobligated balances and $0.9M to support payroll outsourcing (additional requirements).

On a comparable basis, using total obligation authority, the funding for this account increases by $3.5M. Personnel Comp and Benefits are offset with$1.2M of prior year balances and Contractual Services are offset by $2.3M..

V. **Explanation of Average FTE Costs:**

Average FTE costs increase by $16.4K/FTE. $9.0K/FTE is related to the $7.0M funding increases discussed above. The $7.4K/FTE difference relates to fixed portions of this office's contractual expenses that support mainline programs, for example the corporate mainframe computer and the shuttle bus service. These expenses will not decline consistent with the FTE reductions in this office.

1772

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
DEPARTMENTAL ADMINISTRATION APPROPRIATION
(Tabular dollars in thousands, Narrative in whole dollars)

OFFICE OF CHIEF FINANCIAL OFFICER

I. Mission Supporting Goals/Ongoing Responsibilities:
The Office of Chief Financial Officer (CFO) provides centralized direction and oversight on the full range of financial matters: responsibility for the Department's budget including formulation, presentation and execution; Department-wide compliance with the requirements of the Federal Managers' Financial Integrity Act (FMFIA); Departmental accounting and financial policies, procedures and directives; operation and maintenance of the Department's payroll system and financial information system/Standard General Ledger; performance of financial management functions (accounting, cash management, and reporting). In addition to these department-wide responsibilities for Headquarters offices, the CFO performs selected financial management functions for field locations; oversight of financial operations for the Naval Petroleum Reserves in California and Wyoming; and responsibility for overall quality budget formulation, execution, and financial compliance activities within the Department, including continued improvement of coordination and communications between Departmental headquarters and field organizations.

Overall, the CFO's budget increases slightly while FTEs will decrease by 4%. This is due to the Strategic Alignment Initiatives to streamline processes and increase our efficiency. One Strategic Alignment Initiative calls for consolidating 19 accounting centers into three by the end of FY 1997. The Office of Headquarters Accounting Operations will become one of three Departmental Centers of Excellence. The Headquarters center will consolidate six accounting organizations into one center, making it the largest volume accounting center in the Department. The consolidation of accounting organizations will save the Department $17.7 million and 61.5 FTEs over a five year period, but will minimally increase the headquarters budget. A second Strategic Alignment Initiative calls for outsourcing the payroll function during calendar year 1998. This will result in a cost avoidance between $7.2 million and $15 million in systems enhancement costs: however, we will need to invest $375,000 in FY 1997 to reap these savings.

The Department of Energy is a leader in the field of financial management and is ranked among the best in government and industry and is committed to enhancing its quality. This leadership is expressed in five major thrusts: Financial Stewardship, Full Partnership, Customer Orientation, Human Resource Management, and Technology/Information Architecture. CFO supports the Department's strategic goals as promulgated in the Department's Mission Statement and Strategic Plan. The Core Values of the Department are detailed in our goals and objectives. Sound financial management is essential to accomplishing the Department's goals, especially during a transition to emphasize core business strategies.

Program Direction has been grouped into four categories:

Salary and Benefits provide for funding for full-time permanent and other than full-time permanent employees, in the following classes: salaries and wages,

1773

overtime pay, cash incentive awards, lump sum leave payments, Senior Executive Service and other performance awards, payments to funds for the benefit of employees, workman's compensation, and buy out compensation.

Travel funds finance staff travel for Department-wide and CFO activities including travel associated with the Departments' initiatives for accounting consolidation and payroll outsourcing.

Support Services finance technical support services and management support services.

Other Related expenses finance the acquisition of goods and services that support this office's mission that are not considered support services, for example items purchased from the working capital fund, for example, rent, supplies, telephone service.

II. Funding Schedule:

Headquarters	FY 1995 Comparable Appropriation ($000)	FY 1996 Original Appropriation ($000)	Real & Comp Adjustments ($000)	FY 1996 Comparable Appropriation ($000)	FY 1997 Budget Request ($000)
Salary and Benefits	$16,652	$16,408	$33	$16,441	$17,491
Travel	231	187	0	187	187
Support Services	5,011	4,073	0	4,073	4,073
Other Related Expenses	3,944	1,089	2,402	3,491	4,386
Subtotal	25,838	21,757	2,435	24,192	26,137
Adjustment	0	(196)	0	(196)	0
Total Budget Authority	**25,838**	**21,561**	**2,435**	**23,996**	**26,137**
Prior Year Balances	135	1,109	0	1,109	0
Total Obligational Authority	**25,973**	**22,670**	**2,435**	**25,105**	**26,137**
Full Time Equivalents	278	260		260	250
Average FTE Cost	$93	$87		$97	$105

FY 1997 Funding Summary

The Office of the Chief Financial Officer's FY 1997 budget request is $26,137,000, an increase of $2,141,000 over the FY 1996 requirement of $23,996,000. (The FY 1996 requirement has been supplemented by $1,109k of unobligated balances.) The FY 1997 request provides funding for 250 Full-time equivalent (FTE) positions, a decrease of 10 FTEs or -4% from the FY 1996 level of 260 FTEs. The FY 1997 FTEs reflects a 10 % reduction over two years while accommodating

a major increase in the workload by becoming one of three centers of excellence processing centers. Were it not for the growth necessary to staff the processing center of excellence, the CFO staffing level would be down by over 17%.

III. Performance Summary:

FY 1995/1996 Measurable Activities:

Obtained an unqualified opinion on all the Department's ten financial statements required under the CFO Act of 1990. These statements cover one quarter of the Department's total budget authority, and include power marketing, nuclear material waste management, decontamination and decommissioning, isotope production, oil sale and reserve activities, as well as the Federal Energy Regulatory Commission.

Coordinated and ensured the quality of the Department's management control program and prepared the Secretary's annual Federal Managers' Financial Integrity Act (FMFIA) Report to the President and Congress.

Consolidated five budget execution directives into a single order as part of the Secretarial initiative to reduce and streamline Departmental Directives.

Worked with Congressional staff and significantly improved the quality and shortened the length of the Congressional Budget.

Conducted Department-wide campaign to promote direct deposit of salary and travel payments, which resulted in raising the salary participation rate to 93% and increased travel participation by 20% from 15% to 35%.

Enhanced Budget execution process to distribute funds to include reimbursable work, eliminating requirements to issue separate allotments for direct funding and reimbursable funding.

Successfully completed planning and implementation of many process improvements, automated and otherwise, to travel systems to facilitate ease of use and control of funds while reducing human resource requirements significantly.

Developed a "Status of Appropriations" monthly report in response to a request from the House Energy and Water Appropriation Subcommittee to aid in tracking budget execution of DOE appropriations.

Completed and issued the "DOE U.S. Government Standard General Ledger Accounting Guide" and electronically transmitted a Standard General Ledger trial balance to Treasury's Federal Agency Centralized Trial Balance System representing all of the Department's non-power marketing financial activity in FY 1995. The Department completed all system development efforts, including documentation, in accordance with Treasury's current requirements.

Maintained a 95% prompt payment percentage for FY 1995, matching the targeted goal for the Department.

Developed new policy for the Voucher Accounting for Net Expenditures Accrued (VANEA) process for cost certifications of the management and operating

1775

contractors.

FY 1997 Measurable Performance Activities:
Coordinate and ensure the quality of the Department's management control program and prepare the Secretary's Annual FMFIA Report to the President and Congress.

Complete third and final phase of Management Analysis Reporting System (MARS) implementation.

Submit Department-wide audited FY 1996 financial statements to the Office of Management and Budget.

Electronically transmit a Standard General Ledger trial balance to Treasury's Federal Agency Centralized Trial Balance System representing all of the Department's non-power marketing financial activity in FY 1997.

Reduce the volume and increase the usefulness of the OMB and Congressional Budget.

Streamline the field budget process to save both contractor and Federal staff devoted to the process while providing needed information to Headquarters in a timely fashion.

Maintain a 95% prompt payment percentage for FY 1997, matching the targeted goal for the Department.

Complete consolidation of accounting functions from three field accounting centers at the Headquarters accounting center.

Obtain contractual support services for the CFO Annual Report; DOE Accounting Practices and Procedures; and other analyses and reports.

Use contractual services and capital equipment funds to support automation requirements including systems development and maintenance. The systems are essential for financial controls, accounting, and report to external parties including OMB and Congress.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

●**Personnel compensation and benefits** reflect an increase of $1,050,000 in new Budget Authority but only a $750,000 increase with the use of prior year balances ($300k) in FY 1996. The increase reflects funding for a 4.2% payraise ($.7M), restoration of awards and overtime ($.4M), and not implementing furlough days in FY 1997 ($.4M) This increase is offset by a -$.7M FTE savings. The decrease in FTEs is due to streamlining processes based on a Strategic Alignment Initiative.

●**Travel** funding remains constant with FY 1996 at $187,000. Travel associated with the Department-wide activities are reduced commensurate with the reduced FTEs; however, there are increased requirements necessary for activities associated with the Departmental initiatives for accounting consolidation and payroll outsourcing. The increase has been offset by a decrease in travel costs associated with compliance reviews. The CFO has reduced the number of periodic reviews

at field organizations as a result of improved performance resulting from closer oversight of financial operations by field managers and focusing on performance indicators rather than field visits.

Contractual Services:

Contractual Services include Support Services and Other Related Expenses. In contractual services, the increase is limited to Other Related Expenses only. Other Related Expenses in FY 1997 are $4,386,000, an increase of $ $895,000 over the FY 1996 funding level of $3,491,000. This increase is only $252,000 greater than FY 1996 level when FY 1996 is adjusted for the use of prior year balances. In addition, ADP funding which is located in both categories, is discussed separately below.

- Support Services funding reflects management and technical support activities. The funding for these activities is $4,073k in FY 1997 which is unchanged from the FY 1996 funding level. (See Table Below)

CFO Support Services	FY 1995 ($000)	FY 1996 ($000)	FY 1997 ($000)	FY 1997/FY 1996 Change ($000)
Financial Management Development Training	$25	$43	$43	$0
Budget Support Services and Compliance support for systems review	465	664	664	0
Management Control Training	43	24	24	0
Payroll Support	0	28	28	0
Support on the updating and reviewing of the Accounting Handbook	20	20	20	0
Subtotal	**553**	**779**	**779**	**0**
ADP Support:				
Support for Department-wide finance accounting and budgeting systems including development enhancement	4,249	3,208	3,208	0
Support for source data collection data entry, data validation and report generation	209	86	86	0
Subtotal ADP Support	**4,458**	**3,294**	**3,294**	**0**
Total CFO Support Services	**5,011**	**4,073**	**4,073**	**0**

1777

• **Other Related Expenses** includes funding for Training, Working Capital Fund, Payroll Initiatives, and Capital Equipment. (See Table Below)

Other Related Expenses	FY 1995 ($000)	FY 1996 ($000)	FY 1997 ($000)	FY 1997/FY 1996 Change ($000)
Training	$84	$63	$89	$26
Working Capital Fund	2,371	2,402	2,558	156
Payroll Initiatives	0	221	375	154
Subtotal	**2,455**	**2,686**	**3,022**	**336**
ADP Support:				
Software Procurement /Maintenance Activities/Capital Acquisitions	1,200	1,225	1,224	(1)
Subtotal ADP Support	**1,200**	**1,225**	**1,224**	**(1)**
Other	289	160	140	(20)
Total Obligational Authority	**3,944**	**4,071**	**4,386**	**315**
Use of Prior-Year Balances	0	580	0	(580)
Total Budget Authority	**3,944**	**3,491**	**4,386**	**895**

Training funding is $89,000 versus $63,000 in FY 1996. The increases for training are related to the payroll personnel whose jobs will be eliminated or significantly re-engineered when the payroll function is outsourced to another agency in 1998. The training funds are targeted for worker retraining to assist payroll technicians in qualifying for other jobs internal and external to the CFO's office.

Working Capital Fund is $2,558, 000, a modest increase of $156,000 over FY 1996 ($2,402k). The increase is related to inflation of 3.2%.

Payroll initiatives increase due to a one time funding requirement that would maintain basic payroll functions during the outsourcing of the payroll system to another agency.

Other includes funding for additional support necessary to consolidate six accounting centers into the Headquarters accounting center, implementation of performance measures for financial operations and other Departmental Activities required by the Chief Financial Officers Act of 1990 and the

Government Performance and Results Act, and reimbursement of costs associated with the Department of Health and Human Services (HHS) grants payment system, which began in FY 1996 and must be fully implemented by FY 1997.

♦**ADP support** does not increase from FY 1996 to FY 1997. Several initiatives associated with the Management Analysis Reporting System were initiated in prior years and now are requiring less intensive ADP support; however, other CFO systems will be undergoing development efforts. The Project Data System will provide management and operating contractors, field offices and headquarters program offices with automated access to a centralized database and processing functions for producing consistent project data sheets. The CFO is charged with developing and maintaining the largest financial information system in the Department. These funds are essential to gain savings in other areas.

ADP Support	FY 1996 ($000)	FY 1997 ($000)	Change ($000)
CFO support for LAN	$25	$15	($10)
Policy support for LAN and Juris/Lexis Nexis	41	34	(7)
Compliance support for LAN and audit and tracking system	63	59	(4)
Departmental accounting support for maintenance, DISCAS maintenance, MARS development, FMS training, Payroll support, timesharing and hardware maintenance. Budget support for LAN, Financial Management Enhancement, Funds Distribution System, Budget Tables and Project Data System	3,643	3,624	(19)
Headquarters Accounting support for LAN, software/hardware maintenance and upgrades, MARS implementation and timesharing	562	541	(21)
Capital Acquisitions	185	245	60
Total CFO ADP Support	**4,519**	**4,518**	**(1)**

IV. Explanation of Average FTE Costs:

The increase in average FTE costs from $97,000 in FY 1996 to $105,000 in FY 1997 reflects funding that includes fixed costs incurred for the three Centers of Excellence and outsourcing the payroll. The FTEs have decreased due to streamlining the budget function and outsourcing the payroll function.

1780

BOARD OF CONTRACT APPEALS

PROGRAM MISSION

The Board of Contract Appeals is an administrative tribunal, responsible to the Secretary and under law for the fair and impartial trial and adjudication of a variety of disputes. With few exceptions, these disputes are related to the Department's acquisition and financial assistance programs. The Board exercises an array of statutory and delegated authorities. Board decisions constitute final agency decisions and are not subject to administrative review or modification. The Board has an extensive Alternative Dispute Resolution program and is the Department's primary source of neutrals for out-lay related disputes.

The GOAL of the Board of Contract Appeals is to:

Provide to the fullest extent practicable, informal, expeditious, and inexpensive resolution of contract and financial assistance related disputes pursuant to the Contract Disputes Act of 1978, the Alternative Disputes Resolution Act and other authority.

The OBJECTIVES related to the Board's goal are:

- To contribute to mutually beneficial relationships between the Department and its contractors and financial assistance recipients.
  - Hear and decide disputes or resolve them through alternative means, vindicating the Department's and the contractor's or recipient's contractual expectations in an expeditious, economical, fair, and impartial manner.
- To advance the implementation of alternative dispute resolution.
  - Contract dispute resolution without trials and decisions, saves substantial public and private resources in appropriate cases.

Performance Measures:

The Board's performance measures are derived from the Contract Disputes Act which requires the Board to provide to the fullest extent practicable, informal, expeditious, and inexpensive resolution of disputes. To that end, at the outset of most cases, the Board, after consultation with the parties, issues a Comprehensive Scheduling Order which sets out time limits to be met by the parties for various stages of the case. These limits are designed to advance the speed and control the costs of litigating the case as well as to enhance the prospects of settlement, all without compromising fairness. Scheduling orders are carefully monitored to ensure fairness and compliance.

Major Activities:

- Adjudication: Adjudicate disputes between the Department and its contractors under the Contract Disputes Act proceeding in a manner similar to a Federal District Court without jury. Provide similar services with respect to financial assistance, patent, and licensing controversies. The Department is an adversary party in these proceedings and the Board's decisions are not reviewed by the Department.

- Mediation: Mediate and provide other neutral services to assist in the resolution of disputes between the Department and its contractors and between the Department's cost contractors and their subcontractors.

- Find Facts: Receive evidence and find facts relating to proposed debarments and suspensions of contractors and financial assistance recipients.

1782

BOARD OF CONTRACT APPEALS

I. Mission Supporting Goals/Ongoing Responsibilities:

The goal of the Board of Contract Appeals is to provide to the fullest extent practicable, informal, expeditious, and inexpensive resolution of contract and financial assistance related disputes pursuant to the Contract Disputes Act of 1978, the Alternative Disputes Resolution Act and other authority.

Program Direction has been grouped into four categories:
Salary and Benefits provide funding for full-time permanent and other than full-time permanent employees, in the following classes: salary and wages, overtime pay, cash incentive awards, lump sum leave payments, buy out compensation, and payments to funds for the benefit of employees.

Travel funding for staff to conduct trials, typically at courthouses and other neutral sites and for employee training travel.

No support Services.

Other related expenses include funding for employee training and development ($1K), and funding to support the Working Capital Fund for printing and graphics ($5K).

1783

II. Funding Table:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salary and Benefits	$ 750	$ 557	$ 0	$ 557	$ 566
Travel	7	6	0	6	6
Support Services	0	0	0	0	0
Other Related Expenses	6	1	5	6	6
Subtotal, Program Direction	$ 763	$ 564	$ 5	$ 569	$ 578
Prior Year Balances, Used	$ -131				
Full Time Equivalents	8	6		6	6
Average Cost/FTE	$ 79	$ 94		$ 95	$ 96
Adjustment	$ 131				
Budget Authority	$ 763	$ 564		$ 569	$ 578

1784

III. Performance Summary: Board of Contract Appeals

FY 1995 Measurable Performance Activities:

- Trial and Adjudication of Disputes: Tried and decided a wide range of important contract dispute appeals pursuant to the Contract Disputes Act of 1978, and financial assistance appeals pursuant to delegated Secretarial authority.
- Alternative Dispute Resolution Services: Established new alternative dispute resolution (ADR) service to complement Board's adjudicatory functions. Replaces ad hoc approach to ADR. Designated by Department as principal source of mediators for contract disputes. Published innovative 70-page ADR Handbook which includes model ADR agreements. Over 500 copies of Handbook requested by members of public. Conducted successful mediations.
- New Procedures Accelerating Case Processing: Increased use of facsimile in document filings and order issuance, saving as much as 10% in processing times. Full integration of ADR into adjudicatory processes.

III. Performance Summary: Board of Contract Appeals

- Rulemaking: Developed new rules now under review in Department prior to publication for comment. Rules are intended to facilitate public understanding of Board functions, authorities and procedures and simplify access to Board services. Once adopted they would consolidate and clarify Board authorities, cross-reference rules of procedure for various Board jurisdictions, state ADR policies and provide express enabling authority, implement the new higher dollar limits for Expedited and Accelerated cases as provided by the Federal Acquisition Streamlining Act, and lastly, eliminate several anachronistic rules.

FY 1996 Measurable Performance Activities:

- Complete the training program to qualify all judges to serve as mediators.
- Continue outreach activities intended to inform the general public, Departmental and contractor personnel, and attorneys of Board's services, including alternative dispute resolution.
- Continue maintenance of tight internal target dates for case completion.

FY 1997 Measurable Performance Activities:

- Maintain optimum balance between thoroughness of process, time and costs.
- Reduce financial and other costs to DOE and its contractors through cost effective proceedings.
- Improve outreach activities intended to inform the general public, DOE, contractor personnel, and attorneys of services.
- Continue maintenance of tight internal target dates for case completion.

1785

III. Performance Summary: Board of Contract Appeals

IV. Explanation of Funding Changes FY 1996 to FY 1997:

On a comparable basis, using Budget Authority, the increase of $ 9K in Personnel Compensation and Benefits reflects the full effect of the FY 1996 pay raise, the partial year effect of the FY 1997 pay raise, the furlough savings in FY 1996, and the restoration of awards and overtime; partially offset by other base salary adjustments.

V. Explanation of Average FTE Costs:
The average FTE cost increase of $1K/FTE is related to the personnel compensation and benefits increase discussed above.

1786

CONGRESSIONAL, PUBLIC, AND INTERGOVERNMENTAL AFFAIRS

PROGRAM MISSION

The mission of the Office of Congressional, Public, and Intergovernmental Affairs is to promote Departmental policies, programs and initiatives by facilitating the flow of information and advice to Congress, State, local, and Native American governments, and other Federal agencies (our "customers"); to create early customer involvement in the decision-making process; to coordinate Departmental activities and issues; to develop and implement legislative strategies; communicating DOE's missions and benefits to our customers; and building trust through the release of timely, responsive, factual information to the media, stakeholders, and the general public. Recognizing the Secretary's mandate that openness is essential to accountability and trust, this office works to provide substantial contributions to keeping our customers informed by continuously improving and developing partnerships with our constituent groups on a day-to-day basis. Public awareness concerning the preservation of our environment while encouraging economic growth is critical to our mission. The office maintains an aggressive outreach program directed at Departmental stakeholders to develop and preserve a positive reputation with congressional, public, and intergovernmental customers and to improve our promptness in responding to requests.

1787

GOALS

- Build DOE credibility and trust by developing and maintaining a positive relationship with customers.
- Provide value-added strategic advice to internal customers.
- Increase value of products and services through customer focus, quality management principles, and information management technology.
- Maximize resources and support employees to their full potential.
- Lead the implementation of the Communications and Trust Strategic Plan.
- Lead or participate in matrix management activities to accomplish the goals of the Department.

OBJECTIVES

- Learning customer needs, seek earlier participation, provide timely heads-up to appropriate officials, and respond promptly to customer requests and delivery on commitments.

- Principal coordinator in implementing the Department's legislative agenda, evaluate and assess how Congressional is meeting customers' needs, ensure that Congressional activities are handled in a smooth, timely, efficient and complete manner, create a standardized, practical and inclusive process to identify and manage situations requiring a quick response, ensure that intergovernmental and the public's concerns are represented in the Department's activities and integrate congressional, public, and intergovernmental activities through a closer working relationship with program and field office's to enhance communication and trust.

- Restructure and flatten organization, define specific roles, responsibilities, and relationships of individuals in organization and provide expertise on outreach activities through matrix teams within organization as well as with program offices and the field.

- Develop technology-based flexible management information system, expand system to meet customers' needs for information, and educate and inform internal and external customers on new systems.

PERFORMANCE MEASURES

Levels of performance measurements, being responsive and trustworthy, are based on customer satisfaction, leadership commitment, labor/management partnering, and employee involvement.

1788

CONGRESSIONAL, PUBLIC, AND INTERGOVERNMENTAL AFFAIRS

I. Mission Supporting Goals and Objectives:

The goal of the Office of Congressional, Public, and Intergovernmental Affairs is to promote Departmental policies, programs and initiatives by facilitating the flow of information and advice to Congress, State, local, and Native American governments, other Federal agencies, media, stakeholders, and the general public.

Program Direction has been grouped into four categories:
Salary and Benefits provide funding for full-time permanent and other than full-time permanent employees, in the following classes: salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, Senior Executive Service and other performance awards, payments to funds for the benefit of employees, buyout compensation, and workmans compensation.

Travel provides funding for staff travel for site visits to facilities of interest to Congress; to arrange and lead all media events, to accompany the Secretary, Deputy Secretary, and Under Secretary at public appearances; to attend conferences and meetings with State and local governments, American Indian tribal officials; and meetings with consumer, business and community groups to convey DOE initiatives and policies; and travel associated with training.

Other Related Expenses provides funding for employee training and development, and funding for items included in the Working Capital Fund, for example, utilities, building operations and maintenance, postage, telephone service, printing and graphics, copying, and etc.

Program Support includes contractual support for **Public Affairs** and **Consumer Affairs**. Public Affairs provides funding for the delivery of DOE news releases to media bureaus; radio and television broadcasts, electronic newswire and clipping services from major media markets; newspaper delivery; video duplication; and transcription services for media events. Consumer Affairs includes funding for public service announcements and bimonthly distribution to 300 radio stations nationwide; DOE consumer and public liaison radio programs (approximately twelve five-minute programs) and reproduction and distribution to 103 radio stations; and the Consumer Resource Handbook printing and distribution costs.

1789

II. Funding Schedule:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salary and Benefits	$9,378	$8,051	$12	$8,063	$9,029
Travel	159	120	0	120	120
Support Services	0	0	0	0	0
Other Related Expenses	1,834	7	1,849	1,856	1,975
Subtotal, Program Direction	$11,371	$8,178	$1,861	$10,039	$11,124
Prior Year Balances Used	$-635			$200	
Full Time Equivalents	118	110		110	99
Average Cost Per FTE	$91	$74		$93	$112
Consumer Affairs	$46	$40		$40	$40
Public Affairs	$54	$50		$50	$65
Prior Year Balances Used	$5				
Adjustment	$630			$-200	
Budget Authority	$11,471	$8,268		$10,129	$11,229

III. Performance Summary:

FY 1995 Measurable Performance Activities:

In support of serving as an intermediary with Members of Congress, the news media, consumer groups and industry, the general public, and the States, staff resources:

--Assisted program offices in their preparation of lead testimony and accompanied senior Departmental officials to approximately 104 hearings;

III. Performance Summary: Congressional, Public, and Intergovernmental Affairs (Cont'd)

--Attended over 3,100 briefings and meetings and over 80 committee markups in performance of their liaison functions; and
--Responded to over 12,000 telephone and/or walk-in inquiries.
--Coordinated 120 Press Conferences and prepared over 100 press releases and numerous notes to editors and briefs.

- Researched, prepared, and/or reviewed:
  --250 Daily Reports and 52 Weekly Reports for senior Departmental officials providing detailed congressional/ intergovernmental/public affairs information on meetings, hearings, mark-ups, site visits and other major events;
  --700 Communications Plans announcing major policy and program announcements;
  --104 reports on Congressional hearings, coordination of 194 hearing statements, 1,800 pre- and post-hearing Questions and Answers; 149 inserts for the record, and 1,000 congressional letters relating to hearings;
  --2,544 contract and grant notifications for Members of Congress requiring over 8,000 congressional notifications;
  --5,700 notifications to Governors/Tribal leaders/American Indian Organizations/consumer groups and industry of major actions;
  --3,200 pieces of Congressional correspondence, developed with program offices on program/policy issues;
  --100 briefing books/papers regarding Congressional hearings and meetings,
  --200 invitations for meetings or appearances by the Secretary and other principal Departmental officers with intergovernmental or public liaison groups;
  --535 biographies developed for Members of Congress (including energy-related information, Committee assignments, energy and environment-related legislation sponsored and co-sponsored by Member(s), background information on Departmental facilities in Member's District/State, and major energy interests and concerns); and
  --175 State Briefing Papers prepared for Administration officials covering energy issues and concerns for the relevant State.

- In support of the Department's mission:
  --Worked with program offices to develop legislative approaches concerning the Department's budget and key legislation;
  --Conducted meetings on Indian Issues to implement the Department's American Indian Policy;
  --Coordinated efforts to encourage intergovernmental public interest group policy positions supportive of Administration policies and initiatives resulting in the adoption of over 10 resolutions supporting Departmental interests;
  --Provided general intergovernmental policy advice and support to Departmental program and operation offices through more than 2500 personal contacts and reviewed over 400 program proposals, concurrence and correspondence for intergovernmental impact;
  --Provided early warning to program officials on energy issues in the States, most of which dealt with environmental and waste management matters;
  --Reviewed/approved over 175 publications, exhibits and audiovisuals of Departmental activities;

III. Performance Summary: Congressional, Public, and Intergovernmental Affairs (Cont'd)

--Managed the daily newsclips function which compiled articles from 50 major newspapers, five regional papers, eight weekly magazines/journals and produced/distributed 716 copies of news, magazine, and regional clips;
--Responded to over 9,100 press inquiries;
--Prepared talking points for over 180 meetings for the Secretary's presentations;
--Assisted, advised, and/or prepared speeches, talking points, and presentations for Secretarial Officers.
--Co-sponsored the first interagency workshop and conference on crisis communications;
--Communicated guidance and coordination with public affairs offices at the field laboratories and facilities sharing communications problems, messages, and major announcements;
--Conducted the first special environmental management-focused press officer training plus risk communication training;
--Coordinated the development of the first multimedia presentation program/database that can be shared between sites; and
--Instituted an on-demand series of communications training sessions for Departmental officials likely to participate in news media interviews.

FY 1996 Measurable Performance Activities:

- Serve and establish a closer working relationship with the Congress, State, Local, and Native American governments, other Federal agencies, news media, stakeholders, and the general public to ensure they are kept apprised of the Department's mission of energy resources, national security, economic productivity, environmental quality, and science and technology.

- Communicate the Secretary's vision for the Department; including openness in providing information; internal communication; build credibility with customers; pursue innovative partnerships; conduct major presentations to stakeholders and the media; implement internal communication strategy, and communications and trust strategic plan.

- Streamline our resources and continue to re-engineer and utilize team matrixes to achieve optimal dissemination of information as well as coordination with Program and Field offices.

FY 1997 Measurable Performance Activities:

- Serve and work with our customers to ensure they are kept apprised of the Department's critical mission. Also, communicate the Secretary's vision for the Department.

- Continue to re-engineer and utilize team matrixes to achieve optimal utilization of staff to provide for dissemination of information as well as coordination with Program and Field offices.

1792

IV. Explanation of Funding Changes FY, CY, to FY BY:

On a comparable basis, using Budget Authority, the increase of $966K in Personnel Compensation and Benefits reflects the full effect of the FY 1996 pay raise, the partial year effect of the FY 1997 pay raise, furlough savings in FY 1996, restoration of awards and overtime, the use of prior year balances in FY 1996 and buyout costs for FY 1997, partially offset by a decrease of 11 FTE's.

On a comparable basis, using Budget Authority, the increase of $119K in Other Related Expenses reflects inflation for items included in the Working Capital Fund.

The increase of the $15K in the Public Affairs Contractual Support reflects the FY 1995 operating level.

V. Explanation of Average FTE Costs:

The average FTE cost increase of $19K/FTE is related to the Personnel Compensation and Other Related Expense increases discussed above.

1793

GENERAL COUNSEL

PROGRAM MISSION

The Office of General Counsel is responsible for providing comprehensive legal services to the Secretary and the Department. These services include legal counsel with respect to every program and function of the Department, except those relating to the Federal Energy Regulatory Commission and Environment, Safety, and Health's administrative enforcement activities related to Nuclear Safety. General Counsel assures that the Department operates in compliance with applicable laws and its existence is mandated by Public Law 95-91,Section 202(b).

The GOALS of the Office of General Counsel are to:

- Anticipate the needs of the Secretary and the Department and to provide timely, sound, responsive, and innovative legal counsel and services.

- Advance the interests of the Secretary and the Department through negotiation, dispute resolution, rulemaking, legislation, and, when necessary, litigation.

The OBJECTIVE related to these goals is to:

Provide Legal Support towards the Secretary's and the Department's missions of:

- Protecting National Security and Reducing the Nuclear Danger

- Enhancing Energy Security

- Environmental Cleanup and Stewardship

- Advancing Frontiers of Science and Technology

MAJOR ACTIVITIES:

- General Counsel is responsible for review of proposed Departmental actions and the defense of those matters through both judicial and administrative litigation in federal and state courts, at the trial and appellate levels. Because of the diversity and magnitude of the

Department's activities, a single office within General Counsel may be responsible for providing legal services with respect to as many as 50 different statutes, and the legal expertise required may encompass the entire range of the law, from issues of constitutional proportions to personnel law matters affecting individual employees.

- General Counsel is responsible for enforcing the provisions of the Emergency Petroleum Allocation Act of 1973.

- General Counsel is responsible for conducting several programs of Department-wide application. The Intellectual Property program manages and protects the Department's wealth of intellectual property, whether it be in the form of a patent, trademark, or copyright, that results from the billions of dollars invested in the Department's research and development activities. The Standards of Conduct program implements the ethical standards requirements of the Department of Energy Organization Act and other statutes and regulations with which current and former employees must comply.

- General Counsel is also involved in the development and/or implementation of policies and procedures in the areas of rulemaking and alternative dispute resolution.

- General Counsel assists other departmental elements by providing legal support to their programs, such as the drafting and review of proposed legislation.

PERFORMANCE MEASURES:

- The Intellectual Property Program expects to have processed 5,000 and 7,000 - 7,500 actions associated with patents, invention disclosures, and waiver requests for Fiscal Years 1996 and 1997 respectively , dependent upon future funding.

1795

GENERAL COUNSEL

I. Mission Supporting Goals/Ongoing Responsibilities:

The goals of the Office of General Counsel are to anticipate the needs of the Secretary and the Department and to provide timely, sound, responsive, and innovative legal counsel and services; and advance the interests of the Secretary and the Department through negotiation, dispute resolution, rulemaking, legislation, and when necessary, litigation.

Program Direction has been grouped into four categories:
Salary and Benefits provide funding for full-time permanent and other than full-time permanent employees, in the following classes: salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, Senior Executive Service and other performance awards, payments to funds for the benefit of employees, buy out compensation, and workmans compensation.

Travel provides funding for attorneys to attend hearings, court trials, proceedings, and to take depositions at all DOE sites. Travel also provides funding for conference attendance, and employee training travel.

Support Services finance technical and management support services for this organization including: maintenance of the DOE law library; patent attorneys to process patent waivers, licenses, and clearances; and consulting services to receive, process and track 5,000 inventions and patent documents.

Other related expenses provides funding for DOE law library acquisitions, employee training and development, and funding for items included in the working capital fund, for example, utilities, building operations, and maintenance, supplies, telephone service, etc.

1796

III. Performance Summary: General Counsel

II. Funding Table:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salary and Benefits	$ 13,879	$ 14,820	$ 50	$ 14,870	$ 16,434
Travel	154	136	0	136	136
Support Services	1,350	1,035	0	1,035	1,255
Other Related Expenses	2,782	315	2,521	2,836	3,012
Subtotal, Program Direction	$ 18,165	$ 16,306	$ 2,571	$ 18,877	$ 20,837
Prior Year Balances, Used	147			300	
Full Time Equivalents	163	172		172	178
Average Cost/FTE	$ 112	$ 95		$ 112	$ 117
Adjustment	$ -147			-300	
Budget Authority	$ 18,165	$ 16,306		$ 18,877	$ 20,837

1797

III. Performance Summary:

FY 1995 Measurable Performance Activities:

- Continued to ensure that effective and timely legal services, counsel, and support are provided to the appropriate Departmental elements and to represent the Department as counsel before Federal, State, and other governmental agencies and courts.
- Negotiated accords with approximately 80 companies participating in the Department's Climate Challenge Program.

- The Intellectual Property Program processed 7,000 - 7,500 actions associated with patents, invention disclosures, and waiver requests.

FY 1996 Measurable Performance Activities:

- Continue to ensure that effective and timely legal services, counsel, and support are provided to the appropriate Departmental elements and to represent the Department as counsel before Federal, State, and other governmental agencies and courts.

- The Intellectual Property Program expects to process 5,000 actions associated with patents, invention disclosures, and waiver requests.

FY 1997 Measurable Performance Activities:

- Continue to ensure that effective and timely legal services, counsel, and support are provided to the appropriate Departmental elements and to represent the Department as counsel before Federal, State, and other governmental agencies and courts.

- The Intellectual Property Program expects to process 7,000 - 7,500 actions associated with patents, invention disclosures, and waiver requests.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

On a comparable basis, using Budget Authority, the increase of $1.6M in Personnel Compensation and Benefits reflects an increase of 6 FTEs plus the full effect of the FY 1996 pay raise, the partial year effect of the FY 1997 pay raise, furlough savings in FY 1996, restoration of awards and overtime, and the use of prior year balances in FY 1996.

Support Services increase of $220K reflects the funding necessary to support the Department's patent activities and to reduce the current backlog of patents, invention disclosures, and waiver requests .

On a comparable basis, using Budget Authority, the increase of $176K in Other Related Expenses reflects inflation for items included in the Working Capital Fund.

V. Explanation of Average FTE Costs:

The average FTE cost increase of $5K/FTE is related to the Personnel Compensation and Benefits, Support Services, and Other Related Expenses increases discussed above.

1798

POLICY

PROGRAM MISSION

The Policy Office (PO) provides leadership and support to the Secretary and the Department for establishing and improving policies and programs to meet DOE's mission in the areas of energy resources, science and technology, environmental quality, national security, and economic productivity. PO accomplishes these functions through analyses of national and international issues, coordination and implementation of cross-cutting departmental program activities, and guidance and assistance for strategic planning, budget formulation, and program evaluation.

The Goals of the Policy Office are to:

- On behalf of the Secretary of Energy, develop effective and efficient governmental policies and priorities, consistent with the Departmental mission and vision.
- Ensure effective and consistent implementation and communication of Administration and Departmental policies and priorities.
- Ensure attention to energy needs and policy perspectives as decisions with significant energy implications are considered by other Departments and agencies.
- Effectively use international community to advance energy, environmental, and non-proliferation policies in international agreements and foreign nations that support U.S. policy goals.
- Provide for the effective implementation of all Policy Office programs.

1799

The specific roles unique to the Policy Office that will enable the successful accomplishment of the Department of Energy's mission and goals are:

Policy Developer: The Policy Office identifies and analyzes policy issues, helps define long-term goals, objectives, and priorities, and mobilizes appropriate program offices.

Policy Advisor: The Policy Office provides the Secretary, Deputy Secretary and the Under Secretary independent analysis and program assessments. PO has no vested or parochial interests in specific DOE programs. During the decision-making process, the Secretary is assured of impartial and unbiased policy advice.

Policy Coordinator: PO is the central DOE organization that develops policy initiatives and strategies on issues that cut across more than one program area. PO prevents "stovepipe" policies by facilitating the development of an integrated policy approach across all of the Department's functions that are aligned with core national goals and objectives. These ongoing responsibilities also include coordination of the Department's international activities.

Policy Communicator: PO is the communication link between DOE and its stakeholders. PO ensures that the views of the White House, Congress, public and private sector organizations, and foreign countries are addressed in the policy making process. PO is the Department representative on many domestic and international policy initiatives and provides information on departmental, national, and international policies, strategies, and trends.

Policy Oversight: PO ensures that Secretarial policies and priorities are implemented throughout the development of departmental strategic plans, formulation of the budget, and the evaluation of program performance against Secretarial commitments.

1800

OFFICE OF POLICY

I. Mission Supporting Goals/Ongoing Responsibilities

In this era of radically shifting priorities and sharply reducing budgets, the Secretary and the Department increasingly rely on the Policy Office to establish clear goals, analyze policy impacts, mobilize resources, and launch new initiatives to reduce the cost and enhance the effectiveness of our programs. The goals of the Policy Office are to: develop policies based on sound analysis that support the Department's vision and fulfill the Department's missions; provide accurate and unbiased analysis of existing and prospective policies in the areas of energy, environment, science and technology and national security; ensure attention to energy needs and perspectives as decisions with significant energy implications are considered by other departments and agencies; ensure effective communication of Administration and Departmental policies, priorities, objectives, and measurements; and to use the international community to advance energy, environmental, and non-proliferation policies in international agreements and foreign nations that support U.S. policy goals.

Program Direction has been grouped into four categories:
Salary and Benefits provide funding for full-time permanent and other than full-time permanent employees, in the following classes: salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, Senior Executive Service and other performance awards, payments to funds for the benefit of employees, workmans compensation, and buy out compensation.

Travel provides funding for staff travel to DOE sites for strategic planning and oversight purposes; to attend energy policy development meetings nationwide; and employee training travel. International travel is required in the development and implementation of international energy/environmental policy; matters concerning international energy/environmental related negotiations, to attend conferences and meetings; and to represent the Department as members of international energy and environmental organizations.

Other Related Expenses includes funding for activities such as: reimbursement to the Department of State for DOE overseas offices in Tokyo and Moscow; embassy related services for DOE delegations, such as interpreters, facilities and motor pool services; includes translation services for meetings at DOE and with foreign governments, acquisition and maintenance of ADP equipment, systems support for the Foreign Visits and Assignments and the Foreign Travel and Tracking Systems, employee training; and funding for items included in the Working Capital Fund, for example, utilities, building operations, and maintenance, postage, printing and graphics, supplies, telephone services, etc.

Program Support includes **Policy Analysis, and Systems Studies** and **Environmental Policy Studies.** These accounts are used to generate information critical to the policy mission. The source of this critical information is from outside sources, such as the National Laboratories, academia, and specialized technical contractors. Topics addressed include evaluation of proposed regulations potentially affecting the energy

1801

system, modeling to assess the economic and energy impacts of climate change policy, and analysis of alternative fuels options. These studies, which tap expertise of leading national experts, leverage the effectiveness of the Office in internal and interagency policy development processes.

II. Funding Table:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salary and Benefits	$ 15,108	$ 14,625	$ 47	$ 14,672	$ 15,843
Travel	671	537	0	537	537
Support Services	0	0	0	0	0
Other Related Expenses	3,225	533	2,612	3,145	3,821
Subtotal, Program Direction	$ 19,004	$ 15,695	$ 2,659	$ 18,354	$ 20,201
Prior Year Balances, Used	$ 1,506			$ 300	
Full Time Equivalents	196	183		183	172
Average Cost/FTE	$ 105	$ 86		$ 102	$ 117
Policy Analysis,&Systems Studies	$ 3,505	$ 2,900		$ 2,900	$ 3,493
Environmental Policy Studies	$ 6,070	$ 4,000		$ 4,000	$ 4,928
Prior Year Balances, Used	$ 112				
Adjustment	$-1,618			$ -300	
Budget Authority	$28,579	$ 22,595		$ 25,254	$ 28,622

1802

III. Performance Summary:

FY1995 Measurable Performance Activities

Examples of major measurable performance activities achieved in FY1995 include:

- Provided analysis, tracking, and forecasting of domestic and international energy use and greenhouse gas emissions trends that highlighted the significant challenges of emissions reduction and the need to adopt realistic, flexible, and cost-effective approaches.
- Avoided disruption in fuel markets and assured minimal increases in the consumer cost of cleaner gasoline through interagency interventions that resulted in a more streamlined and cost-effective reformulated gasoline program under the Clean Air Act.
- Completed study of economic, energy markets, and environmental effects of lifting the ban on exports of oil from the Alaska North Slope, providing a basis for a decision to lift the ban.
- Provided analysis of energy-related regulatory policies of EPA and other agencies on issues such as nitrous oxide emissions from power plants and the potential effects of mercury emissions, providing a sound scientific basis for interagency discussions of pending decisions.
- Established an inventory of precious metals within the DOE complex, and designed a program for sales of excess materials that will directly contribute to deficit reduction over the next 5 years.
- Lead the Department's privatization team that is charged with streamlining operations by spinning off functions that are properly and cost-effectively handled in the private sector.
- Co-lead the interagency Joint Implementation Initiative program that, in cooperation with U.S. industry, initiated eight pilot projects to prepare the way for U.S. access to low-cost greenhouse gas emissions abatement opportunities and energy technology markets in developing countries.

- Provided analysis and support for the Galvin Task Force on the Future of the National Laboratories and the Yergin Task Force on Strategic Energy Research and Development. These two independent, outside reviews provide important guidance on options for restructuring and streamlining DOE.

- Issued a rule governing participation of foreign companies in U.S. sponsored research and development programs, making their participation contingent on fair and recipical treatment of U.S. concerns by foreign governments.

- Coordinated energy activities under the Gore-Chernomyrdin commission, addressing areas of vital U.S. interest including initiatives to improve the safety of Russia's nuclear power plants, promote regulatory policy changes in Russia to increase market opportunities for U.S. energy technology and production companies, and achieve a shutdown of Russia's plutonium production by 2000.

- Coordinated missions on energy trade, investment, and sustainable development to India, Pakistan, African nations, Mexico, and China resulting in significant U.S. private sector investment.

- Lead dialogue with South Africa on energy regulatory reform, improving the institutional capability of this strategic country to meet the challenge of providing modern energy systems to all its citizens while expanding opportunities for U.S. vendors.

- Implemented the Government Performance and Results Act through development of the DOE Performance Agreement signed by the President and the Secretary of Energy.

- Organized and executed, in cooperation with state utility regulators, major conferences exploring the interface between State and federal regulatory responsibilities in the areas of electricity and natural gas, as well as opportunities for increased coordination of restructuring efforts across levels of government.

- Issued a National Energy Policy Plan that outlines the Administration's market-oriented approach to energy policy.

1804

FY1996 Measurable Performance Activities:

Examples of major measurable performance activities for FY1996 include:

- Initiate sales of excess precious metals, generating $15 million in revenues that will reduce the deficit.
- Achieved legislation to permit exports of Alaska North Slope crude oil based on previous analytic efforts.
- Continue analysis and interagency dialogue on key regulatory issues with substantial energy implications, including new EPA ambient air quality standards for smog and particulates, regional haze regulations, and Superfund provisions affecting refineries.
- Complete cost-benefit analysis of possible transition to a market involving significant use of alternative fuels for vehicles.
- Develop and publish analysis of cost-savings available from incorporating flexibility in the location and timing of emissions reductions commitments now under consideration by the U.S. and other governments.
- Implement recently-issued OMB guidance regarding the use of cost-benefit analysis as a part of regulatory impact assessments.
- Develop, in conjunction with industry experts, assessment of the impact of new greenhouse gas mitigation commitments on energy-intensive industries in the U.S. to help inform U.S. negotiating positions.
- Coordinate a dialogue with industry, financial institutions, and foreign interests, regarding innovative mechanisms for financing international investment in energy efficiency.
- Complete the Country Studies program, a successful multi-agency program that increases developing countries' awareness of the need for their active participation in any effective policy to address climate change.
- Coordinate U.S.- Japan bilateral energy consultations to gain access by U.S. firms to Japan's electricity sector.

1805

- Continued implementation of the Government Performance and Results Act, including publication of the FY1996 Performance Agreement and the issuance of the DOE-wide Strategic Management System.

- Implement recommendations of independent outside reviews of the National Laboratory System (Galvin Task Force) and energy R&D activities (Yergin Task Force), including initiation of peer review and prioritization programs for R&D activities

FY1997 Measurable Performance Activities

Examples of major measurable performance activities projected for FY1997 include:

- Continue asset sales and privatization initiatives to reduce the deficit and streamline DOE operations.

- Implement the Domestic Gas and Oil Initiative to simplify regulatory hurdles and remove disincentives to the domestic production of energy.

- Analyze and, if necessary, intervene in emerging fuel market issues, particularly the implementation of the "complex model" for reformulated gasoline, to avoid unnecessary cost and market disruptions while achieving environmental objectives.

- Ensure that DOE efficiency standards, alternative fuels programs, and other regulatory policies maximize net energy, economic, and environmental benefits to consumers.

- Develop U.S. positions for international protocols regarding nitrous oxides, persistent organic pollutants, and heavy metals that fall within current U.S. requirements and emphasize performance-based rather than technology-based approaches.

- Assure that new greenhouse gas reduction commitments scheduled for adoption under the Climate Convention in FY1997 are based on sound analysis, a realistic appraisal of U.S. energy needs, and up-to-date information on global energy and emissions trends.

- Assess actual effectiveness of voluntary programs included in the Administration's Climate Change Action Plan.

- Implement the Summit of the Americas Partnership for Sustainable Energy Use, while continuing to pursue additional missions and agreements in energy technology trade to expand market opportunities for U.S. exports.

- Expand and refine Department-wide prioritization of energy R&D, incorporating R&D portfolio analysis with strategic planning and budgeting to maximize cost-effectiveness.

- Develop FY1997 Performance Agreement and implement the DOE Strategic Management System.

1806

- Revise the Department's Strategic Plan.

IV. Explanation of Funding Changes FY 96 to FY 97:

On a comparable basis, using Budget Authority, the increase of $1.17M in Personnel Compensation and Benefits reflects the full effect of the FY 1996 pay raise, the partial year effect of the FY 1997 pay raise, furlough savings in FY 1996, restoration of awards and overtime, funding for buy outs, and the use of prior year balances in FY 1996; partially offset by a decrease of 11 FTEs.

On a comparable basis, using Budget Authority, the increase of $676K in Other Related Expenses reflects the use of prior year balances in FY 1996 and inflation for items included in the Working Capital Fund.

The increases of $593K in Policy Analysis, and Systems Studies and $928K in Environmental Policy Studies reflect plans for the increased use of expertise for national laboratories and the private sector to more effectively carry out assigned functions with reduced staffing levels. Specific requirements are driven by the planned regulatory activities of other agencies and the previously established schedule for negotiating new climate change commitments, both of which have significant energy implications, and the requirement to revise the DOE Strategic Plan in FY 1997. While this request reflects a modest increase from approved FY 1996 funding levels, it is below both the FY 1996 request and the actual FY 1995 funding level.

V. Explanation of Average FTE Costs:

The average FTE cost increase of $15/FTE is related to the Personnel Compensation and Other Related Expense increases discussed above.

1807

ECONOMIC IMPACT AND DIVERSITY

PROGRAM MISSION

The office devises and leads diversity strategies that ensure full participation of all employees, and creates full partnerships with small and underutilized businesses and minority educational institutions.

The GOALS of the ED program are to:

- Become a recognized leader among Federal agencies in managing diversity as a strategic imperative.
- Ensure equitable opportunity for small, minority, and women-owned business to compete for contracts and subcontracts.
- Promote collaborative efforts with educational institutions, federal agencies, and energy industry organizations to establish state-of-the-art research and development centers of excellence at the universities.
- Conduct on-going research programs to determine the effects (including the socioeconomic and environmental effects) of national energy programs, policies, and regulations of the Department on minorities.

The OBJECTIVES related to these goals are to:

- CONTRIBUTE TO OUR NATION'S ENERGY SECURITY AND INDUSTRIAL COMPETITIVENESS - Design initiatives for scientific training and research programs in the mathematics and science disciplines; support the development of the research and education infrastructure at Historically Black Colleges and Universities (HBCUs) and minority educational institutions; establish synergistic linkages with industry and the national energy laboratories which will increase the technical capabilities of the labor force in the energy industry and improve the current critical deficient levels.
- CONTRIBUTE TO THE ENHANCEMENT OF MINORITY EDUCATION - Supports the research and education infrastructure at educational institutions; invest in human resources at all levels of the educational curriculum through improved scientific training and research experiences in mathematics, science, and engineering for both teachers and students; utilize the resources of Federal and private sector laboratories and energy technology industries.

- PROMOTE THE GROWTH OF BUSINESS ENTERPRISES - Support economic incentives for small, disadvantaged, and women-owned businesses through focused linkages with government-funded programs, such as the Small Business Administration and the Small Business Innovative Research Programs, and to facilitate long-term investments.

PERFORMANCE MEASURES:

- Fairness and equity in the contracting process.
- Shared vision of diversity throughout the Department by assuring work force diversity.
- Increase in the Department's support of Historically Black Colleges and Universities, to improve institutional infrastructure,support scientific research, and provide state-of-the-art research equipment as part of the overall support for minority scientists, engineers, and educational institutions.
- Increase in the Department's use of small, minority, and women-owned business by the laboratories, facilities, field organizations, and headquarters.
- Increase in the Department's ability by 30% to reduce the environmental and human health risks to affected communities caused by the Department's facilities and operations.
- Increase the contribution of the research program to the National Energy Modeling System and the Annual Energy Outlook, to incorporate equity and socioeconomic characteristics in these departmental analyses.

ECONOMIC IMPACT & DIVERSITY

I. Mission Supporting Goals/Ongoing Responsibilities:

The goals of the office of Economic Impact and Diversity are to become a recognized leader among Federal agencies in managing diversity as a strategic imperative, to ensure equitable opportunity for small, minority, and women-owned businesses to compete for contracts and subcontracts, to promote collaborative efforts with educational institutions, federal agencies, and energy industry organizations to establish high technology research and development centers at the universities, and to conduct on-going research programs to determine the effects (including the socioeconomic and environmental effects) of national energy programs, policies, and regulations of the Department on minorities.

Program Direction has been grouped into four categories:
Salary and Benefits provide funding for full-time permanent and other than full-time permanent employees, in the following classes: salaries and wages, overtime pay, cash incentive awards, lump sum leave payments, Senior Executive Service and other performance awards, payments to funds for the benefit of employees, workmans compensation, and buyout compensation.

Travel provides funding to perform site visits regarding socioeconomic research and analysis and minority educational institution assistance activities, to conduct Federal employee complaint investigations, to meet with minority communities and institutions, to provide support on Secretarial trips, to sponsor the small and disadvantaged business conference, and for employee training travel.

Other Related Expenses provides funding for special emphasis programs, investigations associated with processing civil rights complaints, services related to small and disadvantaged business activities/conferences, employee training and development, and funding for items included in the working capital fund, for example, utilities, building operations, and maintenance, supplies, telephone services, printing and graphics, etc.

Program Support provides funding for development of programs addressing impacts of energy policies, programs, regulations, legislation, and other Departmental actions on minorities, minority educational institutions, minority businesses, and minority communities. Major activities include: providing nationwide assistance workshops and other outreach assistance activities to serve as an incentive for minority businesses to participate in energy activities; supporting minority education institutions by providing student stipends for science and technology disciplines; funding the enhancement and maintenance of a database of energy programs available to minority educational institutions, businesses, and contractors; funding the enhancement and maintenance of the Socioeconomic Energy Research and Analysis Program (SERAP) database (assesses the impact of energy policy on energy consumption patterns); and providing financial assistance by reimbursing financial institutions

for their program support costs associated with administering funds (low interest loans) to minority entrepreneurs (note, funds administered are obtained from the DOE Petroleum Violation Escrow account).

II. Funding Table:

	FY 1995 Comparable Appropriation	FY 1996 Original Appropriation	Real & Comp Adjustments	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Salary and Benefits	$ 4,034	$ 3,552	$ 23	$ 3,575	$ 4,012
Travel	114	96	0	96	91
Support Services	0	0	0	0	0
Other Related Expenses	777	136	557	693	733
Subtotal, Program Direction	$ 4,925	$ 3,784	$ 580	$ 4,364	$ 4,836
Prior Year Balances, Used	$ -240			$ 636	
Full Time Equivalents	51	51		51	49
Average Cost/FTE	$ 92	$ 74		$ 98	$ 99
Minority and Economic Impact	$ 3,095	$ 2,900		$ 2,900	$ 2,900
Prior Year Balances, Used	$ 372				
Adjustment	$ -132	$ -54		$ -690	
Budget Authority	$ 8,020	$ 6,630		$ 7,210	$ 7,736

III. Performance Summary:

FY 1995 Measurable Performance Activities:

- Provided $50 million to Historically Black Colleges and Universities in FY 1995.

III. Performance Summary: Economic Impact and Diversity (Cont'd)

- Increased the number of major program element participants to include 2 major partnerships with Nuclear Energy and 1 major partnership with Environmental Health.

- Supported new innovative cooperative education and employment programs at minority education institutions to diversify student employment at the Department of Energy headquarters and field facilities.

- Provided support for new chairs of excellence in science and technology related disciplines at additional Historically Black Colleges and Universities, and for the first time, an Hispanic serving institution.

- Increased the dispersion of funding support to include first time recipients at small institutions, and additional private and public institutions.

- Expanded the Minority Energy Assessment Model (MEAM) framework to include a broader spectrum of household expenditure categories. Eventually, the larger number of consumption categories will help to measure the indirect impacts of energy policy and incorporate equity factors into the National Energy Modeling System and policy decision making.

- Initiated implementation of the Department's Environmental Justice Strategy. On a nationwide level: made presentations; held meetings, hearings, and conferences; lead task forces and interagency working groups; and performed outreach and educational activities regarding the proposed strategies; and drafted guidance for specific methodologies, analyses, impact and risk assessments. Focused actions resulted in eliminating urgent risks, protecting human health, and improving the quality of the environment for communities impacted by the department's sites and facilities.

- Developed segments of the Distributive Impact Assessment Model (DIAM). DIAM will be used to quantitatively determine the impact of policies, programs, and other activities on: minority consumption and expenditure patterns, and employment and income. This will provide DOE with a capability to explicitly assess the potential impact of energy policy on minority economic welfare through its effect on consumption, employment, and income.

- Developed a Mentor-Protege Pilot Initiative program designed to encourage DOE management and operating contractors, environmental restoration management contractors, and prime contractors to assist small disadvantaged and women-owned businesses, and 8(a) firms in developing their business and technical capabilities and promote wider participation in departmental acquisition opportunities.

III. Performance Summary: Economic Impact and Diversity (Cont'd)

- Consorted with the Hispanic Radio Network to provide assistance and facilitate the compilation and dissemination of energy information to the U.S. Hispanic speaking population; the Hispanic Association of Colleges and Universities to provide high school math/science curriculum enhancement to motivated students in technical fields; the National Image to hold workshops encouraging Hispanic youths to pursue energy-related careers; the Argonne National Laboratory to implement a summer program for visiting Hispanic science students; the Society of Hispanic Professional Engineers to hold regional college competitions; and facilitated with the Mexican American State Legislators Policy Institute to establish a database for use and participation by Hispanic institutions and communities.

- Continued management and technical support for the Bank Deposit Program maintaining the goal level of $200 million.

- 154 EEO complaint cases were closed; 56 were dismissed; 18 were withdrawn; 35 settled; 45 were subject to final decision (with 3 findings of discrimination and 42 with no findings of discrimination).

- EEO counseling program processed approximately 101 counseling requests and resolved 23.

- EEO investigations conducted 112 cases with support service contractors. Initiated, monitored and reviewed support service contractors case reports.

- Partnered with other agencies in establishing a Headquarter's EEO Mediation program.

- Carried out various affirmative actions, included are developing and monitoring affirmative action plans for minorities, women, and persons with disabilities; monitoring contractor and grantee compliance guidelines. Conducted training for EEO managers/supervisors and will review the EEO Module for inclusion of diversity related content.

- At field offices, conducted routine civil rights technical assistance program review of Federal Assisted programs.

- Completed 82 pre-award civil rights reviews on applicants of DOE financial assistance; issued findings of no discrimination; prepared issue papers; provided information and technical assistance from various requestors; participated with other agencies in examining diverse affirmative action materials and resolutions.

- Conducted 11 Special Emphasis program events, promoted cultural awareness, advantages of multi-cultural work force through the development, implementation, and evaluation of programs and practices that encourage diversity throughout the agency.

III. Performance Summary: Economic Impact and Diversity (Cont'd)

- Conducted, sponsored and implemented 12 various activities in promoting the advantages of a multi-cultural and diverse work force.

FY 1996 Measurable Performance Activities:

Goal 1: Partner with the Community

- Partner with the public, and especially the private sector to leverage DOE capabilities in support of minority business communities.
- Achieve environmental justice and accountability for improved environmental regulations and legislation.
- Improve the Bank Deposit Financial Assistance program by linking deposits to identified minority business opportunities
- Provide educational outreach in diverse communities.
- Develop analytical and data tools to assess the distributive effects of policies, programs, and activities associated with DOE's five business lines; industrial competitiveness, energy resources, science and technology, national security, and environmental quality; and conducted a workshop to disseminate the information and methods to our stakeholders.

Goal 2: Partner with Minority Educational Institutions

- Facilitate collaborative research and development efforts between educational institutions and the Department's national laboratories by sharing facilities and human resources.
- Support participation of minority educational institutions in "cutting edge" science and technology research and development.
- Reduce barriers by streamlining processes for technology transfer and facilitating the rapid commercialization of technology advances.
- Provide developmental funds for cooperative programs which encourage under represented students to pursue science, engineering and technology careers.

III. Performance Summary: Economic Impact and Diversity (Cont'd)

- o Develop strategies to fuse the education and training missions of the universities with the needs of the energy industry and the basic research need of our national laboratories.

- o Develop and support infrastructure at universities to enhance physical and laboratory facilities, scientific instrumentation, research and library holdings.

Goal 3: Enhance Partnerships with Small, Minority and Women-Owned Businesses

- o Review all procurement requests valued in excess of $3 million to insure maximum opportunities for minority business enterprises. Ensure equitable opportunity to compete for subcontracts.

- o Provide technology transfer opportunities.

- o Implement mentor-protege initiative.

- o Increase access of minority entrepreneurs to technologies and scientific expertise found in Department's laboratories and facilities.

- o Maximize opportunities in environmental and energy efficiency and renewable areas.

Goal 4: Strengthen Partnerships with Employees

- o Establish shared values throughout the Department in support of our vision of diversity. Integrate diversity into the Department's total quality management initiatives.

- o Continue Diversity Council initiatives and training. Partner with the Office of Personnel to (1) Incorporate diversity goals into performance reviews and reward systems, (2) Ensure career development and training opportunities are utilized to support diversity goals, (3) Integrate work force diversity goals with operational and organizational activities.

FY 1997 Measurable Performance Activities:

Goal 1: Partner with the Community

- o Achieve environmental justice and accountability for improved environmental regulations and legislation.

III. Performance Summary: Economic Impact and Diversity (Cont'd)

- Partner with the public, and especially the private sector to leverage DOE capabilities in support of minority business communities.
- Partner with Hispanic community leaders.
- Provide educational outreach in diverse communities.
- Develop analytical and data tools to assess the distributive effects of policies, programs, and activities associated with DOE's five business lines; industrial competitiveness, energy resources, science and technology, national security, environmental quality; and conducted a workshop to disseminate the information and methods to our stakeholders.

Goal 2: Partner with Minority Educational Institutions

- Facilitate collaborative research and development efforts between educational institutions and the Department's national laboratories by sharing facilities and human resources.
- Support participation of minority educational institutions in "cutting edge" science and technology research and development.
- Reduce barriers by streamlining processes for technology transfer and facilitating the rapid commercialization of technology advances.
- Provide developmental funds for cooperative programs which encourage under represented students to pursue science, engineering and technology careers.
- Develop strategies to fuse the education and training missions of the universities with the needs of the energy industry and the basic research need of our national laboratories.
- Develop and support infrastructure at universities to enhance physical and laboratory facilities, scientific instrumentation, research and library holdings.

Goal 3: Enhance Partnerships with Small, Minority and Women-Owned Businesses

- Review 8(a) competitive procurement awards exceeding the $3 million level to insure maximum opportunities for minority business enterprises. Ensure equitable opportunity to compete for subcontracts.

III. Performance Summary: Economic Impact and Diversity (Cont'd)

- o Provide technology transfer opportunities.
- o Implement mentor-protege initiative.
- o Increase access of minority entrepreneurs to technologies and scientific expertise found in Department's laboratories and facilities.
- o Maximize opportunities in environmental and energy efficiency and renewable areas.

Goal 4: Strengthen Partnerships with Employees

- o Establish shared values throughout the Department in support of our vision of diversity. Integrate diversity into the Department's total quality management initiatives.
- o Continue Diversity Council initiatives and training. Partner with the Office of Personnel to (1) Incorporate diversity goals into performance reviews and reward systems, (2) Ensure career development and training opportunities are utilized to support diversity goals, (3) Integrate work force diversity goals with operational and organizational activities.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

On a comparable basis, using Budget Authority, the increase of $437K in Personnel Compensation and Benefits reflects the full effect of the FY 1996 pay raise, the partial year effect of the FY 1997 pay raise, furlough savings in FY 1996, restoration of awards and overtime, and the use of prior year balances in FY 1996; partially offset by a decrease of 2 FTEs.

The decrease of $5K in travel is in compliance with the president's administrative savings initiative.

On a comparable basis, using Budget Authority, the increase of $40K in Other Related Expenses reflects inflation for items included in the Working Capital Fund and the use of prior year balances in FY 1996.

V. Explanation of Average FTE Costs:

The average FTE cost increase of $1K/FTE is related to the Personnel Compensation and Other Related Expense increases discussed above.

COST OF WORK FOR OTHERS

I. Mission Supporting Goals/Ongoing Responsibilities:

The Cost of Work for Others (CWO) program provides finding to the Department of Energy's (DOE) multi-purpose field offices and national laboratories to finance the cost of products and services requested by non-DOE users, both foreign and domestic. The products and services provided by the Department under this program generally are not available from alternate sources and 1) are a revenue program which results from a budgeted mission of the Department; or, 2) are reimbursable work for non-federal entities where the sponsor is precluded by law from providing advance funding. The costs of the Cost of Work for Others program are offset by revenues received from the sale of products and services to our customers.

The goals for this program are continued access to the department's laboratory complex and availability of by-products for sale to these non-federal customers. The CWO program satisfies the needs of our non-federal customers. For this reason, performance evaluation for this work is the responsibility of our customers. The success of this program is indicated by the steady stream of business from the targeted groups.

II. Funding Table:

Total, Revenues Associated	FY 1995	FY 1996	FY 1997	$ Change	% Change
Products Sold:					
Oakland	$ 0	$ 0	$ 0	$ 0	0

1819

III. Performance Summary:

FY 1995 Measurable Performance Activities:

PRODUCTS SOLD:

ETEC - The Sodium Component Test Installation (SCTI) at ETEC was shut down in FY 1995. However, the facility was used to test the Kalina cycle.

Savannah River - Costs associated with forest management and the sale of timber operated by the U.S. Forest Service.

PRODUCTS SOLD:

Savannah River - Costs associated with forest management and the sale of timber operated by the U.S. Forest Service.

SERVICES PERFORMED:

Albuquerque - Miscellaneous services for state and local governments, such as, highly specialized computer and automation support at the Sandia and Los Alamos National Laboratories and sale of utilities (water) to the County of Los Alamos at Los Alamos National laboratory.

Argonne - Work for state and local governments such as the Illinois Department of Energy and Natural Resources.

Brookhaven - Publication of Pergamon Press and miscellaneous activities for state and local governments.

Chicago - Certified reference materials used by the Nuclear community at the New Brunswick Laboratory.

Idaho - Irradiation services and storage of Three Mile Island (TMI) abnormal waste (reactor filters).

Lawrence Berkeley - Work for state and local governments and non-profit organizations such as seismic monitoring techniques for the State Lands commission and various services for universities.

Lawrence Livermore - Miscellaneous services performed for state and local governments such as earthquake analysis for the State of California.

Oak Ridge - Miscellaneous services for state and local governments (including providing treated water to the city of Oak Ridge) and universities.

Oak Ridge National Lab - Miscellaneous services for state and local governments.

Office of Scientific and Technical Info - Operation of the Superconductivity Information System and the National Energy Software Center, both of which provide central depositories of these valuable Departmental resources for use by DOE researchers, as well as outside users.

Richland - Miscellaneous services at Pacific Northwest Laboratory (PNL) and Kaiser Engineering.

Oakland - Particle physics collaboration with Japan and other development efforts at the Stanford Linear Accelerator Center (SLAC).

National Renewable Energy Laboratory - State and local government services.

FY 1997 Measurable Performance Activities:

PRODUCTS SOLD:

Savannah River - Costs associated with forest management and the sale of timber operated by the U.S. Forest Service.

Albuquerque - Miscellaneous services for state and local governments, such as , highly specialized computer and automation support at the Sandia and Los Alamos National Laboratories and sale of utilities (water) to the County of Los Alamos at Los Alamos National Laboratory.

Argonne - Work for state and local governments such as the Illinois Department of Energy & Natural Resources and Collaborative Access Teams of Universities seeking access to DOE technology.

Brookhaven - Publication of Pergamon Press and miscellaneous activities for state and local government.

Chicago - Certified reference materials used by the Nuclear community at the New Brunswick Laboratory.

Idaho - Irradiation services and storage of Three Mile Island (TMI) abnormal waste (reactor filters).

Lawrence Berkeley - Work for state and local governments and non-profit organizations such as seismic monitoring techniques for the State Lands Commission biological research at the Drosophila Center for National Institutes of Health and various services for universities.

Lawrence Livermore - Miscellaneous services performed for state and local governments such as earthquake analysis for the State of California and Livermore Manufacturing Outreach Center.

Oak Ridge - Miscellaneous services for state and local governments (including providing treated water to the City of Oak Ridge) and universities.

Oak Ridge National Lab - Miscellaneous services for state and local governments.

Office of Scientific and Technical Info - Operation of the Superconductivity Information System and the National Energy Software Center, both of which provide central depositories of these valuable Departmental resources for use by DOE researchers, as well as outside users.

Richland - Miscellaneous services at Pacific Northwest Laboratory (PNL) and Kaiser Engineering.

Oakland - Particle physics collaboration with Japan and other development efforts at the Stanford Linear Accelerator Center (SLAC).

National Renewable Energy Laboratory - State and local government services.

IV. Explanation of Funding Changes FY 1996 to FY 1997:

The increase of $ 1,030,000 in Argonne is related to Collaborative Access Teams made up of Universities seeking access to DOE technology.

The increase of $ 512,000 in Brookhaven is related to increased activity at Pergamon Press.

The decrease of $ 50,000 in Chicago is related to declining activity at the New Brunswick Laboratory.

The increase of $ 4,381,000 in Lawrence Berkeley is related to increased biological research for the National Institutes of Health at the Drosophila Center.

The increase of $ 2,023,000 in Lawrence Livermore is related to increased electric vehicle projects for the State of California and Livermore Manufacturing Outreach Center.

The decrease of $ 1,084,000 in Oak Ridge Operations is related to transfer of work from this account to reimbursable accounts where participants provide advance funding.

The decrease of $ 570,000 in Oak Ridge National Lab is related to declining activity for universities.

The decrease of $ 532,000 in Richland is related to use of uncosted balances to finance activity in FY 1997. The program level is declining significantly due to the transfer of work to accounts where participants provide advance funding.

The decrease of $ 100,000 in Oakland budget authority is related to declining activity at SLAC.

The decrease of $ 100,000 in National Renewable Energy Laboratory budget authority is related to the use of uncosted balances to finance activity in FY 1997. The program activity level remains unchanged.

The decrease of $ 2,000,000 in Cooperative R&D Agreements is related to eliminating request for this program. The small business activity in CRADAs was generally limited to employee participation which does not require advance funding from Cost of Work for Others.

The increase of $ 11,269,000 in the adjustment is related to unobligated balances used to finance this account in FY 1996.

V. Explanation of Average FTE Costs:

This account has no federal Full Time Equivalents.

DEPARTMENTAL ADMINISTRATION
(Tabular dollars in thousands, Narrative dollars in whole dollars)

REVENUES ASSOCIATED WITH COST OF WORK FOR OTHERS

I. Mission Supporting Goals/Ongoing Responsibilities:

Associated Revenues represents the full-cost recovery offset to Cost of Work for Others, the program associated with providing products and services to our customers.

II. Funding Table:

Total, Revenues Associated	FY 1995	FY 1996	FY 1997	$ Change	% Change
Products Sold:					
Oakland	$ 0	$ 0	$ 0	$ 0	0
Savannah River	-3,500	-3,000	-3,000	0	0
Subtotal, Products Sold	-3,500	-3,000	-3,000	0	0
Services Performed:					
Albuquerque	-3,100	-3,100	-3,476	-376	-12.2%
Argonne	-50	-265	-1,300	-1,035	-390.6%
Brookhaven	-1,000	-1,413	-1,975	-562	-39.8%
Chicago	-100	-150	-100	+ 50	33.3%
Idaho	-1,327	-350	-350	0	0
Lawrence Berkeley	-5,212	-2,369	-6,310	-3,941	-166.7%
Lawrence Livermore	-514	-3,912	-6,000	-2,088	-53.4%
Oak Ridge	-4,248	-3,490	-2,690	+ 800	22.9%
Oak Ridge National Lab.	-2,780	-1,418	-867	+ 551	38.9%
Off. of Scientific and Tech. Info.	-1,158	-1,160	-1,160	0	0
Richland	-36	-537	-36	+ 501	93.3%
Oakland	-4,025	-2,500	-2,400	+ 100	4.0%
National Renewable Energy Lab.	-124	-124	-124	0	0
Cooperative R&D Agreements	-2,000	-2,000	0	+2,000	100%
Subtotal, Services Performed	-25,674	-22,788	-26,788	-4,000	-17.6%
Total, Assoc Revenues	$ -29,174	$ -25,788	$ -29,788	$ -4,000	-15.5%

III. **Performance Summary:**

The activities related to Revenues Associated with the Cost of Work for Others are described in the section above titled Cost of Work for Others.

IV. **Explanation of Funding Changes FY 1996 to FY 1997:**

The increase of $ 376,000 in Albuquerque is related to increased activity that will be financed by uncosted balances. Previous baseline activity is financed with new budget authority.

The increase of $ 1,035,000 in Argonne is related to Collaborative Access Teams made up of Universities seeking access to DOE technology.

The increase of $ 562,000 in Brookhaven is related to increased activity at Pergamon Press.

The decrease of $ 50,000 in Chicago is related to declining activity at Brunswick Laboratory.

The increase of $ 3,941,000 in Lawrence Berkeley is related to increased biological research at the Drisophila Center.

The increase of $ 2,088,000 in Lawrence Livermore is related to increased electrical vehicle projects and Livermore Manufacturing Outreach Center.

The decrease of $ 800,000 in Oak Ridge Operations is related to transfer of work from this account to reimbursable accounts where participants provide advance funding. The revenues decline less than obligations because of the use of uncosted balances.

The decrease of $ 551,000 in Oak Ridge National Laboratory is related to declining activity for Universities.

The decrease of $ 501,000 in Richland is related to revised estimates of requirements for this program. The work budgeted in the past did not materialize.

The decrease of $ 100,000 in Oakland is related to declining activity at SLAC.

The decrease of $ 2,000,000 in Cooperative R&D Agreements is related to eliminating request for this program. The small business activity in CRADAs was generally limited to employee participation which does not require advance funding from Cost of Work for Others.

MISCELLANEOUS REVENUES

I. Mission Supporting Goals/Ongoing Responsibilities:

Miscellaneous Revenues are received from the sale of by-products that have no cost associated with the Departmental Administration appropriation. These items are by-products of activities funded by other on-going departmental programs and are collected as miscellaneous revenues. Included in this estimate are revenues collected from the Reimbursable Work program for added factor and depreciation.

II. Funding Table:

Miscellaneous Revenues	FY 1995	FY 1996	FY 1997	$ Change	% Change
Albuquerque	$ -1,000	$ -1,000	$ -1,000	$ 0	0
Idaho	-15,400	-15,400	-25,473	-10,073	65.4%
Pittsburgh	-23,800	-23,800	-23 800	0	0
Added Factor & Deprec	-53,302	-53,302	-42,311	+10,991	20.6%
Oak Ridge USEC	-2,016	-2,016	-2,016	0	0
Other Revenues	-1,000	-1,000	-1,000	0	0
Subtotal, Misc Revenues	$-96,518	$-96,518	$-95,600	$ +918	1.0%

1825

III. Performance Summary:

FY 1995 Measurable Performance Activities:

Albuquerque - Lease of facilities (gas and electric) to utility company at the Los Alamos National Laboratory at Albuquerque Field Office.

Idaho - Costs incurred at the Idaho Chemical Processing Plant for handling and basin storage of spent fuel cores for the Department of Navy.

SERVICES PERFORMED:

Albuquerque - Miscellaneous services for state and local governments, such as, highly specialized computer and automation support at the Sandia and Los Alamos National Laboratories and sale of utilities (water) to the County of Los Alamos at the Los Alamos National Laboratory.

Argonne - Work for state and local governments such as the Advanced Software Development and Commercialization project with the State of Illinois.

Brookhaven - Publication of Pergamon Press and miscellaneous activities for state and local governments.

Chicago - Certified reference materials used by the Nuclear community at the New Brunswick Laboratory.

Idaho - Irradiation services and storage of Three Mile Island (TMI) abnormal waste (reactor filters).

Lawrence Berkeley - Work for state and local governments such as seismic monitoring techniques for the State Lands Commission and various services for universities.

Lawrence Livermore - Miscellaneous services performed for state and local governments such as earthquake analysis for the State of California.

Oak Ridge - Miscellaneous services for state and local governments (including providing treated water to the City of Oak Ridge) and universities.

Oak Ridge National Lab - Miscellaneous services for state and local governments.

Office of Scientific and Technical Info - Operation of the Superconductivity Information System and the National Energy Software Center, both of which provide central depositories of these valuable Departmental resources for use by DOE researchers, as well as outside users.

Richland - Miscellaneous services at Pacific Northwest Laboratory (PNL) and Kaiser Engineering.

Oakland - Particle physics collaboration with Japan and other development efforts at the Stanford Linear Accelerator Center (SLAC).

NREL - State and local government services.

FY 1996 Measurable Performance Activities:

Pittsburgh - The Department of the Navy reimburses Pittsburgh for the nuclear material burn-up while the core is in operation.

Added Factor and Depreciation - Added factor and depreciation charges collected from other federal agencies as well as non-federal entities for Reimbursable activity conducted by the Department in accordance with full-cost recovery policy.

Oak Ridge-USEC Lease Payments - Lease of facilities - including Gaseous Diffusion Plants at Oak Ridge and Portsmouth - by United States Enrichment Corporation to reimburse the Department.

Other Revenues - Estimate based on current rate of collections for various miscellaneous revenues collected at all the sites.

FY 1996 Measurable Performance Activities:

Albuquerque - Lease of facilities (gas and electric) to utility company at the Los Alamos National Laboratory at Albuquerque Field Office.

Idaho - Costs incurred at the Idaho Chemical Processing Plant for handling and basin storage of spent fuel cores for the Department of Navy.

Pittsburgh - The Department of the Navy reimburses Pittsburgh for the nuclear material burn-up while the core is in operation.

Added Factor and Depreciation - Added factor and depreciation charges collected from other federal agencies as well as non-federal entities for Reimbursable activity conducted by the Department in accordance with full-cost recovery policy.

Oak Ridge-USEC Lease Payments - Lease of facilities - including Gaseous Diffusion Plants at Oak Ridge and Portsmouth - by United States Enrichment Corporation to reimburse the Department.

Other Revenues - Estimate based on current rate of collections for various miscellaneous revenues collected at all sites.

FY 1997 Measurable Performance Activities:

Albuquerque - Lease of facilities (gas and electric) to utility company at the Los Alamos National Laboratory at Albuquerque Field Office.

Idaho - Costs incurred at the Idaho Chemical Processing Plant for handling and basin storage of spent fuel cores for the Department of Navy.

Pittsburgh - The Department of the Navy reimburses Pittsburgh for the nuclear material burn-up while the core is in operation.

Added Factor and Depreciation - Added factor and depreciation charges collected from other federal agencies as well as non-federal entities for Reimbursable activity conducted by the Department in accordance with full-cost recovery policy.

Oak Ridge-USEC Lease Payments - Lease of facilities - including Gaseous Diffusion Plants at Oak Ridge and Portsmouth - by United States Enrichment Corporation to reimburse the Department.

Other Revenues - Estimate based on current rate of collections for various miscellaneous revenues collected at all the sites.

IV. **Explanation of Funding Changes FY 1996 to FY 1997:**

The increase of $10,073,000 in Idaho is related to Navy Cores representing a larger share of the stored material due to reduced shipments into the State of Idaho.

The decrease of $10,991,000 in Added Factor and Depreciation is related to the decline of defense related work for others at Nevada and Albuquerque.

EXECUTIVE SUMMARY

ENVIRONMENTAL MANAGEMENT
FY 1997 BUDGET REQUEST

The FY 1997 Environmental Management (EM) budget request is $5.878 billion. In addition, $182 million for EM privatization projects has been requested in the FY 1997 President's Budget as part of the general provisions. This request is part of an ongoing effort to improve planning and budgeting for acquisition of fixed assets and similar procurements. The EM FY 1997 budget request supports a wide variety of activities in addition to environmental restoration (i.e., cleanup) such as waste management functions, technology development efforts, plutonium stabilization, deactivation of surplus facilities and materials stabilization, nuclear non-proliferation support, a new environmental science program, privatization efforts, and various other essential EM efforts. Although environmental responsibilities continue to grow (i.e., transfer of the Savannah River, Mound and Pinellas sites from Defense Programs in FY 1996), budget growth has been curtailed. Considering the current fiscal environment, EM must grapple with long-term strategies to address projected work as the Department downsizes its production facilities and transfers the surplus facilities to EM. The fiscal pressure to hold down discretionary Federal spending points to a near-term budgetary crisis, with projected requirements far exceeding projected budgetary resources. EM has been working diligently to consider stakeholder views on the fundamental aspects of the program, including such issues as regulatory framework, total cost of meeting legal commitments, analysis of risk across the complex, pace of the environmental restoration, etc.

Declining budgets have forced EM to rethink how to accomplish the required work scope. The new EM strategy provides greater flexibility at the site level to direct resources to the activities that reduce threats to worker and public health and safety and imminent harm to the environment. The new strategy also explores non-traditional methods of competing and contracting major pieces of workscope, generally referred to as privatization, to reduce the cost to the taxpayer. EM is proposing legislation for privatization of facility deactivation, which will authorize contractor financing of deactivation projects, with the contractor being paid from savings in maintenance costs to the government. This could greatly reduce the outyear maintenance mortgage for our facilities, now approximately $600 million/year, by enabling earlier facility deactivation than would be possible based on budgetary constraints. Site managers will engage the State governments, regulators, and public stakeholders in good faith negotiations to maximize risk reduction per dollar spent. This process of stakeholder involvement has taken place during the formulation of the FY 1997 budget request. Funding flexibility, new funding strategies, and better coordination of site priorities between the Department and local interests will help EM accommodate the coming fiscal challenges.

From FY 1990 to FY 1994, the EM budget increased at a pace necessary to meet the growing requirements for transferred responsibilities from shutdown Defense production activities and to begin the immense cleanup job at these contaminated sites. The EM budget has since leveled off, although requirements are still being added to the programs. When comparing FY 1995 funding levels to the FY 1997 request, it would appear that EM has realized an approximate $69 million increase; however, on a comparable basis (considering scope transfers from other Departmental organizations), EM's budget declines by approximately $400 million. This is mostly a result of the absorption of hundreds of millions of dollars of costs associated with additional surplus facilities (e.g., Savannah River, Mound & Pinellas) transferred to EM in FY 1996.

OK 3/15/96

1837

Program Goals

The Environmental Management program has established six strategic goals to guide its efforts and serve as yardsticks for measuring progress. The EM FY 1997 budget request reflects significant changes in order to meet these program goals. The six goals are:

- to eliminate and manage urgent risks in our system;
- to emphasize health and safety for workers and the public;
- to establish a system that is managerially and financially in control;
- to demonstrate tangible results;
- to focus technology development efforts on identifying and overcoming obstacles to progress; and,
- to establish a stronger partnership between the Department and its stakeholders.

New Formats

Consistent with other government-wide streamlining initiatives, the EM program is presenting the FY 1997 Congressional budget request in a new format which summarizes and presents the various EM program activities in a more concise and easier to understand fashion. For each major EM line program, site accomplishments for FY 1995, and planned accomplishments for FY 1996 and FY 1997 are summarized by operations office in bullet format. This is a departure from the previous side-by-side fiscal year justifications which presented program efforts at lower levels of detail. These program efforts were at times overly technical, and did not adequately present the program's performance, outputs, or accomplishments.

The FY 1997 budget request has also been prepared on a comparable basis. This means that regardless of where activities were budgeted and funding was appropriated in previous years, the FY 1995 and FY 1996 funding and activity descriptions are reflected in the program that is requesting the funding in FY 1997. This includes internal EM transfers between programs, activities transferred out of EM, and new activities transferred into EM from other Departmental organizations (i.e., Defense Programs, Nuclear Energy, etc.) This will assist the reader when comparing activities from fiscal year to fiscal year. FY 1995 and FY 1996 comparability tables have been included in the Crosscuts Section of this summary to identify the internal shifts between EM programs, as well as Departmental transfers into and out of EM.

Operating Expense Funding

In FY 1996, Congress eliminated capital equipment and general plant project (GPP) funding categories, merging them with operating expenses. This was done in an effort to provide greater flexibility to the EM programs in managing capital equipment and GPP needs. The FY 1997 request is consistent with this approach.

1998

Summary of the FY 1997 EM Budget Request

EM programs are funded under three appropriation accounts -- Defense Environmental Restoration and Waste Management; Energy Supply, Research and Development; and the Uranium Enrichment Decontamination and Decommissioning (D&D) Fund.

FY 1997 Budget Request

(Dollars in Thousands)

Program	Defense	Energy Supply	D&D Fund	TOTAL	% of Total

EM Is Much More Than Cleanup

The industrial infrastructure used for producing and maintaining our nations nuclear weapons deterrent is massive. Factories, laboratories, and thousands of square miles of land were devoted to the successful enterprise of producing tens of thousands of nuclear weapons in the name of national security. It is important to understand, however, that this massive infrastructure still exists and is largely maintained and decommissioned by the EM program, which is sometimes loosely referred to as the "cleanup program." The nuclear weapons complex generated waste, pollution, and contamination which pose unique problems, including unprecedented volumes of contaminated soil and water, radiological hazards from special nuclear material, and a vast number of contaminated structures. The EM program has grown since its creation in 1989 in order to appropriately deal with the problems resulting from the nuclear weapons production era. Program activities in EM are much more than cleanup and include the following major efforts:

Privatization

- Provides funding to privatize a tank waste remediation system at the Hanford Site in Washington State. The funds are budgeted to allow the Department to reimburse contractors in the event the Government incurs liabilities for termination of privatization contracts.

Waste Management

- Ongoing regulatory compliance activities to bring the DOE complex "up to code" with environment, safety and health requirements; this includes construction of facilities for waste treatment and disposal (i.e., Defense Waste Processing Facility [treatment]; Waste Isolation Pilot Plant [disposal]).
- The majority of Corrective Activities program projects have been completed and the few remaining tasks have been incorporated into Waste Management program.

Environmental Restoration

- Cleanup - which includes remedial action and decontamination/decommissioning of DOE facilities
- Risk - identify and reduce and/or eliminate risks associated with contaminated soils, groundwater, surface water, and buildings at DOE and designated private facilities.
- Site completions - emphasize site completions, while maximizing beneficial reuse of site lands and facilities.

Nuclear Material & Facility Stabilization

- Support the Nation's non-proliferation goals through receipt and management of foreign research reactor spent nuclear fuel.
- Stabilizing and safeguarding plutonium scraps and residues, including stabilizing plutonium currently in forms or locations posing possible threats to workers or the public.
- Provide interim storage and management of spent nuclear fuel until ultimate disposition.
- Surveillance and maintenance of fissile materials and Defense production facilities at EM sites (Idaho, Savannah River, and Hanford sites take up 1,775 square miles).

Technology Development

- Develop high-payoff technologies that can be applied to better manage DOE-generated waste and to cleanup the inventory of DOE contaminated sites faster, safer, and cheaper than current environmental cleanup technologies. In FY 1994, 24 technologies were made available for use and transfer to the private sector; and in FY 1995, 13 new technologies were implemented at waste cleanup sites.

1840

EM is Much More Than Cleanup (continued)

Environmental Science Program

- This program includes efforts to establish and conduct strategic basic research related to EM issues in concert with national laboratories and universities.
- Includes risk management and analysis activities to ensure that risk analysis is integrated into the decision making process.

Site Operations

- Serves as the focal point and champion for inter-office/field operations activities and responsibilities within the EM program, including serving as the advocate for the field at Headquarters.
- Policy direction for landlord planning and budgeting, including reducing site infrastructure costs and managing workforce restructuring.
- By focusing national attention on the Transportation Management Program and the Pollution Prevention Program, EM will be responsive to the General Accounting Office and others who have pushed for a national focus for EM programs that have impact across the DOE complex. (The Transportation Management program was previously requested as a separate decision unit.)

Policy and Management

- Provides funding to plan, direct and manage the Environmental Management program and provides for various crosscutting activities, such as a national educational development program; safety and health initiatives; public accountability efforts; and strategic planning activities.

Program Direction

- Provides salaries, benefits, travel, and contractual support for the Federal workforce (3,128 FTEs nationwide in FY 1997) who are responsible for the overall direction and operation of the Environmental Management program.

1841

FY 1997 Program Emphasis

The FY 1997 EM Budget Request has been formulated with emphasis on the following:

- Risk. In 1993, three urgent risks were identified that existed at several sites: high-level waste tanks at Hanford, unstable plutonium, and corroded spent nuclear fuel and targets. Each of these was deadly serious and could have resulted in a catastrophic accident or serious worker injury without focused attention. EM has succeeded in eliminating, or has taken the initial step toward elimination of each of these urgent risks. The FY 1997 budget request continues to aggressively address and minimize urgent and near-term risk to workers, public and the environment.

- Compliance. Effectively prioritize and sequence work covered by Federal and State agreements to incorporate relative risk and cost effectiveness.

- Mortgage Reduction. Expedite demolition work, waste shipments, and permanent storage efforts to reduce future costs associated with growing surveillance and maintenance and deactivation costs associated with maintaining buildings and facilities that are ready for demolition, and the high costs associated with temporarily storing and monitoring wastes that are ready for permanent disposal.

- Less Studies and More Cleanup. Increase efforts to identify sources, nature and extent of contamination to allow more accurate determination of relative risk, scope and cost of projects, and establish data needs/objectives before characterization to increase the cost effectiveness and efficiency of characterization/assessment efforts. Of the total funding amount included in the FY 1997 request for Environmental Restoration, cleanup activities account for 44%, assessment activities account for 13%, and the remaining 43% is made up of the Government Contribution to the Uranium Enrichment D&D Fund Deposit, Uranium/Thorium Reimbursement, Surveillance and Maintenance, Landlord, Rocky Flats Waste Operations and Site Stabilization efforts, Compliance Oversight, and program management activities.

- Site Completions. The Environmental Restoration program is focusing on tangible results by the acceleration of efforts which will enable completion of cleanup at a number of smaller contaminated sites throughout the country. Beneficial reuse of the site lands and facilities will be maximized. Completion of nine sites is planned for FY 1997, bringing the total number of sites completed, since the establishment of EM in 1989, to 65 sites of the total 137 EM sites.

- Environmental Science Program. The need to build a stronger scientific basis for Environmental Management program efforts has been established in a number of recent studies and reports. The Galvin Commission cited the most important reason behind the slow pace of assessment and cleanup of DOE waste sites as being the low quality of science and technology that is being applied in the field. Further, the Galvin Commission cited the need for long-term, basic research in disciplines related to environmental cleanup and adopting a science-based approach that includes supporting development of technologies and expertise. In response to the Galvin Commission Report, as well as other recent recommendations, the Office of Environmental Management (EM) has established an Environmental Science Program. This program, which was initiated in FY 1996 with a $50 million congressional appropriation add, will continue efforts in FY 1997 to establish and conduct strategic basic research in concert with national laboratories and universities.

- Waste Isolation Pilot Plant. The Waste Isolation Pilot Plant will continue working towards receipt of Contact-Handled Transuranic Waste in FY 1998. Critical actions in FY 1997 include submittal of the final compliance application to the Environmental Protection Agency, completion of the Final Safety Analysis Report for disposal operations, and issuance of the Final Environmental Impact Statement for the disposal phase.

FY 1997 EM Program Emphasis (continued)

- Defense Waste Processing Facility. During FY 1997, the DWPF at Savannah River will complete its transition from startup phase to operation. The full performance capacity of the DWPF is 400 canisters per year (80 percent of maximum capacity of 500 canisters per year). Experience gained during the operation of DWPF in FY 1996 will allow for a managed increase in canister production rate in FY 1997. Projected rates in FY 1997 are a range of 80 to 150 canisters. Over the next several years, the production rate should approach the 400 canisters per year rate based on experience gained in FY 1996, FY 1997 and FY 1998.

- High-Level Waste Treatment Services. The Department will continue efforts to contract-out (privatize) treatment services for high-level waste at the Hanford Site in the State of Washington. The Department is attempting to reduce the cost of treating high-level waste contained in 177 tanks at the Hanford site by allowing free-market forces to compete with one another to set a "reasonable" price for such a service. The FY 1997 budget will provide for essential procurement package preparation, planning, management, and a termination liability fund, should the Department cancel the procurement for its own convenience.

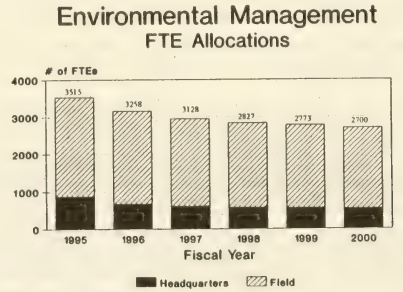
1843

Strategic Alignment

Consistent with the Department's strategic alignment initiatives, the EM program is reducing its Federal workforce at Headquarters (employees based in the Washington, DC area) and in the field (principally 10 major operations offices located throughout the United States). The FY 1997 budget request assumes a level of 3,128 FTEs in support of the Environmental Management program.

In FY 1995, the beginning Headquarters allocation was 870 (840 EM and 30 DP) full-time equivalents (FTEs) and actual usage was 741 FTEs. EM is planning to reduce its Headquarters allocation to 676 for FY 1996, to 618 in FY 1997. Staffing levels will continue to decline over fiscal years 1998 through 2000, leveling out at 498 FTEs. Over the five-year timeframe, Headquarters will experience a 40 percent reduction in FTEs.

The field ceiling for FY 1996 has been reduced from 3,112 FTEs to 2,582 FTEs, a decrease of 530 FTEs (17 percent). Field FTE levels for FY 1997 are again reduced to 2,510, a decrease of 72 FTEs (3 percent). Field FTE levels will continue to decline over fiscal years 1998 through 2000, leveling out at 2,161 FTEs. Over the five-year timeframe, the field will experience a 30 percent reduction in FTEs. The bulk of this decrease is the elimination of the additional 400 FTEs which the Office of Management and Budget granted EM for FY 1996 to complete the 3-year Pilot Program. These positions were never filled due to the Strategic Alignment Initiative.



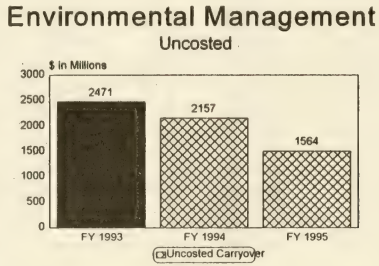
Per Strategic Alignment Initiative

1844

Reducing Prior Year Balances

Prior year uncosted obligations occur when funds are obligated on a contract, subcontract or purchase order, but the work has not yet been performed and the funds have not been costed or liquidated. These funds are commonly referred to as uncosted balances or carryover. The EM ending uncosted carryover balances have declined significantly over the past two years. At the end of FY 1993, EM's uncosted balances totaled $2,471 million, compared with an ending balance for FY 1994 of $2,157 million, a decrease of $314 million. The ending uncosted balance for FY 1995 was approximately $1,564 million, a reduction of nearly $600 million from the FY 1994 ending balance. Thus over the two-year period, uncosted balances for EM have been reduced by approximately one billion dollars. EM carryover balances at the end of FY 1995 were very close to established benchmarks now recognized by the General Accounting Office (GAO) as reasonable levels to carry over. At the end of FY 1995, EM uncosted balances (as a % of its budget) were the lowest of the five large programs within the Department (DP, EM, NE, ER, and FE).

EM is continuing to monitor its uncosted balances and to improve funds management to ensure that uncosted balances carried forward to the next fiscal year are as low as practical and tied to essential work scope/activities. This monitoring and analysis will ensure better utilization of resources and will enable EM to justifiably explain balances which exist at the end of each fiscal year. Unless procurement regulations are changed and requirements for up-front funding for capital equipment purchases and construction funding are altered, further significant reductions in uncosted carryover is unlikely.



1845

Reducing Prior Year Balances (continued)

A **preliminary** distribution of how the FY 1997 prior year balances offset will be allocated by site is shown below. EM will base the final distribution of the prior year balances offset on actual costing performance for fiscal year 1996. This is only an estimate to give the reader an approximate distribution. This is based on a preliminary estimate of $150.4 million of FY 1996 unobligated balances.

Field Office	Prior Year Balances Offset ($ 000s)
Albuquerque	($11,814)
Carlsbad Area Office	$0
Chicago	($3,890)

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
ENERGY SUPPLY RESEARCH AND DEVELOPMENT ACTIVITIES

PROPOSED APPROPRIATION LANGUAGE

For expenses of the Department of Energy activities including the purchase, construction and acquisition of plant and capital equipment and other expenses incidental thereto necessary for energy supply, research and development activities, and other activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101, et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion; purchase of passenger motor vehicles (not to exceed [25, of which 19 are] 24 for replacement only), [$2,727,407,000] $3,020,497, to remain available until expended.

EXPLANATION OF CHANGE

There are essentially no changes in the appropriation language other than the number of vehicles.

1860

ENVIRONMENTAL MANAGEMENT

PROGRAM MISSION

The Environmental Management (EM) program is responsible for identifying and reducing risks and managing waste at sites where the Department carried out nuclear energy or weapons research and production activities. These past efforts resulted in radioactive, hazardous, and mixed waste contamination which requires remediation, stabilization, or some other type of action. The EM program is budgeted under three appropriation accounts: Defense Environmental Restoration and Waste Management; Energy Supply, Research and Development; and Uranium Enrichment Decontamination and Decommissioning Fund. Under the Energy Supply, Research and Development account, the EM program includes waste management functions; environmental restoration activities; nuclear material and facility stabilization activities; and site operations efforts.

The **GOALS** of the EM program are:

- Eliminate and manage the urgent risk in the system;
- Emphasize health and safety for our workers and the public;
- Establish a system that increases managerial and financial control;
- Demonstrate tangible results;
- Focus technology development efforts on identifying and overcoming obstacles to progress; and,
- Establish a stronger partnership between the Department of Energy and its stakeholders.

To help achieve these goals, the EM program has made a commitment to performance measurement and to meeting the requirements of the Government Performance and Results Act of 1993. In response to this Act and in keeping with efforts to improve management practices, the Secretary of Energy has directed the Department to expeditiously adopt performance-based budgeting. The intent of performance-based budgeting is to show a direct relationship between program resources expended and results achieved. The EM program will continue to build on these efforts and focus its resources on meeting its goals.

When the EM program was established in late 1989, it inherited a legacy with significant environmental and political challenges. The 137 Environmental Management sites in 34 States have different functions, geographies, and degrees and types of contamination. The number of sites and facilities in the EM program continues to grow as the Department shifts its focus from primarily production efforts to environmental management activities. These sites include contaminated surface water or groundwater, soil, and structures currently totalling over 3,300 square miles of contaminated area. No other nation, government, or private entity has attempted a cleanup program of this scope and magnitude before.

PROGRAM MISSION, ENVIRONMENTAL MANAGEMENT, NON-DEFENSE (continued)

The EM program must comply with a significant number of legal requirements which result from 103 Departmental compliance agreements and a multitude of Federal, State, and local health and safety environmental statutes. Achieving a balance between requirements in existing agreements, risks associated with conditions at the various sites, and available resources will be a challenge requiring increased cost efficiency through better project performance and cost containment. The program's main challenge is to develop a strategy, within existing and projected technical and financial constraints, that enables the Department to meet its commitments to the American people.

MAJOR ACTIVITIES:

- Environmental Restoration: The objectives of the Environmental Restoration program are to stabilize radioactive waste, carry out remediation activities, or perform decontamination and decommissioning at contaminated DOE and legislatively-authorized non-government facilities and sites; to conduct assessments and characterization of DOE sites to determine if there is the potential for radioactive and hazardous waste releases; and to reduce and remove the potential risks to the environment and to human health and safety resulting from past non-defense Departmental activities.

- Waste Management: These activities are focused on safely, effectively, and efficiently managing the minimization, characterization, transportation, treatment, storage, and disposal of radioactive, hazardous, mixed, and sanitary wastes generated by past and ongoing operations at DOE facilities. These fundamental functions are necessary to safely and effectively manage waste which has resulted from the Department's major nuclear programs, and to prepare for new waste resulting from Environmental Restoration activities.

- Nuclear Material and Facility Stabilization: Coordinates and oversees the orderly transfer of surplus contaminated installations, facilities, and materials to EM, and plays a significant role in developing and implementing the policy and procedures for acceptance and disposition of these facilities. This program focuses on deactivation activities in a cost-effective and environmentally-sound manner to substantially decrease outyear surveillance and maintenance mortgages associated with currently contaminated facilities.

- Site Operations: Serves as the focal point and champion for crosscutting activities and responsibilities within the EM program, including serving as the advocate for the field at Headquarters. Policy direction for landlord planning and budgeting including reducing site infrastructure costs and managing workforce restructuring. The Pollution Prevention program provides for planning, coordinating and implementing a DOE-wide Pollution Prevention program.

ENVIRONMENTAL RESTORATION

PROGRAM MISSION

The mission of the Environmental Restoration (ER) program is to protect human health and the environment from risks posed by inactive and surplus Department of Energy (DOE) facilities and contaminated areas, by remediating and decontaminating and dismantling (D&D) sites, facilities and contaminated areas in the most cost-efficient and responsible manner possible in order to provide for future beneficial use. Program responsibilities include interim/remedial actions, D&D, compliance oversight, surveillance and maintenance (S&M) landlord functions and a prudent amount of program management activities. This budget request includes funds to carryout activities that must be undertaken immediately to minimize or prevent significant risk to workers, the public or the environment; activities required by current Federal, State and local regulatory agreements (in place or in negotiation); and support of other legal requirements, and DOE Orders.

The ER program currently manages activities in three appropriation accounts: EM Defense, EM Non-Defense, and Uranium Enrichment (UE) Decontamination and Decommissioning Fund appropriation. In total, the ER program includes over 600 Comprehensive Environmental Response, Compensation and Reliability Act (CERCLA) and Resource Conservation & Recovery Act (RCRA) projects, including 320 projects associated with sites on the Environmental Protection Agency's (EPA's) National Priorities List (NPL), 46 Formerly Utilized Sites Remedial Actions Project (FUSRAP) sites and 24 Uranium Mill Tailing Remedial Action Project (UMTRAP) sites, and more than 50 other projects. This budget area addresses the non-defense related areas of the CERCLA/RCRA projects in the ER inventory, all of the FUSRAP and UMTRAP sites, and a number of other site remediation efforts. For a more comprehensive/detailed explanation of ER activities, please refer to the ER Program Mission description for the Defense Environmental Restoration and Waste Management appropriation account. This section describes the overall ER mission and program efforts in more detail and includes graphic displays and performance measure information for the entire ER program.

The ER program faces the following challenges:

- Addressing and minimizing urgent and near-term risk to workers, the public and the environment.
- Maintaining a safe, productive, results oriented program.
- Effectively prioritizing and sequencing work covered by Federal and State agreements to incorporate relative risk.
- Demonstrating substantial progress to stakeholder/taxpayers.
- Maintaining the momentum of the program given the constrained budgetary climate facing all Federal Government programs.

PROGRAM MISSION - ENVIRONMENTAL RESTORATION - NON-DEFENSE (Continued)

To meet these challenges and fulfill its mission, the ER program has established eight goals. They are:

(1) Eliminate, reduce, or contain off-site contamination that may pose an adverse risk to the public and/or environment.
(2) Prevent migration of contaminants through timely identification, reporting, assessment, application of best technologies, and safe storage.
(3) Identify, decontaminate and/or control all sites and facilities formerly used by DOE and its contractors.
(4) Eliminate, reduce, or contain on-site contamination, that in future land use, may pose an adverse risk to the public and/or environment.
(5) Responsibly and cost effectively invest in activities, such as site safety, security, and utilities required to maintain the infrastructure to support the ER mission.
(6) Expeditiously cleanup and release facilities and land for public beneficial use
(7) Make prudent business decisions, such as funding activities that support and enhance the effective and efficient achievement of the ER mission.
(8) Increase efforts to identify sources, nature and extent of contamination to allow more accurate determination of relative risk, scope and cost of projects and establish data needs/objectives before characterization to increase the cost effectiveness and efficiency of characterization efforts.

The broad strategy of the ER program is to accelerate remediation completions at small sites, address the highest risks first at large sites, and complete decommissioning. Hence, the ER program has organized its sites and facilities into five categories, based upon site and facility similarities, to implement this strategy. These five categories are: UMTRAP and FUSRAP, Other Small Sites, Large Site Decommissioning, and Large Site Remedial Actions (RAs). The organization into these five categories allows for comparability of like sites and facilities, refinement of program focus and direction, and development of remediation strategies. Remediation efforts at EP sites and facilities, within each category are prioritized and sequenced based upon the eight goals discussed above. The definition and objectives of these categories are discussed below.

1865

<u>UMTRAP and FUSRAP Category</u>
UMTRAP and FUSRAP are separate programs which were initiated in the mid to late 70's, with some sites specifically added by Congress to FUSRAP and UMTRAP, separately authorized by Public Law 95-604 (as amended by P.L. 100-616). These remediation efforts maintain relatively short project durations, small project lifecycle costs and the scope is usually well defined. These sites may include associated vicinity properties which contain material from the main site. Site completion reduces total program costs by eliminating annual fixed costs.

The objectives of these two categories are to complete surface remediation of all 24 UMTRAP sites and vicinity properties by FY 1998; complete UMTRAP ground water activities by 2014; complete remediation of all 46 FUSRAP sites and vicinity properties by 2016; address immediate risk concerns and perform remediation consistent with stakeholder consensus and funding.

<u>Other Small Sites Category</u>
The Other Small Sites category includes those sites not included in FUSRAP or UMTRAP and have an estimate to complete of $150,000,000 or less. Completion of these sites best demonstrates tangible progress in ER to stakeholders, and site completions reduces total program costs by eliminating fixed costs. These sites also have relatively short project durations, small lifecycle costs and are well defined.

The objectives of this category are to reduce relative risk and demonstrate progress by completion of as many of these small sites as soon as possible, within the resources available in the non-defense appropriation account.

Large Site Decommissioning Category
This category includes all activities in the D&D program which are not included in the Other small sites category. D&D activities are typically lower priority, but hold the largest potential for reducing fixed infrastructure costs and, therefore, long-term mortgage.

The objectives of this category are to reduce long-term mortgage, address high risks, and maintain cost-effective funding level.

Large Site Remedial Actions (RA) Category
This category includes all activities in the remedial action (RA) program that are not included in any of the above categories. It is the largest segment of environmental restoration responsibility and includes sites with widely varied risk potential and possible large volumes of waste. These activities typically involve large projects driven by legal statutes and agreements.

The objectives of this category are to sequence work based on relevant attributes and maintain or reduce the current risk state at each site.

In response to the Department's commitment to improve management practices and to adopt performance based budgeting, the ER program tracks performance measures in four areas: 1) completed characterization/assessments; 2) completed interim and removal actions and expedited response actions; 3) completed RAs; and 4) completed final D&D projects. Characterization/Assessments are denoted by a completed key assessment document such as a Record of Decision (ROD), Corrective Measure Study (CMS), Closure Plan, D&D Plan, Proposed Plan, National Environmental Policy Act (NEPA) document, or No Action Decision. Interim and removal actions are any actions resulting in physical cleanup progress, reduction of exposure or contaminants or containment of a source term or any action to restrict access to contaminants. Final remedial actions include RCRA closures, RCRA final corrective measures, CERCLA final remedial actions and completed underground tank programs. D&D final actions are completed when D&D objectives have been met and a report has been submitted for approval. In addition, the program tracks the status of on-going projects in the four performance areas.

The ER program has aggressively pursued productivity savings and cost efficiency initiatives, with the objective to administer a program which delivers the "most bang for the buck." In particular, major efforts have been underway to increase the cost effectiveness and efficiency of characterization/assessment activities. In addition, much focus has been placed on the effective management of ER uncosted carryover balances to both reduce and optimize these balances using sound management practices. One initiative which EM is pursuing and from which ER can benefit is the "privatization of deactivation" initiative described on the first page of the EXECUTIVE SUMMARY. Savings from that initiative will be available for ER's decommissioning activities.

To provide maximum flexibility in addressing remediation efforts, all activities are budgeted under operating expenses and may include capital equipment-type and construction-type activities. This is consistent with the manner in which ER activities were budgeted and approved by Congress in previous years.

1869

PROGRAM MISSION - ENVIRONMENTAL RESTORATION - NON-DEFENSE (Continued)

Specific information relating to program diversity, performance measures, assessment versus cleanup trends and uncosted carryover trends for the ER program are presented in the ER "Defense" Program Mission statement mentioned previously. Please refer to these tables which are presented from a "National" ER perspective. That is, they combine and display all three appropriation accounts for the purpose of demonstrating how the entire ER program fits together. Non-defense specific tables can be found following the Program Performance Summary introductory paragraph for this section.

ENVIRONMENTAL RESTORATION

PROGRAM PERFORMANCE SUMMARY

The Environmental Restoration Non-Defense Program Performance Summary includes remedial action (RA) activities, decontamination and dismantlement (D&D) efforts, surveillance and maintenance (S&M), landlord, compliance oversight activities, and a prudent amount of program management and technical support activities necessary to maintain the effective management of overall program efforts. In addition, UMTRA Surface and Ground Water Projects and FUSRAP activities are included in this budget request. All operations/field office environmental restoration activities have been designated either a Major Systems Acquisition (MSA) or a Major Project (MP) by DOE and are administered in accordance with Departmental requirements for these major project designations. For additional details on schedules and other site-specific information, please refer to the various Operating Expense Funded Site Activity Descriptions included with this submission.

Tables follow (ND-1 through ND-3) which provide specific non-defense information relating to overall fiscal year funding, distribution of funds by category of effort, and budget trends by category.

(Dollars in Thousands)

ALBUQUERQUE

FACILITIES AND SITES

1. Mission Supporting Goals and Objectives

The ER Program, managed through the Albuquerque Operations Office, supports activities at four sites in the States of New Mexico (Los Alamos National Laboratory (LANL), Inhalation Toxicology Research Institute (ITRI), Colorado Grand Junction Projects Office GJPO), and Utah (Monticello millsite and vicinity properties).

ITRI, located in Albuquerque, conducts studies on the health effects of inhaling potentially hazardous airborne materials that might be found in industry, the environment, or the home. Major environmental restoration activities have focused on remediation of seven underground storage tanks and underground pipeline, along with 3,000 cubic yards of contaminated soil from the diesel oil release/spill area at the site, remediation of radioactive soil, concrete and metal structures from Hot Ponds and Sewage Lagoon sites. Initial assessment activity began in FY 1991, and remedial activity is planned to be completed by FY 1996.

The GJPO is located immediately south of the City of Grand Junction, Colorado, on a 56-acre site adjacent to the Gunnison River. GJPO supports the ER Program in the areas of site characterization, project integration and coordination, remedial design, remedial action, independent verification, D&D, assessment of technology needs, and geoscience and analytical chemistry.

Environmental restoration efforts at and around the Monticello, Utah sites include remedial action on a 10-acre inactive Government-owned uranium/vanadium mill processing site and the adjacent 300 acres of private and DOE-owned peripheral properties, assessment of surface and ground water contamination near Monticello, and RA of approximately 400 private properties (referred to as "Vicinity Properties") which have been contaminated by mill tailings from the Monticello millsite.

II. Funding Schedule - Albuquerque (Continued)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 24,285	$ 33,995	$ 34,065	$ 70	0
Decontamination & Dismantlement	3,208	3,300	5,050	1,750	+53
Long-term S&M	766	929	1,435	506	+54
Landlord	7,155	9,326	7,090	-2,236	-24
Compliance Oversight	93	150	150	0	0
Uranium Leasing	353	300	900	600	+200
Total, Albuquerque	$ 35,860	$ 48,000	$ 48,690	$ 690	+1

III. Performance Summary

FY 1995 Accomplishments

- Completed Hot Ponds Remediation (ITRI)
- Final Radiological Surveys completed on Hot Ponds (ITRI)
- Completed Final Risk Assessments on Hot Ponds (ITRI)
- Completed Lagoons excavation and received approval to ship to Envirocare (including Hot Ponds)
- The Citizens Advisory Board for ITRI held five meetings; CAB elected board officials in October.
- Provided potential responsible party (PRP) contribution for remediation of South Valley Superfund Site located in Albuquerque, New Mexico.
- Continued remediation of on-site contaminated material, and continued environmental monitoring for the GJPO Remedial Action Project (GJPORAP).
- Continued peripheral property remediation and completed final design for on-site repository for the Monticello Millsite Remedial Action Project.
- Performed environmental monitoring and implemented remedial investigation/feasibility study (RI/FS) work plan for the Monticello Surface and Ground Water Project.
- Completed designs for 11 properties and remediation of 81 properties for the Monticello Vicinity Properties Project.
- Inspected, monitored, and maintained Title I sites under the long-term S&M (LTSM) Program, and provide NEPA compliance for the Section 151(c) site.
- Performed routine and corrective maintenance and supported GJPO site management under the Landlord program.
- Continued to administer the Uranium Leasing Program.
- Performed independent verification for the GJPORAP and Monticello Projects.
- Completed site assessment for Oxnard, California facility.

ENVIRONMENTAL RESTORATION - NON-DEFENSE (Continued)

III. Performance Summary - Albuquerque (Continued)

FY 1996 Accomplishments (To Date and Planned)
- Complete cleanup at Oxnard, CA, site.
- Complete ITRI remediation; ship all waste.
- Provide the DOE PRP contribution for the remediation of the South Valley Superfund Site.
- Continue compliance activities required by three-party settlement agreements for the South Valley Superfund Site.
- Provide for overall program management support of Albuquerque Laboratory site activities.
- Complete on-site repository construction for the Monticello Mill Tailings.
- Complete 11 Vicinity Properties for the Monticello Remedial Action Program.
- Complete remedial actions on 6 buildings at the Grand Junction Project Office.

FY 1997 Planned Accomplishments

• Initiate tailings removal from the Monticello Mill Site	$ 26,569
• Prepare and submit draft RI/FS and interim ROD (sediment contamination) to EPA and state of Utah for Monticello Surface and Ground Water Project	1,133
• Continue remediation of designated vicinity and peripheral properties at Monticello	2,700
• Continue remediation of contamination at GJPO in Colorado	5,708
• Provide for GJPO Landlord, Long-Term Surveillance and Maintenance activities for closed sites, uranium leasing support, and other GJPO program activities	12,255
• Continue Program Management activities at ITRI	325
Total FY 1997, Albuquerque	$ 48,690

Explanation of Funding Changes FY 1996 to FY 1997:
- Efficiency in landlord activities at Grand Junction, resulting in increased D&D (+$690K)

Major Issues:
- None.

1878

ENVIRONMENTAL RESTORATION
(Dollars in Thousands)

ALBUQUERQUE / UMTRA-SURFACE

I. Mission Supporting Goals and Objectives

Public Law 95-604, "The Uranium Mill Tailings Radiation Control Action of 1978," authorizes the Department to conduct a mill tailings stabilization and control program at 24 former uranium ore processing sites that are contaminated with tailings and other byproducts of uranium mining and milling operations and an estimated 5,000 associated vicinity properties which became contaminated by windblown waste or debris used in construction or landscaping. The UMTRAP is managed through the Albuquerque Operations Office and supports efforts in eleven states (Arizona, Colorado, Idaho, New Mexico, North Dakota, Oregon, Pennsylvania, South Dakota, Texas, Utah, and Wyoming) and with two Indian tribes. RA has been completed for 15 of the 24 former uranium ore processing sites. UMTRAP is a cost-shared project with the Federal Government paying 90 percent of the RA cost and the States paying 10 percent. When the sites are on Indian lands, the Department pays the entire cost of the remedial action.

The Uranium Mill Tailings Remedial Action Amendments Act of 1988 (P.L. 100-616) extended the Department's authority to conduct RAs at the designated sites through the end of FY 1994. Additional legislation extended that date to the end of FY 1996. Due to increased scope of regulatory requirements and the identification of additional vicinity properties associated with the Grand Junction processing site, the Department has submitted a request for extension of the authorization to the end of FY 1998. For additional details on schedules and other site-specific information, please refer to the UMTRAP Operating Expense Site Activity Description Sheet included with this budget request submission.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 83,900	$ 65,946	$ 42,967	$ -22,979	-35
Total, UMTRA-Surface	$ 83,900	$ 65,946	$ 42,967	$ -22,979	-35

1879

ENVIRONMENTAL RESTORATION - NON-DEFENSE (Continued)

III. Performance Summary - Albuquerque / UMTRA-Surface (Continued)

FY 1995 Accomplishments
- Continued RA at Rifle, CO (2 sites) Gunnison, CO and Phase I of Naturita.
- Initiated RA at Maybell, CO and Slick Rock, CO (2 sites).
- Completed RA at Ambrosia Lake, NM and Mexican Hat, UT.
- Continued surveillance certification and licensing activities.
- Completed RA at 72 vicinity properties (VPs).

FY 1996 Accomplishments (To Date and Planned)
- Complete RA at Gunnison, CO and Rifle, CO (2 sites).
- Continue RA at Maybell, Naturita, and Slick Rock, CO (2 sites).
- Continue surveillance, certification and licensing activities.
- Complete RA at 67 VPs.

FY 1997 Planned Accomplishments

• Complete RA at Maybell, Naturita, and Slick Rock, CO (2 sites)	$ 9,173
• Continue operations and maintenance activities at Grand Junction	6,097
• Continue surveillance, certification and licensing activities	13,697
• Complete RA at 6 VPs	4,000
• Allow additional VPs to be completed and schedules to be accelerated against slips at Maybell, Slick Rock, and Naturita, CO (2 sites)	10,000
Total FY 1997, UMTRA-Surface	$ 42,967

Explanation of Funding Changes FY 1996 to FY 1997:
- Reduced funding is in accordance with completion of this activity in FY 1998. $-23.0M

Major Issues:
- The Department has officially requested a two-year extension of the UMTRA - Surface activity legislation to extend the program through the end of fiscal year 1998. This is currently with House Committee on Commerce and passage is expected this session.

1880

ENVIRONMENTAL RESTORATION
(Dollars in Thousands)

ALBUQUERQUE / UMTRA-GROUNDWATER

I. Mission Supporting Goals and Objectives

The UMTRA Ground Water Project will carryout additional characterization and compliance efforts, not covered by UMTRA-Surface, at 24 designated uranium mill tailings sites. Like UMTRA-Surface, the project was authorized by Public Law 95-604. Public Law 100-616 authorized an unlimited time period for conducting ground water compliance activities. The UMTRA Ground Water Project is managed through the Albuquerque Operations Office. Where RA activities are required for compliance, the Department will pay 90 percent of the costs; the States will pay 10 percent. When sites are on Indian lands, the Department is responsible for the entire cost of the compliance activity. For additional details on schedules and other site-specific information, please refer to the UMTRA Ground Water Project Operating Expense Site Activity Description Sheet included with this budget request submission.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 7,000	$ 7,800	$ 7,800	$ 0	0
Total, UMTRA Groundwater	$ 7,000	$ 7,800	$ 7,800	$ 0	0

III. Performance Summary

FY 1995 Accomplishments
- Draft Preliminary EIS (PEIS) completed.
- Conducted nine Public Hearings.
- Completed 16 Baseline Risk Assessments.
- Performed ground water monitoring at eight completed UMTRA Surface sites.
- Performed non-site specific activities including project management, project control, and facilities management.

FY 1996 Accomplishments (To Date and Planned)
- Final PEIS completed; published ROD.
- Complete Site Observational Work Plans (SOWP) for Canonsburg, PA, Grand Junction, CO, Rifle and Monument Valley, AZ.
- Complete SOWP at Ambrosia Lake, NM and Spook, WY and EAs at Spook, WY.
- Complete SOWPs for Falls City, TX , Riverton, WY, and Tuba City, AZ.
- Transition ground water project responsibility from Albuquerque Environmental Restoration Division to GJPO.

ENVIRONMENTAL RESTORATION - NON-DEFENSE (Continued)

III. Performance Summary - Albuquerque / UMTRA-Groundwater (Continued)

FY 1997 Planned Accomplishments	
• Complete RA plan for Ambrosia Lake, NM	$ 1,048
• Initiate SOWP at Green River, UT	516
• Continue SOWP at Canonsburg, PA; Durango, CO; Falls City, TX; Gunnison, CO; Grand Junction, CO; Lakeview, OR; Monument Valley, AZ; Rifle, CO (2 sites); Riverton, WY; Shiprock, NM; Tuba City, AZ; and Mexican Hat, UT.	6,236
Total FY 1997, UMTRA-Groundwater	$ 7,800

Explanation of Funding Changes FY 1996 to FY 1997:
- None.

Major Issues:
- None.

1882

CHICAGO

I. Mission Supporting Goals and Objectives

The ER program managed through the Chicago Operations Office supports activities at four sites in four states. These sites include ANL-E (Illinois), ANL-W (Idaho), Princeton Plasma Physics Laboratory (New Jersey), and BNL (New York).

The primary mission of the facilities under the Chicago Operations Office is research, development, and demonstration for DOE nuclear programs. This includes support of the nation's advanced reactor program and research on the fundamental properties of matter; physical, life, environmental sciences; magnetic confinement fusion and high-energy physics. By-products of this mission include transuranic waste, low-level waste, hazardous waste, and mixed waste (radioactive and hazardous combined). The Chicago Operations Office's facilities are aging, and many include former waste disposal sites that need to be assessed according to today's standards to determine the extent of environmental contamination.

The Chicago Operations Office manages, coordinates, tracks, and assists in the implementation of the environmental restoration program among the various sites. Other environmental restoration activities managed by Chicago include the management of AIPs with the State of New York. Major legal drivers include RCRA, CERCLA, State laws, and FFA's among DOE, EPA, and the State for BNL and ANL-W.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 17,293	$ 24,902	$ 27,753	$ +2,851	+11
Decontamination & Dismantlement	9,436	4,050	5,072	+1,022	+25
Long-Term S&M	34	34	30	-4	-12
Total, Chicago	$ 26,763	$ 28,986	$ 32,855	$ +3,869	+13

III. Performance Summary - Chicago (Continued)

FY 1995 Accomplishments

- Continued assessment activities required by FFA at BNL.
- Continued lime sludge removal and assessment activities; completed Map Tube and contaminated soil removal actions; and ground water barrier interim and began storage vault actions to assess and reduce risk and comply with RCRA at ANL-E.
- Continued Waste Area Group (WAG) 9 assessment to assess risk and comply with FFA at ANL-W.
- Continued assessment activities required by Memorandum of Understanding (MOU) at PPPL.
- Completed D-Tank removal action and continued removal actions for cesspools and groundwater project to reduce risk and comply with FFA at BNL.
- Completed D&D of the Experimental Boiling Water Reactor (EBWR), parts of the CP-5 Reactor, M-Wing Hot Cells, and decontamination and size reduction of 63 glove boxes at ANL-E to ensure worker safety and reduce environmental risk.
- Continued S&M to maintain contaminated facilities in a safe condition.
- Provided management, oversight, monitoring and technical support for all Chicago sites.

FY 1996 Accomplishments (To Date and Planned)

- Complete cesspool interim action, and cap on current landfill; continue interim action for ground water; begin capping former landfill drinking water hookups and removal of buried waste; and continue site-wide characterization activities to assess and reduce risk and comply with FFA at BNL.
- Complete assessment and begin design at the Central Steam Facility; continue assessment at the Sewage Treatment Plant and at the Waste Disposal Areas and Accidental Spill Sites; and begin assessment at the Graphite Research Reactor and Paint Shop/Old Firehouse to assess risk and comply with FFA at BNL.
- Continue lime sludge removal; complete storage vault interim action, sitewide closure of abandoned wells, and barrier to prevent contaminated ground water movement off site and continue assessment activities to assess and reduce risk, and comply with RCRA at ANL-E.
- Complete Burn Pit OU assessment and continue WAG 9 characterization to assess risk and comply with FFA at ANL-W.
- Continue characterization activities to assess risk and comply with MOU at PPPL.
- Complete transfer of 63 gloveboxes and M-Wing Hot Cell buildings to Landlord; continue D&D of the CP-5 Reactor and complete characterization of the Janus Reactor to reduce risk at ANL-E.
- Continue S&M to maintain contaminated facilities in a safe condition.
- Provide management, oversight, monitoring, and technical support for all Chicago sites.

FY 1997 Planned Accomplishments

- Complete construction for interim action for ground water project drinking water hookups, and capping former landfill; continue interim action for removal of buried waste; and continue site-wide characterization activities to assess and reduce risk and comply with FFA at BNL ..... $ 12,769
- Continue remedial design at the Central Steam Facility; complete assessment at the Sewage Treatment Plant and at the Waste Disposal Areas and Accidental Spill Sites; and continue assessment at the graphite Research Reactor and Paint Shop/Old Firehouse to assess risk and comply with FFA at BNL 7,231

1884

III. Performance Summary - Chicago (Continued)

FY 1997 Planned Accomplishments (Continued)

• Begin interim actions at two landfills and continue assessment activities to assess and reduce risk and comply with RCRA permit at ANL-E	3,107
• Begin and complete Industrial Waste System Removal and continue WAG 9 characterization to assess and reduce risk and comply with FFA at ANL-W.	1,718
• Complete characterization of Sites C&D and fund remediation of Sites A&B to assess and reduce risk and comply with MOU at a small site at PPPL	1,205
• Complete four D&D interim actions, complete final D&D of the Janus Reactor, and continue D&D of the CP-5 to reduce risk at ANL-E	5,069
• Provide management, oversight, monitoring, and technical support for all Chicago sites; provide for State oversight expenses; continue S&M to maintain contaminated facilities in a safe condition	1,756
Total FY 1997, Chicago	$ 32,855

Explanation of Funding Changes FY 1996 to FY 1997:

- Complete construction for interim action for groundwater project drinking water hookups at BNL.

Major Issues:

- None.

1885

OAKLAND

1. Mission Supporting Goals and Objectives

The ER Program managed through the Oakland Operations Office supports activities in the State of California at eight sites. These sites include Lawrence Berkeley National Laboratory (LBNL), Santa Susana Field Laboratory (SSFL)/Energy Technology Engineering Center (ETEC), General Electric Vallecitos Nuclear Center (GE), General Atomics (GA), Laboratory for Energy-Related Health Research (LEHR), Stanford Linear Accelerator Center (SLAC), the Geothermal Test Facility (GTF), and the Oakland Operations Office.

LBNL consists of a 130-acre facility and is located adjacent to the University of California in Berkeley. LBNL conducts a wide variety of energy-related research activities for the Department, including energy, environment, physics, transportation, computers, biology, and medicine. Past practices have left radioactive and hazardous contaminants in the soil and ground water. There have been 136 release sites identified at the LBNL site of which 104 have received a no further Investigation Status. ER activities at LBNL primarily focus on characterization and remediation of heavy metals and solvent-contaminated soil and ground water at the remaining 32 release sites and the RCRA closure of an existing Hazardous Waste Handling Facility (HWHF).

SSFL is a 2,700 acre site located in Simi Valley, California, and is owned and operated by Rockwell International (RI). Approximately 90 acres of the site has been furnished to the Department by Rockwell for the ETEC. ETEC has provided management, engineering, and project oversight on a wide range of Departmental programs involving the testing of nonradioactive components. Major environmental restoration focus will be on ground water assessments and cleanup, within Area IV; remediation of RCRA Facility Assessment identified Solid Waste Management Units (SWMUs); and cleanup of DOE-owned facilities located in Area IV. These facilities must be decontaminated for eventual release of the facility for unrestricted use.

The GE site is privately-owned and is located in Pleasanton, California. Environmental restoration activities will focus on cleanup of a High Level Hot Cell constructed in 1958 for post-irradiation examination of uranium fuel and irradiated reactor components and Glove Box Enclosure installed in 1968 for emission spectrograph analysis of uranium, both supporting primarily Government-funded nuclear programs.

The GA site is privately-owned and is located near San Diego. This site maintained and operated a hot cell facility for over 30 years, primarily to conduct Government-funded nuclear research and development. Environmental restoration efforts will primarily focus on cleanup of the Hot Cell Facility. Following cleanup, the facility will be released by NRC for unrestricted use.

The LEHR site is located at the University of California, Davis. Research at the laboratory originally focused on the health effects from chronic exposures to radionuclides using animal subjects to simulate radiation effects on humans. DOE terminated the research program and closed the laboratory in 1988. Environmental restoration activities focus on cleaning up DOE areas of site contamination for release to the University of California, Davis, without radiological restrictions.

ENVIRONMENTAL RESTORATION - NON-DEFENSE (Continued)

I. Mission Supporting Goals and Objectives - Oakland (Continued)

The SLAC, a 426-acre site managed under contract between the Department and Stanford University, conducts theoretical research in high-energy particle physics. Due to routine maintenance operations associated with the accelerator, certain hazardous waste streams have developed including waste oils, waste solvents, polychlorinated-biphenyl-contaminated (PCB) oils, aqueous metals, and wastewater treatment sludge. Environmental restoration efforts focus on cleanup of numerous PCB-contaminated soil sites and several solvent-contaminated ground water sites. Eight release sites have been identified at SLAC.

The Geothermal Test Facility (GTF) is an 82 acre site located 20 miles east of El Centro, California. The site was formerly used by the Department of Energy (DOE) to perform studies for geothermal power. The site lies on property owned by the Bureau of Land Management over which the DOE has a right-of-way agreement. The facility and cleanup responsibility is for the removal of approximately 1200 cubic yards of brine salts (arsenic contamination) from a one acre brine pond. A work order issued by the California RWQB requires remediation of the site by DOE.

The Oakland Operations Office manages, coordinates, tracks, and assists in the implementation of the ER Program among the multiple sites. In addition, the Oakland Operations Office manages and implements grants for the State of California oversight activities. Major legal drivers at Oakland sites include RCRA, Toxic Substances Control Act, California Porter-Cologne Act, and the Clean Water Act.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 10,741	$ 11,343	$ 10,503	$ -840	-7
Decontamination & Dismantlement	2,836	5,214	6,522	+1,308	+25
Total, Oakland	$ 13,577	$ 16,557	$ 17,025	$ 468	+3

III. Performance Summary

FY 1995 Accomplishments

- Continued CERCLA RI/Field activities at LEHR.
- Conducted Phase II RFI activities, completed Phase III RFI Work Plan and continued interim ground water treatment, initiated Phase I CMS, and conducted treatability studies for remediation of soil and ground water required by RCRA Permit at LBNL.
- Continued site-wide soil/surface water investigation field work and site-wide ground water investigations. Completed removal of PCB contaminated soils for the power supply and IR-6 drainage channel at SLAC.
- Completed Imhoff facility demolition, Cobalt-60 Facility and Tank Trailer D&D at LEHR.
- Issued project Statement of Work and received GE proposal. Contract negotiations initiated in late FY 1995.
- Completed independent verification of the former Sodium Disposal Facility and Buildings 064, 005 and 023 at SSFL.

III. Performance Summary

FY 1995 Accomplishments - Oakland (Continued)
- Continued D&D/S&M activities at Building 024 and Radioactive Materials Disposal Facility (RMDF), and ground water monitoring; completed decontamination of Building 012, and completed D&D of surplus moderator cask at ETEC.
- Completed site and facility characterization, completed final Environmental Assessment to D&D Hot Cell Facility, issued draft final D&D work plan to the State, shipped pre-D&D low-level and mixed LLW to Hanford, transferred irradiated fuel from the HCF to Building 30 (on site) for interim storage, and retained experienced staff at GA.
- Provided contractual project management support services to Oakland and payments for State grants.

FY 1996 Accomplishments (To Date and Planned)
- Complete Draft Corrective Measure Plan, and HWHF Work Plan; begin closure of HWHF; and continue interim water treatment, program management operations, data management, and sampling.
- Conduct required remedial investigations and ground water monitoring (Regional Water Quality Control Board Order), well inspection and maintenance, cursory review of ground water remedial alternatives, and provide for program management activities at SLAC.
- Continue ground water and environmental compliance monitoring, and complete site-wide soil radiation characterization report at ETEC.
- Initiate disposal of RI derived waste, prepare RI report and draft FS, prepare work plan and conduct readiness review and mobilization for Dog Pen Area and removal action, prepare final survey report for Cobalt 60 building at LEHR.
- Continue D&D/S&M activities at Building 024 and RMDF, initiate Large Leak Test Reactor D&D and continue D&D ongoing activities at SSFL.
- Complete Building 012 D&D final survey and independent verification and continue BO24 S&M at ETEC.
- Provide for required environmental, health and safety, S&M, and program management activities for the D&D of the GA Hot Cell Facility; continue to clean, decontaminate and ship D&D generated low level/mixed low level waste to Hanford.
- Provide required contractual project management for State grants.
- Initiate RWQCB required cleanup of GTF brine pond.
- Complete draft certification docket (from project closeout) for ETEC facilities 005, 023, 028, 029, 030, and 654.

FY 1997 Planned Accomplishments

• Continue interim actions for soil and ground water; continue HWHF closure, interim groundwater treatment; and perform program management at LBL	$ 3,676
• Conduct soil and ground water assessment activities and associated program management in accordance with small site initiative at SLAC	995

1888

III. Performance Summary - Oakland (Continued)

FY 1997 Planned Accomplishments (Continued)	
• Continue environmental monitoring, prepare RCRA CMS for B056 landfill cleanup, initiate operations of an enhanced system for removal of trichloroethylene/TCA from ground water, continue operation of interim ground water treatment system at ETEC	1,100
• Complete planning activities and long lead procurements for RMDF and initiate D&D: complete D&D of Large Leak Test Reactor (B059) and Liquid Metal Development Lab 2 (B057), and initiate removal of limited quantities of LLW from RMDF B022 (stakeholder concern) at ETEC	2,113
• Remove, transfer or dispose of 1300 Ci Co-60 source, continue environmental monitoring, continue CERCLA/NCP remediation of DOE Areas and dispose of restoration activity waste	4,380
• Continue minimally required S&M and begin minor characterization of Alpha Cell #4 and the glovebox enclosure at GE	105
• Continue D&D at the GA Hot Cell Facility and ship generated waste off-site under the SSI Program	3,600
• Complete Brine Pond removal action at the Geothermal Test Facility (GTF)	100
• Provide direct contractor support to the Oakland Operations Office for cost estimating, reporting, and technical review and provide funding for State of California for oversight activities	956
Total FY 1997, Oakland	$ 17,025

Explanation of Funding Changes FY 1996 to FY 1997:
- None.

Major Issues:
- None.

1889

OAK RIDGE

I. Mission Supporting Goals and Objectives

The ER Program managed through the Oak Ridge Operations Office consists of three sites in two states. These are Oak Ridge National Laboratory (ORNL) (Tennessee), Weldon Spring (Missouri), and the Oak Ridge Operations Office site (Tennessee).

ORNL is located on the Oak Ridge Reservation (ORR) which consists of three sites; K-25, Y-12, and ORNL. However, only ORNL is split-funded between the Defense and Non-Defense appropriations, based on prior year activity at these sites. The ORR covers approximately 37,000 acres of Oak Ridge, Tennessee and was placed on the NPL in 1989. During its 50 years of operation, portions of ORR have become contaminated with radioactive elements.

The Oak Ridge Operations Office manages, coordinates, tracks, and assists in the implementation of the ER program among the various sites.

ORNL is approximately 2,900 acres and is located about 10 miles southwest of Oak Ridge, Tennessee. ORNL is divided into 20 WAGs. The types of contamination include low-level radioactive material, organic solvents, corrosive wastes, PCBs, and heavy metals.

Weldon Spring is a surplus facility on the NPL to be remediated per NEPA/CERCLA requirements. The site in located in St. Charles County, Missouri, about 30 miles west of St. Louis, on land formerly used by the Department of the Army as a trinitrotoluene and initrotoluene ordnance works. The site consists of a nine-acre abandoned limestone quarry; a 51-acre raffinate disposal area; and a 169-acre uranium feed materials plant. This is a jointly-funded project with the Department of the Army.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 81,578	$ 83,497	$ 96,142	$ 12,645	+15
Compliance	0	892	0	-892	-100
Decontamination & Dismantlement	11,830	10,300	13,370	3,070	+30
Total, Oak Ridge	$ 93,408	$ 94,689	$ 109,512	$ 14,823	+16

1890

III. Performance Summary - Oak Ridge (Continued)

FY 1995 Accomplishments

- Completed two assessments, the Solid Waste Storage Area 4 Ground Water Seeps and the North and South Tank Farms Treatability Study, at ORNL.
- Completed three interim actions including WAG 1 Core Hole 8, Molten Salt Reactor Experiment (MSRE) isolation of auxiliary charcoal bed cell, and the MSRE purge and trap system at ORNL.
- Completed two remedial actions including WAG 6 Tumulus Pad Closure and WAG 6 Monitoring Stations construction.
- Conducted WAG 10 site characterization summary report at ORNL.
- Provided cross-cutting program management support at ORR.
- Continued operation of the Quarry and Site water treatment plants and continued construction of the Site water treatment plant train 2 at Weldon Spring Site.
- Completed Weldon Spring quarry bulk waste removal.
- Completed dismantling of Chemical Plant Buildings at the Weldon Spring Site.
- Continued efforts on the Quarry Residuals RI/FS and Ground Water RI/FS at the Weldon Spring Site.
- Completed construction and began operation of Chemical Stabilization/Solidification pilot facility at Weldon Spring Site.
- Continued operation of the Temporary Storage Area and the Material Staging Area at the Weldon Spring Site.
- Completed design for Chemical Plant building foundation removal at the Weldon Spring Site.
- Began detailed design for full scale Chemical Stabilization/Solidification (CSS) Facility, Weldon Spring Site.
- Started and completed Raffinate Pit Debris Characterization at the Weldon Spring Site.
- Continued to provide for environment, health, and safety activities at the Weldon Spring Site.
- Initiated construction of site drainage control facilities at the Weldon Spring Site.
- Completed design and initiated construction of contractor material staging area at the Weldon Spring Site.
- Began construction of soil borrow area for the Weldon Spring Site.

FY 1996 Accomplishments (To Date and Planned)

- Complete two assessments, action memorandums for WAG 5 Old Hydrofracture Tanks and MSRE Uranium Deposit removal at ORNL.
- Complete the MSRE off-gas system partitioning interim action at ORNL.
- Complete WAG 7 Pit 1 ISV remedial action at ORNL.
- Complete one D&D, the Waste Evaporator Facility Demolition, at ORNL.
- Complete ORNL WAG I Inactive Tank content removal.
- Provide cross-cutting program management support to the ORR.
- Complete construction of soil borrow area for the Weldon Spring Site.
- Begin removal of Chemical Plant building foundations at the Weldon Spring Site.
- Complete construction of site drainage control facilities at the Weldon Spring Site.
- Complete design of the full-scale CSS facility and purchase long lead equipment at the Weldon Spring Site.
- Complete design for construction and waste placement of the site disposal facility at the Weldon Spring Site.
- Complete construction of the contractor material staging area at the Weldon Spring Site.
- Complete construction of soil borrow area haul road at the Weldon Spring Site

III. Performance Summary - Oak Ridge (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

- Continue to provide for environment, safety, and health activities at the Weldon Spring Site.
- Continue operation of the Temporary Storage Area and Materials Staging Area at the Weldon Spring Site.
- Continue efforts on the Quarry Residuals RI/FS and ground water RI/FS at the Weldon Spring Site.
- Continue operation of the Quarry and Site water treatment plants at the Weldon Spring Site.
- Complete construction of the Site Water Treatment plant train 2 at the Weldon Spring Site.
- Complete consolidation of Raffinate Pit debris at the Weldon Spring Site.

FY 1997 Planned Accomplishments

• Conduct assessment and characterization activities for North and South Tank Farms, initiate Surface Impoundments Remedial Design, construction for inactive tanks and tank content removal, complete interim remedial action of WAG 4 seeps Alternative, and continue MSRE D&D	$ 35,900
• Provide cross-cutting support for Oak Ridge site-wide D&D programs	6,112
• Begin operation of soil borrow area at the Weldon Spring site	400
• Begin construction of full-scale CSS treatment facility at the Weldon Spring site	6,500
• Begin design for remediation of vicinity properties at the Weldon Spring site	1,800
• Complete removal of Chemical Plant Building foundations at the Weldon Spring site	5,100
• Continue operation of Temporary Storage Area and Material Staging Area at the Weldon Spring site	500
• Continue to provide required environmental, safety, and health activities at the Weldon Spring site	32,900
• Continue operation of the Quarry and Site Water treatment plants	4,100
• Continue efforts on the Quarry Residuals RI/FS and ground water RI/FS at the Weldon Spring site	1,500
• Begin construction of site disposal facility at the Weldon Spring Site	14,700
Total FY 1997, Oak Ridge	$ 109,512

Explanation of Funding Changes FY 1996 to FY 1997:

- Increased site wide remediation and building demolition at the Weldon Spring Site and D&D activities at the Molton Salt Reactor Experiment at ORNL. $+14.8M

Major Issues:

- None.

1892

ENVIRONMENTAL RESTORATION
(Dollars in Thousands)

OAK RIDGE / FUSRAP

I. Mission Supporting Goals and Objectives

The site identification and assessment program initiated by the Atomic Energy Commission in 1974, is being continued under the Formerly Utilized Sites Remedial Action Program (FUSRAP), to identify sites where radioactive contamination remains from early years of the Nation's atomic energy program. Following a determination that there is authority to conduct remedial action under the Atomic Energy Act of 1954, as amended, sites so identified are formally included for RA under the ER Program through FUSRAP.

FUSRAP, which currently includes 46 sites in 14 states, is managed through the Oak Ridge Operations Office. Program objectives are to identify, clean up, or otherwise control sites, that are DOE-owned or DOE-leased and at privately owned, where radioactive contamination remains from early years of the Nation's atomic energy program or from commercial operations that Congress authorized DOE to remedy. Of the 46 FUSRAP sites, 40 are Manhattan Engineering District or Atomic Energy Commission sites that are included in the Program. The other six sites were added by Congressional action in 1984 and 1985. Six of the FUSRAP sites are listed on the NPL. The 46 FUSRAP sites are grouped in four state groupings 1) Missouri, 2) New Jersey, 3) New York, and 4) Others. For additional details on schedules and other site-specific information, please refer to the FUSRAP Operating Expense Funded Data Sheet included with this budget request submission.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 74,100	$ 73,982	$ 83,079	$ 9,097	+12
Total, Oak Ridge FUSRAP	$ 74,100	$ 73,982	$ 83,079	$ 9,097	+12

III. Performance Summary

FY 1995 Accomplishments

- Continued ROD development for the Tonawanda, NY; the Wayne, NJ; the Maywood, NJ; and the St. Louis, Missouri sites.
- Completed Colonie, NY building decontamination and demolition (interim action).
- Completed Pile Removal (Phase B) at Maywood, NJ site (interim action).
- Initiated Middlesex Sampling Plant, NJ site EE/CA-EA.
- Completed building decontamination at Wayne, NJ site.
- Completed six residential vicinity property remedial actions at St. Louis, MO site.
- Performed interim remedial actions along haul roads at the St. Louis, MO site.
- Completed waste pile removal at two industrial vicinity properties at the St. Louis, MO site.

III. Performance Summary - Oak Ridge / FUSRAP (Continued)

FY 1995 Accomplishments (Continued)

- Mobilized for pile removal activities at the Wayne, NJ site.
- Issued final EE/CA for Pile Removal at Wayne.
- Started evaluation of treatment technologies for in-situ waste at FUSRAP sites.
- Continued S&M activities at Maywood, Wayne, Middlesex, and New Brunswick, NJ sites; St. Louis, MO sites; and Niagara Falls Storage Site, NY.
- Completed EE/CA at the Ventron, MA site.
- Completed Preliminary Remedial Action Report (PRAR) and certification docket for the Aliquippa Forge, PA site.
- Completed remedial action at six FUSRAP sites: the General Motors, MI; the Associate Aircraft, OH; the HHM Safe Co., OH; the Alba Craft, OH; the C.H. Schnoor, PA; and the Chapman Valve, MA sites.

FY 1996 Accomplishments (To Date and Planned)

- Initiate and complete Phase A pile removal at the Wayne, NJ site (interim action).
- Initiate pile removal (Phase C) at the Maywood, NJ site (interim action).
- Continue support of removal actions at St. Louis Downtown Site, MO.
- Initiate and complete decontamination activities on three buildings; demolish and dispose of one building at Linde, NY (Tonawanda Sites).
- Initiate pile removal activities at Linde, NY (Tonawanda sites).
- Begin preliminary scope and characterization for the B & T Metals, OH site.
- Write characterization plan and begin characterization at the Luckey, OH site.
- Complete the Preliminary Remedial Action Report (PRAR) and start certification docket preparation for the General Motors, MI site.
- Complete PRAR for the Associate Aircraft, OH; Alba Craft, OH; and C.H. Schnoor, PA sites.
- Complete characterization at Ashland 1 and Ashland 2, NY sites.
- Begin design at the Ventron, MA site.
- Provide for program support from ORNL, Institute of Science and Engineering, and ANL.
- Continue Middlesex, NJ site EE/CA-EA.
- Continue pile removal activities at Wayne, NJ site.
- Continue S&M activities at Maywood, Wayne, Middlesex, and New Brunswick, NJ sites; St. Louis, MO sites; and Niagara Falls Storage Site, NY.
- Complete remedial action at New Brunswick, NJ site.

1894

III. Performance Summary - Oak Ridge / FUSRAP (Continued)

FY 1997 Planned Accomplishments	
• Continue remedial action at Colonie, NY site	$ 22,256
• Complete remedial action of B&L Steel, NY site	2,420
• Complete certification packet for the Niagara Falls Storage Site (NFSS), NY site	823
• Complete Phase D pile removal at the Maywood, NJ site (Interim Action)	10,817
• Complete Phase B pile removal at the Wayne, NJ site (Interim Action)	6,080
• Initiate vicinity property remedial action at the Maywood, NJ sites (Interim Action)	5,998
• Continue environmental surveillance for Maywood, Wayne, Middlesex, and New Brunswick, NJ sites; the St. Louis, MO sites; and the NFSS, NY site	2,354
• Continue remedial action at Ventron, MA site	4,264
• Continue remedial action at the St. Louis, MO sites (Interim Action)	15,000
• Complete EE/CA and hazard assessment at the Shpack, MA site	185
• Initiate site characterization at the CE, CT site	3,673
• Complete characterization of the Luckey and Painesville, OH sites	4,692
• Continue Interim Action at Tonawanda Site (NY Sites)	4,517
Total FY 1997, FUSRAP	$ 83,079

Explanation of Funding Changes FY 1996 to FY 1997:
- Completion of remedial actions at NY and NJ sites; increased remedial actions at various sites. $+9.1M

Major Issues:
- None.

1895

ENVIRONMENTAL RESTORATION
(Dollars in Thousands)

OHIO

I. Mission Supporting Goals and Objectives

The ER Program, managed through the Ohio Operations Office, supports Battelle Columbus Laboratory (BCL) activities in the State of Ohio.

The BCL site is located in Columbus, Ohio. Research and development work was performed at its facilities for the Department and its predecessors. The buildings are privately owned by Battelle and the facility retains an active NRC license for possession of special nuclear material. Fifteen buildings, or portions thereof, are radioactively-contaminated.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	100	100	0	-100	-100
Decontamination & Dismantlement	$ 16,807	$ 11,568	$ 3,500	$ -8,068	-70
Total, Ohio	$ 16,907	$ 11,668	$ 3,500	$ -8,168	-70

III. Performance Summary

FY 1995 Accomplishments

- Completed D&D of Building KA-4; continued D&D of Building KA-5; and initiated D&D at KA-1 at BCL.
- Provided for low-level waste (LLW) shipments to an approved DOE site to reduce risk of further site contamination, and maintained waste minimization activities at BCL.

FY 1996 Accomplishments (To Date and Planned)

- Complete D&D of six buildings and return King Avenue property to private owner to maintain compliance with NRC license requirements and DOE contractual agreement at BCL.

ENVIRONMENTAL RESTORATION - NON-DEFENSE (Continued)

III. Performance Summary - Ohio (Continued)

FY 1997 Planned Accomplishments	
• Provide core S&M activities at the BCL West Jefferson facilities, to include: hazard control and stabilization, inspection and maintenance of facility systems and equipment, emergency call outs, industrial safety and industrial hygiene monitoring and oversight, and radiation monitoring and surveillance of the S&M work. In addition, compliance with NRC emergency preparedness regulation will be met with small scope drill exercises	3,000
• Provide Environmental Monitoring and Surveillance at the BCL West Jefferson site, to include: collection of required samples (air, water, soil, sediment, crops, etc.) from on-site and off-site locations to assure all discharges and releases are in compliance with regulatory requirements, calibration and maintenance of environmental radiation monitoring instrumentation, evaluation of data from lab analysis of samples, and record keeping an reporting functions	500
Total FY 1997, Ohio	$ 3,500

SAVANNAH RIVER

I. Mission Supporting Goals and Objectives

The site is located in south-central South Carolina and is bordered on the southwestern side by the Savannah River. The closest major population centers are Aiken, South Carolina and Augusta, Georgia. The ER Program is responsible for all aspects of assessment and remediation of facilities and sites that are no longer a part of active operations.

The Heavy Water Component Test Reactor (HWCTR) facility was deactivated in 1963. Ancillary building and equipment were removed in 1994. NEPA documentation, asbestos removal and D&D began in 1995. The deactivated reactor is currently scheduled for D&D surveillance and maintenance (S&M) activities and will continue until completion of the D&D.

Primary on-site contaminants include various nuclides (particularly plutonium, tritium, and uranium), volatile organic compounds, heavy metals, and solvents. Legal drivers for activities conducted at SRS include RCRA, CERCLA, and the site FFA (August, 1993) and various settlement agreements.

1998

HEADQUARTERS

I. Mission Supporting Goals and Objectives

Activities managed through Headquarters include the management, coordination, tracking, and implementation of the ER program among the multitude of sites through the DOE complex. These activities include technical support and cooperative agreements.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 34,589	$ 9,449	$ 8,511	$ -938	-10
Total, Headquarters	$ 34,589	$ 9,449	$ 8,511	$ -938	-10

III. Performance Summary

FY 1995 Accomplishments

- Provided technical support to ER in the areas of document review, program integration, and other crosscutting areas.
- Provided support to the Universities Robotics activities.
- Provided for Cooperative Agreement with National Academy of Sciences on Radioactive Waste Management.
- Provided support for the Residual Radioactive Code Development (RESRAD) activities.

FY 1996 Accomplishments (To Date and Planned)

- Provide technical support to the Office of Environmental Restoration in the area of document review, program integration, and other crosscutting areas.
- Provide for Cooperative Agreement with National Academy of Sciences on Radioactive Waste Management.
- Provide assistance on specific technical topics and programmatic assistance for performance and technical reviews.
- Provided support for the Residual Radioactive Code Development (RESRAD) activities.

1900

FY 1997 Planned Accomplishments - Headquarters (Continued)

• Provide technical support to the Office of Environmental Restoration in the areas of document review, program integration and other crosscutting areas	$ 4,011
• Provide technical support to Residual Radioactive Code Development (RESRAD) activities	500
• Support Cooperative Agreement with National Academy of Sciences on Radioactive Waste Management	2,000
• Provide assistance on specific technical topics and programmatic assistance for performance and technical reviews	2,000
Total FY 1997, Headquarters	$ 8,511

1004

1. Title and location of project:	Uranium Mill Tailings Remedial Action - Surface Project 24 Designated Sites	2a. Project No. N-1.4.4
		2b. Operating Expense Funded

8. Project Description, Justification and Scope

The UMTRA-Surface Project stabilizes and controls uranium mill tailings from 24 inactive processing sites and associated vicinity properties where tailings were used in the foundations of inhabited or commercial buildings or where tailings blew into open land surrounding the mill sites. The sand-like tailings are the result of uranium production from the early 1950s until the early 1970s. The UMTRA-Surface Project disposes of the tailings in a safe and environmentally-sound manner. Congressional authorization for surface tailings remediation expires in September 1996; however, legislation will be presented to Congress to extend the date to September 1998. The Uranium Mill Tailings Radiation Control Act (UMTRCA) of 1978 provides for the States to fund 10 percent of the remedial action costs at sites within the State (except on Indian lands), while the Department of Energy (DOE) Office of Environmental Management funds the remaining 90 percent. The DOE funds 100 percent of remedial action costs at sites on Indian lands.

Tailings remediation of each site includes a Remedial Action Plan (RAP) approved by the Nuclear Regulatory Commission (NRC) with the participation of the affected State/Tribe, an Environmental Assessment or Environmental Impact Statement, design/engineering, construction, prelicensing custodial care (PLCC), and licensing by the NRC. The hazards which these projects are designed to remediate include: (1) radon gas (Ra 222), (2) gamma radiation decay products (Pb 214 and Bi 214), (3) asbestos and other hazardous and mixed organic wastes at mill sites, and (4) Resource Conservation and Recovery Act (RCRA) listed constituents in ground water plus molybdenum, radium, uranium, selenium, and nitrates.

Belfield/Bowman, ND - ALUM 1325

This subproject involves the cleanup of approximately 158,000 cubic yards of contaminated material. Of the tailings to be handled, approximately 58,000 cubic yards will originate from the Belfield Site and be transported 70 miles for disposal at the Bowman Site. Concurrent with site remediation, nine vicinity properties will be remediated. National Environmental Policy Act (NEPA) documentation will be completed in FY 1996. Site and vicinity property remedial action will begin in FY 1996 and complete in early FY 1997. The Bowman site will be licensed by the NRC in FY 1998 and transferred to the Long-Term Surveillance and Maintenance (LTS&M) Program in FY 1998. The State of North Dakota has requested the site be removed from UMTRCA designation. Currently all work is suspended and funding removed from the DOE budget request

Grand Junction, CO - ALUM 1332

Previous TPC of $517,151,000 was reduced due to a reassessment of anticipated additional vicinity properties requiring remediation in the outyears, a decrease in the costs associated with the operations and maintenance of the Cheney disposal cell, lower negotiated costs for Department of Transportation/Occupational Safety and Health Act (OSHA) compliance and less material and final estimated material quantities for the Cheney disposal cell.

1995

1. Title and location of project:	Uranium Mill Tailings Remedial Action - Surface Project 24 Designated Sites	2a. Project No. N-1.4.4 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The processing site remedial action was 100% complete at this site with 4,653,826 cubic yards of contaminated material relocated to the Cheney disposal cell at the end of FY 1994. Radon barrier and rock cover, amounting to 264,580 cubic yards, was placed on the side slopes of the disposal cell through September 1994. Since the Cheney disposal cell will remain open until FY 1998 to accept anticipated additional contaminated material, an opening has been left to accept up to 500,000 cubic yards of tailings. Work was initiated at the commingled waste vicinity properties in late FY 1995 and will continue through FY 1997. Approximately 3,891 vicinity properties were completed by September 1995. Remediation of non-commingled waste vicinity properties will continue through FY 1998, with the direct transport of vicinity property tailings to the Cheney disposal cell completing in FY 1998; vicinity property reconstruction continuing through FY 1998; and the disposal cell completing in FY 1998. This assumes that the Project will be extended by Congress to accept additional vicinity property material beyond the end date of FY 1996. A Long-Term Radon Management Program is being considered which will allow a local and State government to manage and transport vicinity property material to the Cheney Cell. Under this Program, DOE would dispose of the material at the Cheney Disposal Cell.

Gunnison, CO - ALUM 1337

This subproject involves the cleanup of approximately 843,000 cubic yards of residual radioactive material (RRM) and other contaminants. The contaminated material will be relocated to a disposal cell in the vicinity of the County Landfill, approximately eight miles from the processing site. Concurrent with the remedial action at the processing site, 12 vicinity properties will be remediated. By September 1995 site remedial action was 99% complete. Site construction will be completed in early FY 1996 to include completion of corrosion protection material, site restoration, and demobilization. By the end of the first quarter of FY 1996, a total of 903,127 cubic yards of contaminated material will be encapsulated at the off-site disposal site, to be followed in FY 1996 by initiation of the completion report, long-term surveillance plan and PLCC. Leasing will be completed in FY 1997 with transfer to the LTS&M Program in FY 1998.

Maybell, CO - ALUM 1344

This subproject involves the cleanup of approximately 3.2 million cubic yards of contaminated material. Stabilization on site is the selected remediation option and 660,000 cubic yards of contaminated material will be moved for consolidation in the disposal cell at the processing site. Concurrent with remediation activities at the processing site vicinity properties will be remediated.

Site environmental documentation and the RAP were completed in FY 1995. The Project initiated and completed 40% of site remedial action and all six vicinity property remedial actions in FY 1995. In FY 1996, 90% of site remedial actions will be completed. Site construction will be completed in early FY 1997 and will include placement of 160,000 cubic yards of radon barrier material. The start and completion of site remedial action is one year earlier than it was for the FY 1995 Congressional Budget since re-evaluation of Project funding indicated that there would be sufficient funding in FY 1995 to begin construction, continue construction in FY 1996, and complete construction in early FY 1997.

1. Title and location of project:	Uranium Mill Tailings Remedial Action - Surface Project 24 Designated Sites	2a. Project No. N-1.4.4
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Naturita, CO - ALUM 1351

This subproject involves the cleanup of approximately 582,000 cubic yards of RRM. They will be relocated to the disposal site at Uravan, Colorado. Concurrent with site remedial action, 21 vicinity properties will be remediated. Once remediation is completed, activities will be initiated to certify and license the site. The previous TPC of $45,614,000 increased due to delays in determining the disposal location and increased costs of the Uravan Disposal Cell. In addition three new complex vicinity properties were added and others were reclassified resulting in additional costs for the vicinity properties. Site environmental documentation and the remedial action plan were also completed. Phase I (demolition) was completed, and Phase II initiated. In FY 1996, tailings haul will commence and be completed. Site construction will be completed in FY 1997 as well as the completion report, long-term surveillance plan, and PLCC. Site licensing will occur in FY 1998. No tailings were hauled in FY 1995; construction was limited to site preparation and county road upgrades.

Rifle, CO - ALUM 1354

This subproject involves the cleanup of approximately 4.1 million cubic yards of contaminated material at two sites, Old and New Rifle. The material will be relocated by truck to the disposal cell (Estes Gulch). Concurrent with remediation activities at the processing site, 96 vicinity properties will be remediated. Once remediation is complete, activities will be initiated to certify and license the site.

The site is currently undergoing remedial action and was 92% completed by the end of FY 1995. Approximately 4 million cubic yards had been relocated to Estates Gulch. Site remedial action will be 100% complete by the 3rd quarter of FY 1996. Activities in FY 1997 will include completion of the completion report, PLCC and the long-term surveillance plan. Site licensing will occur in FY 1998 and the site will be transferred to the LTS&M Program in FY 1998.

Slick Rock, CO - ALUM 1361

The previous TPC of $34,714,000 increased due to a change in the cell design which required additional rock excavation from the cell foundation.

This subproject involves cleanup of approximately 1.4 million cubic yards of contaminated material which will be relocated to a disposal cell in Burro Canyon, CO. Concurrent with remediation activities at the processing site, five vicinity properties will be remediated.

Site environmental documentation and the RAP were completed in FY 1995. Site and vicinity property remedial action were initiated, and site remedial action was 67% complete in FY 1995. In FY 1996, 35,200 cubic yards of radon barrier will be placed. The site construction will be complete by the first quarter of FY 1997. Remedial action completion will be followed by initiation of the completion report, long-term surveillance plan, and PLCC. The site will be licensed in FY 1998 and transferred to the LTS&M Program in FY 1998.

1. Title and location of project:	Uranium Mill Tailings Remedial Action - Surface Project 24 Designated Sites	2a. Project No. N-1.4.4 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

ALUM 1362, 1363, and 1364

In addition to the Grand Junction, CO processing site addressed previously, all remedial construction activities have been completed at the following UMTRA sites as of the end FY 1995: Ambrosia Lake, NM; Canonsburg, PA; Durango, CO; Falls City, TX; Green River, UT; Lakeview, OR; Lowman, ID; Mexican Hat, UT; Monument Valley, AZ; Ruriton, WY; Salt Lake City, UT; Shiprock, NM; Spook, WY; and Tuba City, AZ. Of these sites, the NRC has issued licenses through the end of FY 1994 for Spook, WY; Lowman, ID; and Burrell, PA, a major vicinity property associated with the Canonsburg site. These three sites have been transferred to the LTS&M Program. The NRC has also certified the Riverton, WY, site which completes all surface activities for this site. In addition, all vicinity property remedial action was completed at Edgemont and Dakota for which there are also no remaining activities.

In remediating these sites, approximately 25 million cubic yards of contaminated material were encapsulated in disposal cells on site or relocated and encapsulated in off-site disposal cells. Remaining activities for these sites for which budget is required include completion reports, pre-licensing custodial care, long-term surveillance plans, licensing activities, and transfer to the LTS&M Program.

This Project was created by UMTRCA (P.L. 95-604) which authorized the Secretary of Energy to clean up 24 designated inactive uranium mill tailings sites and approximately 5,000 associated vicinity properties. These sites and vicinity properties are to be remediated in a safe and environmentally sound manner to meet the Environmental Protection Agency (EPA) standards and to protect human health and the environment. The project coordinates with ten states and two Indian tribes to accomplish this goal. The UMTRA Amendments Act of 1988 (P.L. 100-616) extended the Department's authority to conduct remedial actions at these sites through the end of FY 1994. Additional legislation extended that date to the end of FY 1996. Due to increased scope of regulatory requirements, reduced budget levels, and the identification of additional vicinity properties associated with the Grand Junction processing site a request for extension of the authorization to the end of FY 1998 was submitted. Funding below the requested levels would delay site remedial action and cause the Project to extend past the proposed end of UMTRCA.

Detailed justification for those summary subprojects requiring funding in FY 1997 follows:

Remedial Actions:
This summary subproject is comprised of the activities to perform the cleanup of the sites as required by UMTRCA. This includes site characterization, preparation of conceptual design, preparation of the remedial action plan, processing/disposal site acquisition, and engineering and remedial action at the processing site, disposal site, and vicinity properties.

1908

1. Title and location of project:	Uranium Mill Tailings Remedial Action - Surface Project 24 Designated Sites	2a. Project No. N-1.4.4 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Program Management Support:
The activities included in this summary subproject are required to support the cleanup work being performed at the sites. This includes activities to support the NEPA process; certification of remedial action completion; licensing; technology development efforts; environmental, safety and health program; public information and participation; quality assurance audits; document control; site management; cost and schedules controls; budget development including ADS 50; performance measures; Baseline Environmental Management Report; Progress Tracking System; program management support; and management costs in support of DOE Headquarters.

Long-Term Surveillance:
This summary subproject is comprised of activities that must occur in order for the sites to be licensed, thereby satisfying the requirements of UMTRCA; and activities which result in the sites being transferred to the LTS&M Program. These include preparation and acceptance by the NRC of the long-term surveillance plan, which documents that the Federal Government has custody of the disposal site and describes in detail how the long-term care of these disposal sites will be carried out; pre-licensing custodial care of the disposal site to ensure that the integrity of the cell and surrounding area is maintained; environmental monitoring, and acceptance of the site under the general license issued by the NRC.

9. Method of Performance

The UMTRA Project Office has competitively awarded multi-year contracts for a Technical Assistance Contractor (TAC), Jacobs Engineering Group, Inc. (cost plus fixed fee contract); and a Remedial Action Contractor (RAC), MK-Ferguson Company (cost plus fixed fee contract), to support UMTRA Surface Project activities. The TAC is responsible for site characterization; NEPA documentation; conceptual design; technology development; technical and management support; and surveillance and maintenance planning following completion of remedial actions. The RAC performs engineering design; remedial action construction management; site health and safety; and quality assurance. Actual construction is performed by RAC-managed subcontractors. At the Salt Lake City, UT, site, pursuant to a mutual agreement between the Governor of Utah and the Secretary of DOE, the State of Utah was responsible for remedial action at the processing site and removal of tailings to Clive, UT. Additionally, the Department has awarded a multi-year contract to RUST-Geotech to provide RAC services for the Grand Junction, CO, and Edgemont, SD, vicinity properties. RUST-Geotech (cost plus award fee contract) performs engineering design, remedial action construction management, and quality assurance associated with the vicinity properties. In addition, it performs PLCC prior to licensing and transfer of each site to the long-term surveillance and maintenance program. Oak Ridge National Laboratory (cost reimbursable contract) is the inclusion survey/verification contractor and performs assessments of vicinity properties for inclusion, recommends remedial action if they exceed EPA standards, and verifies that remediated vicinity properties comply with the EPA standards.

1. Title and location of project:	Uranium Mill Tailings Remedial Action (UMTRA)-Ground Water Project 24 Designated Sites	2a. Project No. N-1.4.5
		2b. Operating Expense Funded

8. Project Description, Justification, and Scope

Ground water contaminated by previous milling processes at the Uranium Mill Tailings Remedial Action (UMTRA) Surface Project sites does not comply with the Environmental Protection Agency (EPA) ground water standards for UMTRA sites. Data,collected at the sites under the Surface Project will be supplemented with additional characterization to determine what further action will be required. Compliance strategies will then be selected for the sites not in compliance. Some sites will not require any action because they are already in compliance or because the ambient water quality is substandard. For all other sites, an appropriate strategy will be selected and implemented to achieve compliance with the standards.

The UMTRA-Ground Water Project Programmatic Environmental Impact Statement (PEIS) will be used as a decision-making document to determine the project-wide ground water compliance strategy. The programmatic approach proposed in the PEIS is an evaluation of specific conditions at each site and the selection of a compliance strategy for each site, that will ensure compliance with the appropriate EPA standards. These proposed compliance strategies reflect the variety of ground water conditions anticipated at the UMTRA sites and range from "no further action" to engineered remediations. The compliance strategy at each site will be developed in site-specific environmental assessments (EAs) which tier off from the programmatic framework defined in the PEIS. Site-specific compliance strategies will be identified for the 24 sites following publication of the Record of Decision (ROD), negotiation of Cooperative Agreements, and acceptance of the proposed compliance strategies by the affected states and tribes.

ADS ALUM 2000 Ground Water Remedial Action:

Previous TPC of $245,659,000 reduced primarily due to: 1) reduction in number of sites likely to require an alternate approach to the targeted ground water compliance; 2) removal of costs previously identified to pay for water rights at two Indian sites for which active compliance strategy is the targeted approach; and 3) a shift in the costs for developing the PEIS and National Environmental Policy Act (NEPA) documents from this subproject to subproject ADS ALUM 2023, Program Management Support.

This subproject provides for site characterization, to include preparation of baseline risk assessments and site observational work plans (SOWPs); conceptual designs to include preparation of the remedial action plans; property acquisition to include obtaining perpetual easements, monitor well agreements, and institutional controls; construction, operation, and monitoring of ground water remediation facilities; and long-term surveillance activities to include modification to the long-term surveillance plan, preparation of certification reports and second phase licensing of the sites by the Nuclear Regulatory Commission (NRC).

1.	Title and location of project:	Uranium Mill Tailings Remedial Action (UMTRA)-Ground Water Project 24 Designated Sites	2a. Project No. N-1.4.5 2b. Operating Expense Funded

8. Project Description, Justification, and Scope (continued)

ADS ALUM 2023 Ground Water Program Management Support:

Previous TPC of $288,305,000 increased due to addition of costs for fee payments to the NRC, additional project management costs and a shift in the costs for developing the PEIS and NEPA documents from subproject ADS ALUM 2000 Remedial Actions to this subproject. This subproject provides for developing and publishing the PEIS; preparing environmental assessments; technology development and transfer; technical, administrative and overall management of the project, to include administration of the environment, health, and safety, and quality assurance programs; operation of the cost and schedule control system; project reporting; records management; and budget development. In addition, this subproject provides for costs paid to the NRC for its support to the project as well as payments to the states and tribes for DOE's share of their costs.

The Uranium Mill Tailings Radiation Control Act (UMTRCA) of 1978 (P.L. 95-604) directed the Secretary of Energy to clean up 24 designated inactive uranium mill sites. Final EPA ground water standards require more strict compliance limits for ground water in plumes contaminated by milling processes at the UMTRA sites. The Uranium Mill Tailings Remedial Action Amendments Act of 1988 (P.L. 100-0616) authorized the Department to perform ground water remediation at these sites. The Department coordinates with 10 states and four Indian tribes to accomplish this remediation in order to protect public health and the environment. Although there is no time limitation, a delay in achieving compliance with the EPA standards means a continued threat to human health and the environment through consumptive use by plant and animal life. Detailed justification for those subprojects requiring funding in FY 1997 follows:

Remedial Actions: The purpose of this subproject is to comply with UMTRCA of 1978 (PL 95-604) as amended in 1988 by PL 100-616. The goal is to protect human health and the environment in a timely and cost-effective manner, using the most efficient compliance strategy for each site. This subproject supports the Remedial Actions subproject and provides for the preparation of the EAs and publication of the Findings of No Significant Impact (FONSIs), continued administrative and project management support, and NRC involvement in the project, so as to comply with EPA standards and generally satisfy the requirements stated in UMTRCA.

Type and Amount of work to be completed in the budget year (FY 1997):

- Complete EA for two sites, publish two FONSIs in the Federal Register, and complete one Remedial Action Plan (RAP).
- Initiate one EA, one SOWP, and two RAPs.
- Continue work on SOWPs at 11 sites and overall administrative and project management support.

1. Title and location of project:	Uranium Mill Tailings Remedial Action (UMTRA)-Ground Water Project 24 Designated Sites	2a. Project No. N-1.4.5
		2b. Operating Expense Funded

9. Method of Performance

The Grand Junction Project-Office, located in Grand Junction, Co. will be responsible for the acquisition of contractor services required in support of this project. A multi-year, competitively-selected contract (cost plus fixed fee) was awarded in 1991 to Jacobs Engineering Group for site characterization, feasibility studies, design, and technical and management support. A technical Assistance and Remediation Contract and Facilities operations and support contract are expected to be awarded July 1, 1996. These contractors will be responsible for construction, operations, and maintenance of required remediation facilities and program support respectively.

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-14) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 13,477	$ 7,023	$ 7,837	$ 7,862	$ 460,574	$ 496,773
2. Decontamination & Dismantlement	0	0	0	0	0	0
3. Long-term S&M	0	0	0	0	0	0
4. Landlord	0	0	0	0	0	0
5. Compliance Oversight	0	0	0	0	0	0
b. Contingency	0	0	0	0	0	0
Total (TPC)	$ 13,477	$ 7,023	$ 7,837	$ 7,862	$ 460,574	$ 496,773
Non-Federal Funding (States)	0	-23	-37	-62	-2,407	-2,529
NET Federal Total (TEC)	$ 13,477	$ 7,000	$ 7,800	$ 7,800	$ 458,167	$ 494,244

11. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

Project Description, Justification and Scope

Major non-defense projects at GJPO include the Monticello Remedial Action Project (MRAP), the Monticello Surface and Ground Water Remedial Action Project (MSG), the Monticello Vicinity Properties Project (MVP), the Long-Term Surveillance and Maintenance (LTSM) Program, the Grand Junction Projects Office Remedial Action Project (GJPORAP), Landlord Support, the Uranium Leasing Program, Oxnard Environmental Restoration, and several waste management projects.

1. Title and location of project:	Grand Junction Projects Office (GJPO) Grand Junction, Colorado	2a. Project No. N-1.4.6 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

MRAP includes remedial action on a 110-acre inactive Government-owned uranium/vanadium mill processing site (Operable Unit I) and the adjacent 300 acres of private and DOE-owned peripheral properties (Operable Unit II). MRAP activities include construction of a permanent, on-site repository into which approximately 2.6 million cubic yards of contaminated material will be placed. MSG (Operable Unit III) includes conducting a Remedial Investigation/ Feasibility Study (RI/FS) on the contaminated surface water and ground water system and down gradient from the MRAP millsite and contaminated sediment in Montezuma Creek Canyon. MVP includes remedial action of approximately 400 contaminated private properties.

The Oxnard Environmental Restoration Project includes site characterization and voluntary corrective actions to remediate as necessary the DOE facility in Oxnard, California.

GJPORAP includes detailed remedial action design, decontamination/removal of contaminated structures and soils, and environmental monitoring at the GJPO facility. Approximately 414,000 tons of radioactively contaminated materials have been removed from the facility.

LTSM provides program management and site custody, surveillance, environmental monitoring, and maintenance of licensed Title I and Title II disposal sites, the Section 151(c) site, and other sites (decontamination and dismantlement (D&D) and Formerly Utilized Sites Remedial Action Project (FUSRAP) sites) when transferred.

Uranium Leasing activities include mitigation of safety and environmental hazards identified on the inactive lease tracts; evaluation and approval of lessee mining plans and exploration activities; annual review and inspection of all active lease tracts restoration of withdrawn inactive lease tracts; and maintenance of four calibration facilities. GJPO landlord programs include Landlord support (facilities management and operation), Waste Management Operations, Waste Minimization, and construction of a facility to house mixed-waste treatment units and associated operations.

The scope of work to be accomplished at the budget authority level requested in FY 1997 is as follows:

MRAP: Continue remediation of millsite and peripheral properties by excavating mill tailings and contaminated soil and placing all contaminated materials into the permanent on-site repository. Provide funding for independent verification.

MSG: Continue RI/FS activities. Submit draft/final RI/FS. Draft Final Interim Proposed Plan and draft final Record of Decision (ROD) for sediments to Environmental Protection Agency (EPA) and the State of Utah.

1. Title and location of project:	Grand Junction Projects Office (GJPO) Grand Junction, Colorado	2a. Project No. N-1.4.6 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

MVP: Remediate Hall's Ditch and adjacent properties. Submit completion reports on 66 properties.

LTSM: S&M at 13 licensed Title I and 1 Title II permanent disposal sites, and the Section 151(c) site. Prepare Long-Term Surveillance Plans for 6 Title II sites.

GJPORAP: Continue D&D of contaminated buildings and perform environmental monitoring activities. Provide funding for independent verification.

Landlord: Continue basic services and provide for major maintenance. Provide for Waste Management Support Activities.

Uranium Leasing: Administer the program including the annual environmental inspections at 22 active lease tracts. Perform reclamation of eight uranium lease tracts, relinquished prior to FY 1996.

Remedial Actions: Remedial actions on MRAP, MSG, and MVP are required by a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Federal Facilities Agreement implemented between DOE, the EPA Region VIII, and the State of Utah. Other applicable or relevant and appropriate regulatory requirements are established in the RODs. After the Oxnard site is characterized, remediation will be governed by DOE environmental orders, National Environmental Policy Act (NEPA) regulations, Occupational Safety and Health Act (OSHA) and Toxic Substances Control Act (TSCA) requirements, and the State of California and county regulations, codes, and ordinances.

LTSM: The LTSM Program will be implemented for Title I and II sites in accordance with the requirements of the Uranium Mill Tailings Radiation Control Act (UMTRCA) of 1978, as amended, and the Nuclear Regulatory Commission (NRC) licenses for the sites. The NRC license and regulations 10-CFR-40 ensure that permanent disposal sites will be monitored and maintained to protect the future health and safety of the public. The regulations, 10CFR40.27, General License for Custody and Long-Term Care of Residual Radioactive Material Disposal Sites, took effect on November 30, 1990. The Nuclear Waste Policy Act Section 151(c) applies to the Parkersburg, West Virginia site. CERCLA and other regulations may apply to the D&D and FUSRAP sites.

1917

1. Title and location of project: Grand Junction Projects Office (GJPO)	2a. Project No. N-1.4.6
Grand Junction, Colorado	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

D&D: The intent of GJPORAP is to manage and dispose of on-site contaminated materials in conformance with applicable or relevant and appropriate regulatory requirements. GJPORAP is not a CERCLA site. However, CERCLA NEPA documentation was completed with the approval and issuance of the ROD on April 30, 1990. The Corps of Engineers 404 permit requires that the areas of the GJPO that were disturbed during removal of tailings be reconstructed and revegetated.

Landlord: Landlord support provides for compliance with DOE 4330.4B, Maintenance Management; DOE 4320.1B, Site Development Planning; partial compliance with DOE 4320.2, Capital Asset Management Process; Consolidated Facilities Management; 41-CFR-101, and Federal Property Management Regulations. Compliance with these orders provides for the management, planning, maintenance, and operations requirements of a Federal facility.

Waste Management operations must comply with the Federal Water Pollution Control Act, DOE Orders, OSHA requirements for hazardous waste operations and emergency response, Resource Conservation and Recovery Act requirements for hazardous and mixed waste (associated State of Colorado authorities granted by EPA), and TSCA requirements for management of regulated polychlorinated biphenyls. Waste Minimization activities are governed by DOE Orders for environmental protection and pollution prevention, Executive Orders for solid waste prevention and recycling, EPA toxic chemical release inventory requirements and other related regulatory requirements.

For Uranium Leasing annual inspections ensure compliance with environmental regulations (NEPA and the Clean Water Act) and identify safety or environmental hazards that exist on the tracts.

9. Method of Performance

Contracting arrangements are such that, to the extent possible, construction and procurement subcontracts shall be fixed price contracts awarded on the basis of competitive bidding.

8. Project Description, Justification and Scope

The Weldon Spring Site is a surplus facility on the Environmental Protection Agency's (EPA) National Priorities List to be remediated per National Environmental Policy Act (NEPA)/Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) requirements. The Weldon Spring Site is located in St. Charles County, Missouri, about 30 miles west of St. Louis, on land formerly used by the Department of the Army as a trinitrotoluene (TNT) and dinitrotoluene (DNT) ordnance works. The site consists of a 3.4 ha (9-acre) abandoned limestone quarry; a 21 ha (51-acre) raffinate disposal area; and a 69.6 ha (169-acre) uranium feed materials plant. This is a jointly funded project with the Department of Army. Work performed during the project will include environmental monitoring, environmental documentation, remedial design and remedial action. Training costs for DOE personnel, stakeholders, and other direct support contractors are paid from project funds. Training includes only that necessary to conform to regulatory requirements for access to and operation of this remedial action project. The Project Management Contractor schedules and coordinates all site specific training. In addition, various support facilities will be constructed utilizing operating funds. These facilities include:

Subproject 7301 - Project Integration:
Project integration provides project management, administration, environmental safety and health sampling/ monitoring, and implementation for WSSRAP in order to place the site in a radiologically/chemically safe condition in accordance with DOE guidelines. Specific tasks include:

- Conduct environmental safety/health programs as required to protect human health and the environment.
- Ensure remedial actions are conducted in accordance with applicable DOE guidelines; Federal, State, and local regulations; and consistent with any agreements reached between DOE, EPA Region VII, and the State of Missouri.
- Determine/implement the long-term disposition decision for radioactive/chemical waste and the site consistent with NEPA, CERCLA, Resource Conservation and Recovery Act (RCRA) and the Atomic Energy Act.
- Ensure all work is performed at minimum cost consistent with public health, safety, security, and environmental protection requirements.
- Provide maintenance/surveillance to protect the public and on-site workers.
- Record plans, procedures, costs, and other data to readily transfer knowledge/experience gained to other remedial action and future decommissioning projects.
- Perform planning/remedial activities in coordination with other DOE environmental restoration programs and in compliance with applicable quality/reliability objectives established by DOE.

1922

1. Title and location of project:	Weldon Spring Site Remedial Action Project (WSSRAP) St. Charles, Missouri	2a. Project No. ND-1.4.13
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Subproject 7302 -Technical Support Facilities:
Technical support Facilities provides all technical support associated with the Weldon Spring Site Remedial Action Project. These tasks include:

- Analytical laboratory/Environment, Safety and Health services
- Site surveys/maps
- Specialty labor such as drilling services
- Design, construction, and operation of buildings and facilities such as administration building, annex, laboratory, and composite building
- Design, construct, and maintain decontamination station
- Equipment/supplies for safe field operations including radiation/environmental/waste management/safety

Subproject 7303 - Quarry:
The Quarry is a nine acre site containing 126,630 cubic yards of radiologically contaminated soil/rubble and three million gallons of radiologically or chemically contaminated water.

A Record of Decision (ROD) for Quarry bulk waste removal was signed in March 1991 and the plan for remediation includes:
- Interim response action to treat Quarry contaminated water and discharge to the Missouri River
- Excavate Quarry bulk waste from the Quarry
- Transport Quarry bulk waste on a dedicated haul road to a Temporary Storage Area (TSA) at the site
- Treat Quarry TSA runoff at the Site Water Treatment Plant and discharge to the Missouri River.
- Restoration of the Quarry after remediation is complete.

Remedial action alternatives for Quarry residuals and ground water will be addressed during separate Remedial Investigation/Feasibility Study (RI/FS) processes.

1923

1. Title and location of project:	Weldon Spring Site Remedial Action Project (WSSRAP) St. Charles, Missouri	2a. Project No. ND-1.4.13
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Subproject 7304 - Raffinate Pits:
The Raffinate Pits consist of four waste lagoons, located within the Chemical Plant site. The contents of the lagoons consist of 407,930 cubic yards of Raffinate Sludges/Soil and 57 million gallons of radioactively- or chemically- contaminated water.

The Raffinate Pit tasks includes the remedial action and restoration of the four raffinate pits situated within the DOE property fence and the installation and operation of a sludge processing facility to prepare the raffinate wastes for permanent disposal. Specific activities include:

- Design, construction, and testing of a sludge processing facility pilot plant
- Title I/II design for raffinate pit waste removal and a sludge processing facility
- Installation/operation of sludge processing facility
- Excavation/removal of pond sludges/contaminated soil
- Transport of waste to sludge processing facility
- Decommissioning of sludge processing facility
- Restoration of raffinate pit site

Subproject 7305 - Chemical Plant:
The Chemical Plant site consists of 44 buildings and other structures along with 347,996 cubic yards of radiologically/chemically contaminated soil and building material. Within the site are the raffinate pits, the temporary storage area for Quarry bulk waste, and potentially a disposal facility after the buildings and foundations are removed.

The Chemical Plant tasks consists of all activities associated with remediation of Chemical Plant process buildings, support buildings, foundations, tanks, soils and utilities within the DOE property fence. Specific tasks include:

- Title I/II Design engineering
- Asbestos removal/decontamination of buildings, tanks, pressurized cylinders, containerized chemicals, foundations, equipment and soils
- Disposal of containerized chemicals
- Dismantling/demolition of buildings, equipment, foundations, underground pipes, and miscellaneous utilities
- Construct/operate Material Staging Area (MSA)
- Transport asbestos to Asbestos Containing MSA

1924

1. Title and location of project:	Weldon Spring Site Remedial Action Project (WSSRAP) St. Charles, Missouri	2a. Project No. ND-1.4.13
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

- Sort/transport wastes to MSA
- Construct surface water drainage control system
- Remove contaminated soils
- Restore Chemical Plant Site grounds
- Renovate/operate RCRA waste storage facility in compliance with RCRA/Toxic Substances Control Act

Subproject 7306 - Vicinity Properties:
The Vicinity Properties consist of several areas adjacent to DOE property and contain approximately 25,400 cubic yards of radiologically or chemically contaminated soil. The Vicinity Properties tasks consist of all activities associated with remediation and restoration of properties known as Femme Osage Slough, Southeast Drainage, Army properties, and Busch Wildlife properties located outside the DOE property fence. The properties are contaminated as a result of previous activities conducted at the Weldon Spring Site. Specific tasks include:

- Performing Title I/II Design engineering
- Removal of contaminated soils and transportation to appropriate disposal area
- Restoration of designated vicinity property

Subproject 7307 - Disposal Facility:
The ROD for the final disposition of the WSSRAP wastes was signed in September 1993. The final disposal alternative for the remediated wastes of the WSSRAP is outlined in the Disposal Facility tasks. The Disposal Facility tasks consists of the development, construction, and operation of a disposal cell facility located at the Chemical Plant site, site water treatment plant, and waste processing facility for permanent, on-site disposal for Quarry (ADS 7303), Raffinate Pit (ADS 7304), Chemical Plant (ADS 7305) and Vicinity Property (ADS 7306) site wastes. In addition, approximately 50,000 cubic yards of contaminated soil from an adjacent Department of the Army cleanup site will be placed in the disposal facility. Specific tasks include:

- Title I/II Design engineering
- Construction/operation of disposal facility
- Construction/operation of soil borrow area
- Construction/operation of water treatment plant facilities
- Construction/operation of waste processing facility
- Construction/operation of construction MSA
- Decommissioning facilities and restoration

1. Title and location of project:	Weldon Spring Site Remedial Action Project (WSSRAP) St. Charles, Missouri	2a. Project No. ND-1.4.13
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Subproject 7308 - Studies:

Before any remedial action may be started, the WSSRAP must complete the appropriate environmental compliance process. The studies tasks include radiological, chemical, and geotechnical investigations; characterization analyses; assessments and associated documentation to support the remedial action/restoration of WSSRAP. These remedial action/restoration activities will be performed in compliance with NEPA and CERCLA and other regulations as required. Specific tasks include:

- Generation/revision of RI/FS work plans
- Prepare RI/FS-Environmental Impact Statement (EIS) and supporting documentation for Quarry Bulk Waste removal
- Prepare RI/FS-EIS and supporting documentation for remedial action/disposal/restoration activities of Chemical Plant site
- Prepare integrated RI/FS-EIS and supporting documentation for the quarry residual/ground water operable unit (OU)
- Prepare RI/FS-EIS and supporting documentation for the site ground water OU
- Conduct RI and characterization activities
- Prepare RI reports
- Prepare risk assessments
- Support resolution of all public and government agency questions/comments
- Prepare special studies/reports to support remedial action/restoration of WSSRAP
- Prepare Conceptual Design Report
- Prepare/review all Engineering Evaluation/Cost Analyses
- Prepare/review all RODs

Subproject 7312 - Independent Validation/Verification:

DOE/EM directs a program under the Office of Environmental Restoration to evaluate hazardous material contamination at sites previously used by contractors of DOE or its predecessors (Manhattan Engineering District, Atomic Energy Commission (AEC), and Energy Research and Development Administration), and to implement remedial actions, where appropriate. It is the DOE practice to require independent verification of the adequacy of such remedial actions at Weldon Spring site and reports findings to DOE. In addition, Oak Ridge Institute for Science and Education (ORISE) serves as the archival site for environmental samples and the supporting records. ORISE also provides technical assistance to DOE/EM on topics related to radiological and hazardous material contamination control, monitoring, and guidelines. This includes the review of documents related to specific sites and DOE guidance reports.

1926

1. Title and location of project:	Weldon Spring Site Remedial Action Project (WSSRAP) St. Charles, Missouri	2a. Project No. ND-1.4.13
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Verification of ongoing remedial action activities will continue as assigned. The need for verification activities is expected to increase during the FY 1995-FY 1998 timeframe, as the planning process is concluded and remedial action increases.

WSSRAP is listed on the NPL and the purpose of the project is to remediate the Weldon Spring Quarry, Raffinate Pits, Chemical Plant, and Vicinity Properties, and provide for long-term management of the wastes in a safe and environmentally sound manner.

Justification:
The feed materials plant was built during 1955-1957 by the AEC, predecessor agency to DOE, and operated by Mallinckrodt Inc. for the AEC from 1957 to 1966. During operations of the plant, the buildings, equipment, immediate terrain, process sewer system, vicinity properties, and drainage easement to the Missouri River became contaminated with uranium, thorium, and their decay products.

During the period 1943-1957, DA utilized the Weldon Spring Quarry for disposal of rubble and soils contaminated with TNT and DNT, and AEC disposed of building rubble and soils contaminated with thorium, uranium, and decay products during its operations at the site. The Weldon Spring Quarry contains a total of 126,630 cubic yards (225,770 tons) of wastes, including materials contaminated by the radioactive wastes.

In 1967, the feed materials plant site was selected for a herbicide production facility and, except for the materials stored in the Weldon Spring Raffinate Pits (WSRP), the site was transferred back to the DA and renamed the Weldon Spring Chemical Plant (WSCP). The DA began a major effort to decontaminate three process buildings for herbicide production. The cleanup was not totally successful, and subsequently, reduced requirements for the herbicide and increased cleanup costs resulted in project cancellation in 1969. Approximately 347,996 cubic yards (448,804 tons) of contaminated soil, equipment, and building rubble remaining on the WSCP site requires cleanup to meet current guidelines for unrestricted use.

The 51 acres encompassing the WSRP site were transferred back to the AEC (now DOE) in 1971. The WSRP contain approximately 254,430 cubic yards (268,630 tons) of residues. In addition, it is estimated that 153,500 cubic yards (233,320 tons) of soils/sediments beneath the pits was contaminated by these radioactive wastes.

The sites have been in care and custody status since activities ceased in 1969. In June 1975, environmental and radiological surveys were initiated. Preliminary analyses showed that the site cannot be released for unrestricted use without radiological decontamination. Trace levels of TNT and DNT residues are present throughout the area; however, no explosive hazard exists. Also, a preliminary estimate indicates approximately 25,400 cubic yards of contaminated materials on nearby associated vicinity properties may require removal and disposal. Current monitoring shows continuing off-site migration of radionuclides, and other hazardous substances. Remedial actions are necessary to stabilize the wastes.

1997

1. Title and location of project:	Weldon Spring Site Remedial Action Project (WSSRAP) St. Charles, Missouri	2a. Project No. ND-1.4.13
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

In February 1987, DOE issued a draft EIS for remedial action at the Weldon Spring Site. This draft EIS and supporting documents was also intended to meet the CERCLA document requirements for an RI/FS. In June 1987, DOE determined that a revised draft EIS was needed based on significant new information on ground water contamination that became available after the draft EIS was issued. In December 1987, EPA requested that DOE prepare an RI/FS. DOE agreed to prepare an RI/FS and supplement it with any additional information needed for an EIS.

DOE and EPA have entered into a Federal Facility Agreement which establishes responsibilities, remedial action objectives and a schedule of milestones for completion of WSSRAP. This agreement was signed in January 1992. A ROD was signed by EPA and DOE in 1991 regarding the removal of bulk waste at the Quarry. A ROD was signed by EPA and DOE in 1993 regarding the final disposal of all waste at the WSSRAP.

Scope:
The WSSRAP has been designated as a DOE Major Systems Acquisition with the objective of remediating hazardous conditions at the Site.

The Scope of the WSSRAP includes:

(1) Maintenance and surveillance of the site as necessary to maintain public safety and reduce radiological impact to as low as reasonably achievable, in preparation for site disposition.
(2) Assumption of custody and accountability for the WSCP at the beginning of FY 1986 and integration of remedial actions at the WSCP with the WSRP, the WSQ, and the WSVP.
(3) Integrated planning, engineering, and technology development as necessary to support evaluation of long-range disposition alternatives.
(4) Completion of environmental documentation process as required under CERCLA/NEPA.
(5) Planning and implementing the remedial action program required to adequately clean up the site, including construction of a disposal cell for final waste disposal.
(6) Decontaminating the Weldon Spring Quarry to mitigate migration of radiological/chemical contaminants toward the well field which provides drinking water to more than 60,000 residents of St. Charles County.

9. Method of Performance

The Office of Environmental Management has been assigned programmatic responsibility for the project. The Oak Ridge Operations Office has been delegated day-to-day project management responsibility and has established a dedicated Project Office at the site.

1928

1. Title and location of project:	Weldon Spring Site Remedial Action Project (WSSRAP) St. Charles, Missouri	2a. Project No. ND-1.4.13
		2b. Operating Expense Funded

9. Method of Performance (continued)

The Project Office will provide technical, administrative, and financial management of the project. MK-Ferguson is the Project Management Contractor and is responsible for the final design and construction, surveillance and maintenance, and insuring completion of the project in accordance with DOE guidance. In implementing approved remedial actions, the Project Management Contractor (PMC) will utilize subcontractors from the Weldon Spring vicinity to the extent that it is cost-effective and programmatically expedient.

Argonne National Laboratory is the RI/FS-EIS preparation contractor. PAI Corporation is the support services contractor selected to assist DOE in the review of work performed by the PMC. The United Nuclear Corporation conducted the radiological characterization for the WSCP. Process technology studies in support of the RI are being performed by Oak Ridge National Laboratory and Pacific Northwest Laboratory. United States Geological Survey/Missouri Department of Natural Resource are assisting in the conduct of geohydrological investigation to support site characterizations.

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total

1931

1. Title and location of project:	Formerly Utilized Sites Remedial Action Project (FUSRAP) 46 Sites in 14 States	2a. Project No. N-1.4.11 2b. Operating Expense Funded

8. Project Description, Justification and Scope

Site Identification and Assessment: The site identification and assessment program initiated by the Atomic Energy Commission (AEC) in 1974, a predecessor of FUSRAP, is being continued under FUSRAP to identify sites where radioactive contamination remains from the early years of the nation's atomic energy program. Following a determination that there is authority to conduct remedial action under the Atomic Energy Act of 1954, as amended, sites so identified are formally included for remedial action under FUSRAP.

Remedial Action: FUSRAP currently includes 46 sites in 14 states. FUSRAP objectives are to identify, clean up, or otherwise control sites where radioactive contamination remains from the early years of the nation's atomic energy program or from commercial operations that Congress authorized DOE to remedy. Of the 46 FUSRAP sites, 40 are Manhattan Engineer District (MED) or AEC sites that are included in FUSRAP under authority of the Atomic Energy Act of 1954, as amended. The other six sites were added by Congressional action in 1984 and 1985. Six of the FUSRAP sites are listed on the Environmental Protection Agency's (EPA) National Priorities List (NPL).

Characteristic of Contamination: MED and AEC conducted several programs during the 1940s and 1950s involving research, processing, and production of uranium and thorium, and storage of residues that resulted from uranium and thorium processing. In the early years of the nation's nuclear energy development program, most uranium was extracted from foreign ores. Pitchblende was imported, stored for short periods, transported to sampling plants in the eastern United States, and finally transferred to mills and refineries for uranium extraction.

Some ores were processed for thorium content. Much of the Government-sponsored research and development was conducted at national laboratories and at colleges and universities. Commercial firms produced the needed raw concentrate that was then refined and converted into other uranium and thorium compounds or transformed into metal. Most of the metals were ultimately transported to MED and AEC sites in the vicinity of Richland, Washington; Oak Ridge, Tennessee; and Aiken, South Carolina, for further processing. Commercial firms also conducted operations to recover uranium from scrap and to salvage ferrous and nonferrous metals from radioactively contaminated scrap. Therefore, the contaminants of concern are:

- Uranium-238 and daughter isotopes (thorium-234, uranium-234, thorium-230, and radium-226)
- Thorium-232 and daughter isotopes (radium-228, thorium-228, and radium-224)

As a result of these activities, materials, equipment, buildings, and land became contaminated, primarily with naturally occurring radionuclides. As operations were completed or phased out and facilities closed or returned to non-nuclear uses, privately and institutionally owned sites were decontaminated or stabilized in accordance with survey methods and guidelines existing at the time; the sites were subsequently released for other uses.

1932

1. Title and location of project:	Formerly Utilized Sites Remedial Action Project (FUSRAP) 46 Sites in 14 States	2a. Project No. N-1.4.11 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

However, radiological guidelines have since become more stringent. FUSRAP objectives are to continue efforts to identify these formerly used MED and AEC sites, re-evaluate their radiological condition, take appropriate response action, establish controls consistent with existing legislative authority, and certify the sites for appropriate future use. Other sites used primarily for commercial ventures were added to FUSRAP by the Atomic Energy Act of 1954, and the 1984 and 1985 Energy and Water Development Appropriations Acts and subsequent reauthorizations.

Waste Strategy: Within the 30-year planning window, the remedial investigation/feasibility study (RI/FS) process will identify options, and permanent disposal actions will be taken on approximately 2.3 million cubic yards of material from FUSRAP sites. Permanent disposal options must be identified or developed for this low-level radioactive and mixed waste to support cleanup plans. While feasibility studies will evaluate many cleanup options, for planning purposes the cleanup strategy utilized known effective remedial actions methods; i.e., contaminated soil will be excavated and disposed of or stored in an appropriate facility.

Facility Construction Activities: FUSRAP has no activities that involve the construction of facilities such as office buildings, analytical laboratories, or other structures. While FUSRAP scope does include the construction of waste containment cells, there are no construction activities that result in facilities that would have utility after the completion of cleanup efforts.

Scope: FUSRAP Scope includes:

- Records searches and radiological assessments to identify sites formerly used to support the MED/AEC work and to determine if there is authority to conduct remedial action under FUSRAP.
- Surveillance and maintenance of DOE-owned or DOE-operated sites (including interim storage facilities) as necessary to maintain public safety and reduce radiological impact to as low as reasonably achievable, in preparation for remedial action.
- Integrated planning, engineering, and technology development as necessary to support evaluation of long-range disposition alternatives.
- Completion of environmental documentation process as required under Comprehensive Environmental Response, Compensation and Liability Act/National Environmental Policy Act (CERCLA/NEPA).
- Planning and implementation of the remedial action program required to adequately clean up the sites including final waste disposal.
- Verification and certification activities at each site necessary to ensure that the response action is complete and that the site is available for appropriate use.

1. Title and location of project:	Formerly Utilized Sites Remedial Action Project (FUSRAP) 46 Sites in 14 States	2a. Project No. N-1.4.11 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The current listing of FUSRAP sites follows:

Missouri:
Latty Avenue Properties (Hazelwood)
St. Louis Airport Site (St. Louis)
St. Louis Airport Site Vicinity Properties (St. Louis)
St. Louis Downtown Site (St. Louis)

New York Sites:
Niagara Falls Storage Site (Lewiston)
Colonie (Colonie)
Ashland 1 (Tonawanda)
Ashland 2 (Tonawanda)
Linde Air Products (Tonawanda)
Seaway Industrial Park (Tonawanda)
Bliss & Laughlin Steel (Buffalo)

New Jersey Sites:
Maywood (Maywood/Rochelle Park)
Wayne (Wayne)
Middlesex Sampling Plant (Middlesex)
New Brunswick Site (New Brunswick)
DuPont & Company (Deepwater)

Other Sites:
Shpack Landfill (Norton, MA)
Ventron (Beverly, MA)
W. R. Grace & Company (Curtis Bay, MD)
Madison (Madison, IL)
Luckey (Luckey, OH)
Painesville (Painesville, OH)
B&T Metals (Columbus, OH)
Baker Brothers (Toledo, OH)
CE (Windsor, CT)

Completed Sites:
Acid/Pueblo Canyons (Los Alamos, NM)
Albany Research Center (Albany, OR)
Bayo Canyon (Los Alamos, NM)
Chupadera Mesa (White Sands Missile Range, NM)
Kellex/Pierpont (Jersey City, NJ)
Middlesex Municipal Landfill (Middlesex, NJ)
National Guard Armory (Chicago, IL)
Niagara Falls Storage Site Vicinity Properties (Lewiston, NY)
University of California (Berkeley, CA)
University of Chicago (Chicago, IL)
Elza Gate (Oak Ridge, TN)
Seymour Specialty Wire (Seymour, CT)
Granite City Steel (Granite City, IL)

Baker & Williams Warehouses (New York City, NY)
Aliquippa Forge (Aliquippa, PA)
C. H. Schnoor (Springdale, PA)
Alba Craft (Oxford, OH)
HHM Safe Co. (Hamilton, OH)
General Motors (Adrian, MI)
Chapman Valve (Indian Orchard, MA)
Associate Aircraft (Fairfield, OH)

1934

1. Title and location of project:	Formerly Utilized Sites Remedial Action Project (FUSRAP) 46 Sites in 14 States	2a. Project No. N-1.4.11 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

New York Sites: OR-1301-AA
This activity covers all environmental assessment and remediation work at the seven radioactively contaminated sites in New York. These sites are under the DOE FUSRAP, and include the Tonawanda sites (Ashland 1, Ashland 2, Linde, Seaway) Colonie, Bliss & Laughlin Steel, and Niagara Falls Storage Site. Six of the seven contaminated sites contain radioactive residues from uranium processing activities conducted by the U.S. Government during and after World War II. The Colonie site milled uranium metals under contract to the Department of Defense. FUSRAP sites are also being assessed for chemical contamination.

FY 1997 - FY 2001 Activities:
Seaway and Linde remedial actions will start and be completed. Restoration of the Wetlands at Ashland 2 will be completed. Removal of decontaminated soil at Colonie will start. Post-remedial action reports (PRARs) for Ashland 2, Seaway, and Linde will be prepared and the certification dockets completed, including Ashland 1 remedial action will start and be completed and the certification docket for Bliss and Laughlin will also be completed.

New Jersey Sites: OR-1302-AA
This activity covers all environmental assessment and remediation work at the five radioactively-contaminated sites in New Jersey. These sites are under the DOE FUSRAP and include the Middlesex Sampling Plant, Wayne, Maywood, New Brunswick Site, and DuPont and Company. The five contaminated sites contain radioactive residues from uranium processing activities conducted by the U.S. Government during and after World War II, or thorium waste from commercial operations that Congress authorized DOE to address. FUSRAP sites are also being assessed for chemical contamination resulting from these activities.

FY 1997 - FY 2001 Activities:
Continue pile removal activities for Wayne and Maywood. Remedial action will start and be completed for New Brunswick and the PRAR and certification docket will also be completed. At Middlesex, remedial action and the PRAR will be completed.

Missouri: OR-1303-AA
This activity covers all work at the four radioactively contaminated sites in Missouri. The sites are under the DOE FUSRAP. The Missouri sites are located in the St. Louis area and include the St. Louis Airport Site, the St. Louis Downtown Site, the Latty Avenue Properties, and SLAPS vicinity properties. The sites contain radioactive residues from uranium processing activities conducted by the U.S. Government during and after World War II. Congress authorized DOE to address three of the sites which are on the EPA's NPL. FUSRAP sites are also being assessed for chemical contamination resulting from these activities.

1. Title and location of project:	Formerly Utilized Sites Remedial Action Project (FUSRAP) 46 Sites in 14 States	2a. Project No. N-1.4.11 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

FY 1997 - FY 2001 Activities:
Remedial action at SLAPS vicinity properties will continue. Remedial action at SLAPS, Latty Avenue Properties, and St. Louis Downtown Site will continue.

Other Sites: OR-1304-AA
This activity covers all environmental assessment and remediation work at radioactively contaminated sites in Maryland (W. R. Grace); Massachusetts (Ventron, Shpack Landfill, Illinois (Madison); and Ohio Baker Brothers, B&T Metals, Luckey, and Painesville). These sites are under the DOE FUSRAP. These sites are privately-owned and operated industrial facilities that represent a potential source of contamination for vicinity properties. The sites contain radioactive residues from uranium processing activities by the U.S. Government during and after World War II. FUSRAP sites are also being assessed for chemical contamination resulting from these activities.

FY 1997 - FY 2001 Activities:
At Shpack, MA remedial action will be performed by the Principle Responsible Party (PRP), and the PRAR and certification docket will be completed. Remedial action will be completed at Ventron, MA as will the PRAR and certification docket. Remedial action at B&T Metals, OH will be completed as will the PRAR and certification docket. Remedial action at Luckey, OH will start. Characterization of Madison, IL will start. Remedial action at W.R. Grace, MD will be completed and the PRAR will be started. The certification docket will be completed at Baker Brothers, OH.

Purpose:
The objectives of FUSRAP are to:

- Identify and assess all sites formerly used to support early MED/AEC nuclear work to determine whether further decontamination and/or control is needed.
- Decontaminate and/or apply controls to these and other FUSRAP sites to permit conformance with current applicable guidelines.
- Dispose of and/or stabilize all generated residues in a radiologically and environmentally acceptable manner.
- Certify that response action is complete and site is available for appropriate use.

1936

1. Title and location of project:	Formerly Utilized Sites Remedial Action Project (FUSRAP) 46 Sites in 14 States	2a. Project No. N-1.4.11 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Justification:
The Atomic Energy Act of 1954, as amended, authorized DOE to perform radiological surveys and other research. This work includes radiological monitoring at sites used to support the nuclear activities of DOE's predecessor agencies.

The 1984 Energy and Water Development Appropriation Act authorized DOE to conduct a decontamination research and development project at four sites (Colonie, Wayne, Maywood, and Latty Avenue properties). The 1985 Energy and Water Development Appropriation Act authorized DOE to acquire title to the St. Louis Airport Site, perform necessary response action, and develop the property as a disposal site for the waste currently on-site and for waste from response actions conducted on vicinity properties and the Latty Avenue properties. Continued authorization has been provided each year in the passage of subsequent Energy and Water Development Appropriations Acts. DOE has authority to conduct response actions at 46 FUSRAP sites.

CERCLA authorizes DOE to conduct response actions on FUSRAP sites. DOE has entered into Federal Facility Agreements with EPA to conduct response actions at sites on the NPL, with the exception of Shpack (where DOE is not a PRP).

CERCLA and NEPA Compliance:
FUSRAP follows a process for integrating the requirements of both CERCLA and NEPA in a manner consistent with DOE Orders, CERCLA, NEPA, and Federal and State applicable or relevant and appropriate regulations (ARARs).

CERCLA mandates completion of remedial investigation/feasibility studies, selection of response action alternatives, and documentation in a Record of Decision (ROD), as well as implementation of the ROD through remedial design and remedial action.

Radiological and Chemical Remediation and Waste Control Guidelines:
Radiological remediation and waste control guidelines for storage and disposal of FUSRAP wastes are provided in DOE Order 5400.5. For radionuclides not covered by DOE Order 5400.5, site-specific guidelines are developed and approved by DOE. Chemical remediation and control guidelines are developed from Federal and State ARARs on a site-specific basis.

Facility Design Criteria:
DOE Order 6430.1A, "General Design Criteria", is being used in the planning and design of waste storage facilities.

1987

1. Title and location of project:	Formerly Utilized Sites Remedial Action Project (FUSRAP) 46 Sites in 14 States	2a. Project No. N-1.4.11 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Site Operations:
All work will be accomplished in accordance with (1) appropriate landowner agreements; (2) local and State environmental and land-use requirements, to the extent permitted by Federal law; and (3) applicable Federal regulations, standards, policies, and procedures, including DOE Orders.

If assessment/cleanup work were halted or delayed, DOE could be perceived as not taking timely action to reduce or eliminate environmental, health, and safety problems at the privately owned residential and commercial sites. The ability of property owners to modify or sell their properties could be inhibited as long as the contamination remains in place. Delays could lead to intense public and political concern and demands for timely action. Reactions could be particularly intense because private citizens and companies are involved. Halting or delaying the timely completion of assessment and subsequent cleanup actions could result in leaving uncontrolled radioactive contamination on privately owned residential and commercial properties. The possibility for uncontrolled spread of this contamination is high, especially for those sites that DOE does not own, because DOE has no effective control of these sites. The spread of contamination, with the attendant risk of exposure to greater numbers of the general public and increased cleanup costs has already occurred at several locations.

9. Method of Performance

The environmental studies contractor for FUSRAP, Science Applications International Corporation (SAIC), is responsible, under direction from DOE, for the planning, management, and execution of the CERCLA RI/FS process and for meeting NEPA and Resource Conservation and Recovery Act requirements. SAIC interfaces closely with the project management contractor (PMC). SAIC's contract was awarded on the basis of competitive bidding and is accomplished by Cost Plus Fixed Fee.

The PMC for FUSRAP, Bechtel National, Inc. (BNI), is responsible for project integration and the planning, management, and execution of response action activities. BNI administers subcontracts, coordinates the sequence of operations and the relationships among subcontractors, and ensures completion of the program in accordance with DOE objectives. On approval from Oak Ridge, BNI executes response actions as required. BNI subcontracts response action work at FUSRAP sites to the extent that is cost-effective and programmatically expedient. BNI is responsible for monitoring and controlling all day-to-day activities at remedial action sites. In addition, BNI is responsible for defining and implementing quality assurance procedures, environmental compliance activities, and safety programs to meet DOE requirements for all sites. BNI's contract was awarded on the basis of competitive bidding and is accomplished by Cost Plus Fixed Fee. To the extent feasible, construction and other contracts issued by the PMC shall be accomplished by Fixed Price contracts awarded on the basis of competitive bidding.

1. Title and location of project:	Formerly Utilized Sites Remedial Action Project (FUSRAP) 46 Sites in 14 States	2a. Project No. N-1.4.11 2b. Operating Expense Funded

9. Method of Performance (continued)

Argonne National Laboratory (ANL) provides technical support to Former Site Restoration Division (FSRD) through technical review of analyses and documents and through assistance to the FUSRAP self-assessment program. The Oak Ridge National Laboratory (ORNL) also provides technical support to FSRD by conducting environmental audits of activities at FUSRAP sites. Oak Ridge Institute for Science and Education (ORISE) and ORNL conduct radiological surveys in support of DOE Headquarters functions associated with site identification and assessment and with remedial action verification and certification activities. These activities are performed under the direction of the FUSRAP Program Manager. The ANL, ORNL, and ORISE contracts were awarded on the basis of competitive bidding. They are management and operating type contracts and are accomplished by Cost Plus Award Fee.

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 345,779	$ 74,100	$ 73,982	$ 83,079	$ 429,572	$ 1,006,512
2. Decontamination & Dismantlement	0	0	0	0	0	0
3. Long-term S&M	0	0	0	0	0	0
4. Landlord	0	0	0	0	0	0
5. Compliance Oversight	0	0	0	0	0	0
b. Contingency	0	0	0	0	0	0
Total	$ 345,779	$ 74,100	$ 73,982	83,079	429,572	$ 1,006,512

11. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

WASTE MANAGEMENT - NON-DEFENSE

PROGRAM MISSION

For nearly five decades the Department of Energy (DOE) and its predecessors, the Energy Research and Development Administration and the Atomic Energy Commission, have been generating radioactive waste from research and development activities. Those activities produced large quantities of waste, which was stored or disposed of in a manner that does not meet today's more stringent environmental, safety and health requirements. Much of the stored waste contains radioactive materials, hazardous chemicals, or both.

The mission of the Waste Management Program is to protect people and the environment from the hazards of DOE waste by providing an effective and efficient system to treat, store, and dispose of the waste as soon as possible. The Department has developed integrated planning strategies for each type of waste managed across the DOE complex, including: high-level waste (HLW), transuranic waste (TRU), low-level waste (LLW), mixed low-level waste (MLLW), hazardous waste (HAZ), and sanitary waste (SAN). These strategies support the waste management mission by focusing on a 10-year horizon, when much progress will be made. The strategies incorporate performance measures to evaluate progress on reducing current backlog of waste through treatment and disposal and the ability to routinely manage new waste as generated. By 2005, each waste-type program will achieve at least half of its overall mission, with the exception of HLW. The budget supports maintaining an acceptable level of risk, while making significant progress toward mission completion in FY 1997.

In response to direction from Congress, the Corrective Activities budget was combined with the Waste Management Budget starting in FY 1996. There are only two projects requiring funding in FY 1997, all other projects being completely funded. There will be no future requests for new Corrective Activities. Other Budgets combined with the Waste Management Budget by the FY 1996 Appropriation include the West Valley Demonstration Project and the National Low-Level Waste Program. Further adjustments, which provide greater management flexibility are the inclusion of capital equipment and general plant project funding with operating expenses in a category known as Operations and Maintenance.

WASTE TYPE STRATEGY

High-Level Waste

High-level waste is the highly radioactive material resulting from the reprocessing of spent nuclear fuel. It includes mainly liquid waste remaining from the recovery of uranium and plutonium from spent fuel. The long-term objective in the management of high-level waste (HLW) is to dispose of the radioactive portion of the waste in a geologic repository. The Waste Management Program supports activities of other DOE organizations to assure a geologic repository is completed. Near-term goals for the Waste Management Program include solidifying liquid HLW (approximately 2,200 m^3 total) at the West Valley Demonstration Project in New York, which will be stored awaiting the opening of a geologic repository for disposal. In FY 1997, it is expected that about 120 canisters of HLW will be produced at West Valley. The benefit of this program is stabilizing HLW in a form suited for long-term storage pending disposal.

Transuranic Waste

Transuranic (TRU) waste is radioactive waste containing more than 100 nanocuries per gram of alpha-emitting isotopes with atomic numbers greater than 92 (uranium) and half-lives greater than 20 years. This waste is the result of fuel reprocessing or other research and development activities. For some TRU waste, little or no shielding is required; this waste is referred to as "contact-handled" TRU waste. On the other hand, there are TRU radionuclides which require shielding because of their gamma or neutron emissions. These are referred to as "remote-handled" TRU waste.

Relatively small amounts, about 550 cubic meters, of TRU waste are stored at West Valley. This is the largest concentration of non-defense TRU waste and represents about 50 curies of radioactivity. Other non-defense sites store a total of less than 100 cubic meters of TRU waste. The most pressing problem with non-defense TRU waste continues to be disposal. Because the volume of waste is small, it is not economically feasible to build a separate facility similar to the Waste Isolation Pilot Plant (WIPP) for disposal of non-defense TRU waste. However, legislation precludes disposal of the non-defense generated TRU waste at WIPP.

The near-term goal is to keep the waste in safe storage until a decision is made regarding the disposal of non-defense TRU. The long-term goal is to make the decision regarding the disposal of this waste and then begin implementation of that decision.

Low-Level Waste

Low-level waste (LLW) is defined as any radioactive waste which is not high-level waste, transuranic waste, spent nuclear fuel, or mill tailings. The Waste Management Program is responsible for the disposal of LLW from non-defense funded facilities, and for the operation of the National Low-Level Waste Program. The goal of the National LLW Program is to facilitate the establishment of a reliable nationwide system for management of commercially generated LLW by implementing responsibilities assigned to DOE under Public Law 99-240, "Title I Low-Level Radioactive Waste Policy Amendments Act of 1985." The Act assigned states the responsibility for providing, either individually or in cooperation with other states, disposal of LLW generated within their borders. Responsibilities assigned to DOE by the Act include technical and financial assistance to compacts and states in meeting their responsibilities, annual reporting to Congress on progress being made by states on LLW management in the U.S., certain administrative and financial functions, and disposal of the Greater-Than-Class-C LLW resulting from activities of licensed generators. The National Low-Level Waste Program will continue to provide technical assistance to states and compact regions by facilitating information exchange through the Host State Technical Coordinating Committee, the LLW Forum, and the Annual DOE LLW Management Conference; by preparing technical modules and reports on LLW management issues of interest to the states; by providing workshops, performance assessment assistance, liaison services, and assistance with state-specific requests; and by providing data systems support.

The Program will also continue to manage the surcharge rebate process and prepare the reports required by the Act. The Greater-Than-Class-C Low-Level Radioactive Waste Program will continue to develop storage and disposal capability for the Greater-Than-Class-C LLW and implement Greater-Than-Class-C sealed source storage. Interim storage can be provided on an urgent case-by-case basis for the Greater-Than-Class-C that poses an immediate threat to public health. Dedicated storage and treatment capability will be developed as required for long-term storage until disposal is feasible.

The benefits of this Program include safe storage and disposal of DOE waste and safe storage of commercially generated waste until disposal options are identified and implemented. Significant activities from the past year include publication of policy and procedures concerning rebates to states or compacts in accordance with milestones established in Public Law 99-240, and routine disposal of LLW from DOE research and development facilities.

Mixed Low-Level Waste

Mixed low-level waste consists of both hazardous (as defined by the Resource Conservation and Recovery Act) and radioactive (as defined by the Atomic Energy Act) components, and is not classified as high-level, low-level, or TRU mixed waste. The long-term goal for low-level mixed waste is to develop necessary treatment and disposal capacity needed to dispose of the existing inventory as well as newly generated waste.

PROGRAM MISSION - WASTE MANAGEMENT - NON-DEFENSE (cont'd)

Mixed Low-Level Waste - (cont'd)

The Department worked with the states, the Environmental Protection Agency (EPA), Indian Tribes, and stakeholders through the Federal Facility Compliance Act process and other mechanisms to develop a national configuration of mixed waste treatment facilities. The Department will have in place by 1997 35 Site Treatment Plans enforced by the state or EPA through compliance orders for the development of mixed waste treatment capacity. The Department is also continuing to work with the states, EPA, Indian Tribes, and stakeholders to determine location of disposal facilities. The near-term goal for mixed waste is to develop treatment capacity as outlined in the Site Treatment Plans and to complete site selection for disposal facilities. Many activities related to securing contracts with private vendors will be ongoing in FY 1997.

Hazardous and Sanitary Waste

Hazardous waste is defined by the Resource Conservation and Recovery Act (RCRA). It consists of waste, which because of its concentration or physical or chemical characteristics, may cause or contribute to mortality or illness or pose a substantial threat if not properly managed. Hazardous waste is primarily treated and disposed of by commercial vendors. Hazardous waste can be harmful to humans by chemically or physically attacking skeletal, nervous, or other bodily systems. In many ways, hazardous waste is more difficult to manage than radioactive waste because chemicals in waste may have an unknown synergistic effect and exposure cannot be easily monitored. The most common hazardous wastes generated by DOE include spent solvents, corrosives, ignitables, metals, specialty chemicals used by research and development laboratories, explosives, polychlorinated biphenyls (PCBs), and asbestos.

Sanitary waste is office waste, cafeteria waste, sewage, sewage sludges, plastic, wood, rubber, rags, and similar materials. Solid sanitary waste is disposed in approved sanitary landfills, and liquid sanitary waste is treated in wastewater treatment facilities prior to discharge in receiving streams. The Department uses both on-site and off-site disposal facilities for sanitary waste, treatment, and disposal.

The near- and long-term goals for the management of both hazardous and sanitary waste are the same: maintain regulatory compliance while treating and disposing of waste as it is generated. The mission of the hazardous/sanitary waste program has been realized and in FY 1997 activities continue. Efforts focusing on improvements to the efficiency of that program will be ongoing.

Three non-defense facilities appear on a list of the 10 largest hazardous waste generators: the Stanford Linear Accelerator Center (SLAC), Argonne National Laboratory-East (ANL-E), and the Energy Technology Engineering Center (ETEC). As shown in the budget request, the Waste Management Program is providing increased storage, treatment, or disposal capacity to meet the need or to replace existing facilities, which have reached the end of their design life. The past year's achievements include routine, compliant treatment, storage, and disposal of hazardous and sanitary waste at non-defense sites, and continued development of robust, effective, waste management programs at sites such as SLAC and ETEC.

PROGRAM MISSION - WASTE MANAGEMENT - NON-DEFENSE (cont'd)

The GOALS of the Non-Defense Waste Management program are:

1) To protect public and worker safety and health and the environment from the dangers of DOE's radioactive and hazardous waste. The Program will continue to make progress on reducing long-term risk by treating waste with the goal of ultimate disposal.
2) To work in partnership with our regulators and stakeholders to prioritize activities and find new approaches to the problems we face in order to reduce cost. The FY 1997 request was developed assuming that, for certain activities, a more cost-effective approach can be developed in cooperation with our regulators.
3) To perform activities related to treatment and disposal to move towards completion of mission.

The PERFORMANCE MEASURES related to these goals are:

The Office of Waste Management plans to measure success of its FY 1997 program by the amount of DOE waste it treats, stores, and disposes.

Specific Waste Treatment Activities include:

1) Continuing HLW Treatment at the West Valley Demonstration Project in FY 1997 to reduce risk associated with storage of liquid HLW;
   - Produce about 120 canisters of vitrified HLW through continued operations of the West Valley Demonstration Project.

2) Implementing Site Treatment Plans as negotiated through the Federal Facility Compliance Act (FFCAct) process;
   - Begin or accelerate mixed waste treatment at various DOE locations in response to the Federal Facility Compliance Act.
   - Secure contracts for private vendor treatment.

Specific Waste Storage and Disposal Activities include:

1) Assisting states and compact regions in fulfilling their responsibilities to establish a national LLW management system for commercially-generated LLW under Public Law 99-240.

The following list defines the funding categories used in this budget by the Office of Waste Management. The Program is planning to change these categories in the near future to align the description of work performed to waste type.

Program Management

The Program Management Category provides a number of management support activities to the Waste Management Program. This category includes strategic and long-range planning activities, technical expertise on Safety and Environmental documentation preparation and review. Also included in program support is funding to cover Federal Facilities Compliance Act and other compliance activities associated with the DOE Waste Management Program.

The near-term goal is to have sufficient support and oversight so that no environmental, health or safety non-compliances occur. The benefits include adequate support for management control, planning, cost reviews and identification of environment, safety or health issues, which can be dealt with in a reasoned and structured manner.

Facility Operations and Maintenance

This budget category funds the routine operation and maintenance of treatment and storage facilities for all waste types at non-defense funded facilities. Disposal facilities are not funded in this budget. Waste is either disposed off-site or held in storage pending the opening of disposal facilities, such as those that are needed for high-level and transuranic waste. Facility operations and maintenance includes a comprehensive set of base program activities essential to assure effective and efficient operation of DOE waste management facilities. Examples of activities funded include securing permits and preparation of reports required by environmental regulations, general training and support of technical contractor staff, operation and maintenance of facilities needed to treat HLW, LLW, mixed waste, sanitary or hazardous wastes.

Near-term goals for these activities include routine treatment, storage and disposal of all waste types, including reducing the backlog of low-level waste, continuing the PCB cleanup at the Fermi Main Accelerator Ring, which should be completed in FY 1999, and completing 78 percent of the B-cell restoration project at Richland. The benefits of these activities are that they provide a compliant treatment, storage, and disposal system that protects the health and safety of workers, the public and the environment, while reducing risk and protecting the environment.

New Facilities

This program category includes the costs of engineering studies, designs, and construction costs of new projects and modifications to existing facilities needed for waste management operations. It also includes any environmental impact documentation, Safety Analysis Reviews (SAR) and Operational Readiness Review (ORR) necessary to construct and begin operations of a new or substantially modified facility. Once the facility is operating, all of annual and outyear costs, including capital equipment not related to construction, will be funded under the Facilities Operations and Maintenance budget.

A major milestone was completion of construction of the waste management facility at Brookhaven in FY 1996. The benefits of completing these activities are that they will replace aging facilities, which could become non-compliant and will provide needed expanded capacity to compliantly manage waste.

West Valley Demonstration Project

The goal of the West Valley Demonstration Project is to demonstrate solidification for disposal of High-Level Waste (HLW) under the provisions of Public Law 96-368, the "West Valley Demonstration Project Act" enacted in 1980. The project is implementing an integrated production-scale development and demonstration project for treating the 660,000 gallons of alkaline and acidic liquid HLW stored at the Western New York Nuclear Service Center, near West Valley, New York. The Center reprocessed spent nuclear fuel from 1966 to 1972. By virtue of demonstrating the solidification of liquid HLW, the hazards associated with continued storage of the liquid wastes at the Center will be eliminated. Major activities embodied in the project include: (1) decontamination required to prepare existing facilities and equipment; (2) removal of the wastes from the underground storage tanks; (3) development, design, construction, and operation of systems for solidification of the waste; (4) acquisition of disposal containers; (5) temporary storage and transportation of the solidified waste; (6) decontamination and decommissioning (D&D) of the waste tanks, facilities, hardware, and material used in carrying out the project; and (7) disposal of LLW and transuranic (TRU) waste produced from project activities.

PROGRAM MISSION - WASTE MANAGEMENT - NON-DEFENSE (cont'd)

National Low-Level Waste

The National Low-Level Waste (LLW) Program provides timely and effective implementation of DOE responsibilities mandated by Public Law 99-240 and provides technical assistance to the states in meeting their responsibilities for management and disposal of their LLW.

Solid Waste

Funds provided under this budget category address Corrective Activities necessary to bring out-of-compliance non-defense facilities into compliance with RCRA, TSCA, provisions of the Hazardous and Solid Waste Amendment's, State and Local Ordinances, and DOE Orders. Only one project continues to be funded under this budget, and no new Corrective Activities will be requested.

WASTE MANAGEMENT - NON-DEFENSE

ALBUQUERQUE

I. Mission Supporting Goals and Objectives

The Albuquerque Operations Office has only one site funded in the Energy Supply, Research and Development Appropriation: the Inhalation Toxicology Research Institute (ITRI). The ITRI conducts studies on the health effects of inhaling potentially hazardous airborne materials. The studies may include radioactive material, insulating materials, diesel exhaust emissions or other substances from energy production or conservation technologies. The research activities produce very small amounts of biomedical, transuranic, mixed, low-level, hazardous and sanitary waste.

Like the rest of the non-defense laboratories, ITRI generates only small volumes of waste. Historically, its waste management program lacked credibility for a variety of reasons, and the establishment of such a program has been a priority for the past several years. In this regard, ITRI has been successful because almost all waste types are now managed under environmental regulations as they are generated.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Facility Operations and Maintenance	$ 654	$ 604	$ 596	$ -8	-1%
TOTAL, Albuquerque	$ 654	$ 604	$ 596	-8	-1%

III. Performance Summary

FY 1995 Accomplishments

- Treated, stored, and disposed 6 metric tons of RCRA hazardous, 5 m^3 mixed and 46 m^3 radioactive waste at ITRI.
- Initiated shipments of 18 m^3 radioactive waste from ITRI to the Nevada Test Site (NTS).

III. Performance Summary - Albuquerque (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- Continue treatment, storage, and disposal of hazardous, radioactive, and mixed waste.
- Continue disposal of approximately 20 m^3 of LLW inventory at NTS.

FY 1997 Planned Accomplishments

- Continue treatment, storage, and disposal of hazardous, radioactive, and mixed waste and disposal of 22 m^3 LLW inventory at NTS ..... $ 596

TOTAL, ALBUQUERQUE ..... $ 596

1953

CHICAGO

I. Mission Supporting Goals and Objectives

The Chicago Operations Office manages six sites: Ames Laboratory in Iowa, Argonne National Laboratory-East (ANL-E) in Illinois, Argonne National Laboratory-West (ANL-W) in Idaho, Brookhaven National Laboratory (BNL) in New York, Fermi National Accelerator Laboratory (FERMI-LAB) in Illinois, and the Princeton Plasma Physics Laboratory (PPPL) in New Jersey. These six facilities are laboratories devoted to fundamental and applied research in high energy physics, energy production from fusion and biological and medical research. The main types of waste associated with these facilities are low-level, mixed low-level, hazardous and sanitary wastes.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 18	$ 1,500	$ 500	$-1,000	-67%
Facilities Operations and Maintenance	30,158	18,752	26,979	+8,227	+44%
New Facilities	14,169	1,322	3,175	+1,853	+140%
TOTAL, Chicago	$ 44,345	$ 21,574	$ 30,654	$+9,080	+42%

III. Performance Summary

FY 1995 Accomplishments

- Established baselines for waste management programs at the Chicago sites to ensure compliant treatment, storage, and disposal activities for Hazardous, Low-Level, Transuranic, and Mixed Wastes.
  - Shipped and disposed at Hanford approximately 12,000 m^3 of annually generated LLW from the Ames Laboratory, ANL-E, ANL-W, BNL, FERMI-LAB, and PPPL.
  - Disposed of approximately 275 tons of annually generated hazardous waste.
- Repackaged and disposed of approximately 450 m^3 of legacy LLW from ANL-E and BNL to Hanford in FY 1995.
- Completed Proposed Site Treatment Plans as required by the FFCAct of 1992.
- Completed canal sludge pond re-connection at ANL-E.

III. Performance Summary - Chicago (cont'd)

FY 1995 Accomplishments - (cont'd)

- Initiated physical construction on Waste Management construction projects at several sites as follows:

  - Rehabilitation of Waste Management Building #306, ANL-E, Project No. 91-E-600.
  - Sanitary Waste Water Treatment Plant Improvements, ANL-E, Project No. 91-E-304.
  - Waste Management Facility, BNL, Project No. 91-E-305.
  - New Radioactive Waste Handling Facility, PPPL, Project No. 95-E-601.
  - Radioactive Waste Handling Building, Fermi-Lab, Project No. 94-E-601.

FY 1996 Accomplishments (To Date and Planned)

- Complete construction of new Waste Management Facility at BNL, Project No. 91-E-315, to replace existing facilities, which are to be remediated per an Interagency Agreement between DOE, the Environmental Protection Agency, and the State of New York.
- Complete construction of new Radioactive Waste Handling Building at Fermi-Lab, Project No. 94-E-601, to provide LLW storage, sorting and handling.
- Complete construction of Radioactive Waste Handling Facility at PPPL, Project No. 95-E-601, to provide safe and sufficient storage capacity for LLW.
- Complete construction of Radioactive and Mixed Waste Storage Facilities at ANL-E, Project No. 91-E-602, to provide compliant storage for these waste streams.
- Complete rehabilitation of LLW handling area in the ANL-E waste management facility.
- Complete floor drain re-connection at BNL, Project No. 93-E-632.

FY 1997 Planned Accomplishments

• Continue to store and dispose of hazardous, mixed and radioactive waste generated by laboratory research, and provide a safe and effective Waste Management Program at ANL-E, ANL-W, BNL, PPPL, FERMI-LAB, and the Ames Laboratory	$22,311
• Operate Sodium Processing Facility (SPF) to treat 70,000 gallons of bulk sodium (ANL-W)	2,070
• Complete installation of 100 new liners with cathodic protection to prevent soil contamination from sodium, spent fuel, spent fuel slugs, and sodium/potassium (NaK) metal. Sodium and spent fuel require remote-handling (ANL-W)	299
• Rehabilitate liquid LLW area in the Waste Management Building (ANL-E)	2,167
• Dispose of annually generated (about 33,000 ft^3) low-level radioactive waste (ANL-E, ANL-W, BNL, Fermi-Lab, Ames)	2,997
• Construct stormwater detention cell at PPPL	450
• Begin design of Waste Handling Facility, Project No. 97-E-600, to consolidate waste handling and storage at the site (ANL-W)	360
TOTAL, CHICAGO	$30,654

1995

III. Performance Summary - Chicago (cont'd)

Explanation of Funding Changes FY 1996 to FY 1997

- Increased FY 1997 funding initiates operation of the Sodium Processing Facility to treat 70,000 gallons of bulk sodium at ANL-W ($2M), completes on going rehabilitation of the Waste Management building at ANL-E ($2.1M), designs the Waste Handling Facility at ANL-W ($0.3M), completes construction of the storm water detention cell at PPPL ($0.4M); and disposes of LL legacy waste at BNL ($0.8M).

Major Issues

- None

IDAHO

I. Mission Supporting Goals and Objectives

The Idaho Operations Office manages the National Low-Level Waste Program. The purpose of the National Low-Level Waste Management Program is two-fold: (1) to provide technical and financial assistance to states and compact regions in fulfilling their responsibilities to establish a national LLW management system under Public Law 99-240; and (2) to plan for disposal options of the Greater-Than-Class-C LLW to mitigate public health and safety hazards from such waste. This purpose directly supports Waste Managements goals and objectives that are outlined in the Program Mission. The key goals and objectives of the National Low-Level Waste Management Program include providing relevant workshops at the request of states, providing information exchange opportunities through such mechanisms as the Host State Technical Coordinating Committee and the Annual DOE Conference on LLW Management, and providing for the disposal of the Greater-Than-Class-C LLW and mitigation of public health and safety risks from such waste by implementing sealed source storage and management at the Los Alamos National Laboratory.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
National Low-Level Waste	$ 5,610	$ 2,865	$ 4,958	$ +2,093	+73%
TOTAL, Idaho	$ 5,610	$ 2,865	$ 4,958	$ +2,093	+73%

III. Performance Summary

FY 1995 Accomplishments

- Completed a total of 25 workshops requested by states and compact regions.
- Conducted the 16th Annual DOE Conference on LLW Management and to date held two meetings with the Host State Technical Coordinating Committee and the LLW Forum.
- Developed program strategy for the Greater-Than-Class-C LLW and sealed source management.

FY 1996 Accomplishments (To Date and Planned)

- Complete all workshops requested by states and compact regions. Current plan is for approximately 20 workshops in FY 1996.
- Conduct the 17th Annual DOE Conference on LLW Management and three meetings each of the Host State Technical Coordinating Committee and the LLW Forum.
- Begin operation of sealed source storage.

III. Performance Summary - Idaho (cont'd)

FY 1997 Planned Accomplishments	
• Support the National Low-Level Waste Program for hazardous, radioactive, and mixed waste	$ 4,958
TOTAL, IDAHO	$ 4,958

Explanation of Funding Changes FY 1996 to FY 1997

- The FY 1997 level of effort remains the same as FY 1996.
- The apparent increase in funds is due to the program's use of uncosted balances in FY 1996 to level workload between FY 1995 and FY 1997.

Major Issues

- None

1953

OAKLAND

I. Mission Supporting Goals and Objectives

The Oakland Operations Office manages waste operations at the Laboratory for Energy-Related Health Research (LEHR), Lawrence Berkeley National Laboratory (LBNL), Lawrence Livermore National Laboratory (LLNL), Energy Technology Engineering Center (ETEC), and the Stanford Linear Accelerator Center (SLAC). The laboratories perform research in health effects of radiation exposure, energy research and high energy particle physics. The sites generate small volumes of radioactive, hazardous and sanitary waste.

For a variety of reasons, the establishment and maintenance of a rigorous, compliant waste management program is the major issue facing small sites. The ability of small sites to manage their waste is further challenged by the fact that due to the experiments they conduct, they produce a large number of small volume waste streams. The characterization, monitoring and other environmental requirements are the same whether a waste stream has an inventory of one or ten or 100,000 cubic meters. In addition, the State of California has an expanded list of chemicals it considers to be hazardous, and more material must be classified as hazardous waste in California than RCRA requires. This contributes to an increase in the cost of managing the waste. In the past year, however, the sites maintained compliance in the storage and disposal of wastes that were shipped off-site.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 2,289	$ 533	$ 650	$ +117	+22%
Facilities Operations and Maintenance	15,122	9,171	12,644	+3,473	+37%
New Facilities	1,714	671	0	-671	-100%
TOTAL, Oakland	$ 19,125	$ 10,375	$ 13,294	$ +2,919	+28%

III. Performance Summary

FY 1995 Accomplishments

- Completed and initiated building construction activities for the Hazardous Waste Handling Facility (HWHF) at LBL, Project No. 88-R-812.
- Completed site work design for the Radioactive and Mixed Waste Storage Facility General Plant Project at SLAC.
- Initiated design activities for the construction of the Wet Vapor Nitrogen Cleaning System to treat and manage sodium contaminated materials at ETEC.

III. Performance Summary - Oakland (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- Complete operational testing and begin operation of the Hazardous Waste Handling Facility (Project No. 88-R-812) at LBNL.
- Complete construction and testing of the New Radioactive and Mixed Waste Storage Facility at SLAC.

FY 1997 Planned Accomplishments

- Continue Waste Management Program at LBNL ($6.1M), SLAC ($3.4M), ETEC ($2.9M), and LEHR ($0.1M) to provide for the safe treatment, storage, transportation, and disposal of Hazardous, Radioactive, TRU, and mixed waste. Complete the transfer of operation from the old Hazardous Waste Handling Facility to the new Hazardous Waste Handling Facility .... $ 13,294

TOTAL, OAKLAND ..... $ 13,294

Explanation of Funding Changes FY 1996 to FY 1997

- Environmental Management becomes Landlord in FY 1997 at ETEC and $1.3 million will be used to process additional waste as a result of cleanup efforts.
- Additional $1.4 million will be used at LBNL to meet requirements of LBNL's Site Treatment Plan.
- Additional $.5 million to package and dispose of legacy waste before SLAC operates New Radioactive Waste Storage Facility.

Major Issues

- None

1960

OAK RIDGE

I. Mission Supporting Goals and Objectives

The Oak Ridge National Laboratory (ORNL) non-defense funded waste management activities primarily involve storage of hazardous waste, and treatment of gaseous, radiological and non-radiological process waste. Major activities in FY 1997 include upgrades to the Sanitary Sewer System, Project No. 93-E-633, final construction of the Bethel Valley Liquid LLW Collection and Transfer System Upgrades, Project No. 88-R-830, and the start-up of the Melton Valley LLW Collection and Transfer System Upgrade, Project No. 92-E-601. These activities will bring the systems into compliance with a consent decree and the Federal Facility Agreement, respectively.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Facility Operations and Maintenance	$ 12,314	$ 9,280	$ 9,386	$ +106	+1%
New Facilities	12,491	1,088	1,736	+648	-59%
Solid Waste	26,700	789	3,292	+2,503	+317%
TOTAL, Oak Ridge	$ 51,505	$ 11,157	$ 14,414	$ +3,257	+29%

III. Performance Summary

FY 1995 Accomplishments:

- Provided regulatory compliant treatment of gaseous waste, 285,000 m^3 of liquid radiological, and 665,000 m^3 of non-radiological process waste. Provided collection, transportation, and storage of 56 m^3 of hazardous waste at ORNL.
- Initiated construction associated with the Bethel Valley Federal Facility Agreement Upgrades, Project No. 94-E-602.
- Performed design or construction activities for General Plant Projects to upgrade waste management facilities.
- Provided support for design construction and operational reviews for the Melton Valley Liquid LLW Collection and Transfer System upgrade project in accordance with DOE Order 4700.1.
- Submitted design assessment to the Environmental Protection Agency and Tennessee for Phase II activities at the Bethel Valley Liquid LLW Collection and Transfer System upgrade project.

III. Performance Summary - Oak Ridge (cont'd)

FY 1996 Accomplishments (To Date and Planned):

- Continue at a minimal level of effort regulatory compliant treatment of gaseous and liquid radiological and non-radiological process waste and collection, transportation, and storage of hazardous waste at ORNL. Defer offsite shipment and treatment of waste until FY 1997.
- Continue construction of the Bethel Valley Federal Facility Agreement Upgrade, Project No. 94-E-602.
- Continue design and construction of General Plant Projects to upgrade facilities. Five upgrades will be completed.
- Complete construction of the Melton Valley Liquid LLW Collection and Transfer System Upgrade, Project No. 92-E-601.
- Provide System Safety Analysis and Operational Procedures for the Melton Valley Liquid LLW Collection and Transfer System project.
- Continue construction of the Bethel Valley Liquid LLW Collection and Transfer Systems Upgrades, Project No. 88-R-830.
- Continue construction of the Sanitary Waste System Upgrade, Project No. 93-E-633, at ORNL to meet the National Pollution Discharge Elimination System permit in accordance with a consent decree issued under a lawsuit.

FY 1997 Planned Accomplishments

• Continue regulatory compliant treatment of gaseous and liquid process waste (radiological: about 285,000 m^3; and non-radiological: about 665,000 m^3). Continue off-site shipments of hazardous waste to K-25 Site for storage and treatment at the Toxic Substances Control Act (TSCA) Incinerator; continue operation, maintenance, and surveillance of hazardous waste storage facilities; continue collection and transportation of hazardous waste (about 56 m^3) at ORNL	$ 8,747
• Continue construction of portions of the Bethel Valley Federal Facility Agreement Upgrade, Project No. 94-E-602	1,556
• Prepare ORNL portions of annually required waste minimization report and Waste Management Plan and coordinate and provide support for pollution prevention activities	639
• Complete construction of the Sanitary Waste System Upgrade, Project No. 93-E-633, at ORNL to meet the National Pollution Discharge Elimination System permit in accordance with a consent decree issued under a lawsuit	180
• Complete construction of the Bethel Valley Liquid LLW Collection and Transfer System Upgrade, Project No. 88-R-830, and provide system safety analysis and operational procedures	3,067
• Initiate start-up and system testing of equipment affected by the Melton Valley Liquid LLW Collection and Transfer System Upgrade, Project No. 92-E-601	225
TOTAL, OAK RIDGE	$ 14,414

1992

WASTE MANAGEMENT - NON-DEFENSE

III. Performance Summary - Oak Ridge (cont'd)

Explanation of Funding Changes FY 1996 to FY 1997

- Funding increase is due to resumption of offsite shipment and treatment of hazardous waste.

Major Issues

- None

OHIO

I. Mission Supporting Goals and Objectives

The West Valley Demonstration Project (WVDP) is located at the Western New York Nuclear Service Center near West Valley, New York. The Center reprocessed SNF from 1966 to 1972. The purpose of the project is to demonstrate an integrated production scale project to vitrify 660,000 gallons of HLW. The most significant milestone is the commencement of vitrification operations currently scheduled for FY 1996 and completion of vitrification in 1998. The benefit of this project is the conversion of a liquid waste form into a more stable solid waste form amenable to long term storage pending development of a geologic repository.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
West Valley Demonstration Project	$124,902	$115,389	$123,601	$ +8,212	+7%
TOTAL, Ohio	$124,902	$115,389	$123,601	$ +8,212	+7%

III. Performance Summary

FY 1995 Accomplishments:

- Successfully completed six years of pretreatment operations at the West Valley Demonstration Project.
- Completed transfer and wash of acid waste.
- Completed melter warm-up.
- Initiated zeolite mobilization and transfer.
- Completed construction of Vitrification Facility/NOX Facility.

FY 1996 Accomplishments (To Date and Planned):

- Complete vitrification facility non-radioactive testing.
- Conduct DOE Operational Readiness Review for the Vitrification facility.
- Begin vitrification radioactive tie-ins in April 1996.
- Complete production of the first radioactive canister in June 1996.
- Publish Phase II Draft Environmental Impact Statement (EIS).

III. Performance Summary - Ohio (cont'd)

FY 1997 Planned Accomplishments:

• Operate site safely and compliantly; publish Phase II EIS Record of Decision	$ 76,801
• Solidify about 120 canisters of liquid High-Level Waste	46,800
TOTAL, OHIO	$123,601

Explanation of Funding Changes FY 1996 to FY 1997

- Increase in FY 1997 budget provides for increase in production of radioactive waste canisters, from 30 canisters in FY 1996 to a full year's production of 120 canisters in FY 1997.

Major Issues

- None

RICHLAND

I. Mission Supporting Goals and Objectives

The Battelle Memorial Institute provides science and technology laboratory services to the Hanford Site at the Pacific Northwest Laboratory (PNL). Hot cells there are used for a variety of radioactive analyses required by on and offsite missions, including cesium and strontium isotope capsules. The FY 1997 funding will continue routine waste management operations and the cleanout and restoration activities of the 324-B Cell. The 324-B cleanout activities includes remote disassembly of highly contaminated equipment and the packaging of highly radioactive debris for storage and disposal.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Facilities Operations and Maintenance	$ 18,178	$ 11,550	$ 11,506	$ -44	0%
TOTAL, Richland	$ 18,178	$ 11,550	$ 11,506	$ -44	0%

III. Performance Summary

FY 1995 Accomplishments:

- Cleared 74 percent of the B-Cell floor area through activities such as removing turntables, and constructing temporary full storage systems.

FY 1996 Accomplishments (To Date and Planned):

- 324 B-Cell floor area will be 80 percent cleared through cleanup activities such as removing fuel thimble storage rack and removing the 1A rack.

FY 1997 Planned Accomplishments:

• Will clear 88 percent of dispersable contamination from B-Cell floor area through various ongoing activities	$11,506
TOTAL, RICHLAND	$11,506

1966

III. Performance Summary - Richland (cont'd)

3b. A-E Work (Title I and II) Duration: 6 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- None.
Total Project Cost (TPC) -- None

4a. Date Physical Construction Starts: 1st Qtr. FY 1998

4b. Date Construction Ends: 4th Qtr. FY 1998

6. Current Cost Estimate:
TEC -- $ 3,210
TPC -- $ 3,490

7. Financial Schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1997	$ 360		$ 360	$ 360
1998	2,850		2,850	2,850

8. Project Description, Justification and Scope

The proposed ANL-W Waste Handling Facility (WHF) will be located at the north end of the site, east of the Northgate Road extension, west of the earth and rubble mound. The facility will contain a hazardous waste storage area; a contact-handled radioactive waste storage area; a municipal sanitary waste (cold waste) sorting area; an excess items (non-radioactive, non-hazardous) storage area; and offices.

1975

8. Project Description, Justification and Scope (continued)

A centralized waste handling facility is necessary to ensure compliance of ANL-W methods to waste collection, storage, and disposal requirements imposed by the Department of Energy, federal and state regulations. Waste handling operations are currently scattered throughout the site in various facilities, temporary trailers, and outside storage areas. There is no waste handling facility available that provides the necessary storage and handling functions. The proposed facility will streamline all waste routes, minimizing both shipments and waste generation. Additionally, it will provide properly designed areas for storage of wastes awaiting shipment and a monitoring and packaging facility for solid and hazardous wastes.

Because of lack of space, there is no other area available for the categorization and storage of wastes generated by ANL-W operations. The only alternative to this facility would be to handle wastes generated by ANL-W operations under the existing program, which allows the opportunity for wastes to be improperly placed into the wrong waste stream, to exceed allowable storage time prior to disposal, and to be stored in areas not in compliance with state and federal regulations. While hand surveying items to detect radiation is currently being performed on all wastes leaving the site, this process is very labor intensive, time consuming, and not as accurate as the methods provided with this facility. This facility will allow all but large items (such as construction debris) to be surveyed using specialized, sensitive detection apparatus. This relieves the Health Physics personnel from the burden of hand surveying typical office wastes and increases the accuracy of detection. The personnel sorting the wastes will be trained to identify wastes that should not be allowed to enter the landfill, such as recyclable (including batteries) and hazardous wastes that were improperly disposed.

The 7,000-gross-square-foot WHF will provide a 90-day storage area conforming to specific requirements set forth in 40 CFR 262.34 for storage of Resource Conservation and Recovery Act (RCRA) hazardous wastes and 40 CFR 761.65(b) for storage of Toxic Substance Control Act (TSCA) PCB wastes, as well as other hazardous materials controlled by state and federal regulations. The WHF will allow monitoring of all cold waste generated at ANL-W for radioactive contamination and presence of hazardous materials. The WHF will also provide a facility for sorting waste to recover recyclable materials offices to maintain records for the receipt and shipment of all wastes through the WHF.

The proposed WHF will have an overall size of 160 ft. long, 40 ft. wide, with a 16 ft. extension in back and 14 ft. eave height. The building will be designed to meet the requirements of the Uniform Building Code (UBC), DOE Order 6430.1A (General Design Criteria), and National Fire Protection Association Codes NFPA 101 and NFPA 30. Storage for RCRA/TSCA waste will meet the requirements set in 40 CFR 262.34 and 40 CFR 761.65(b).

2a. Project No.: 97-E-600
2b. Construction Funded

8. Project Description, Justification and Scope (continued)

The WHF will provide for enclosed storage of RCRA/TSCA hazardous wastes, items and materials designated as excess, and contact-handled radioactive waste pending shipment from the ANL-W site. In addition, the facility will provide for monitoring municipal sanitary solid waste for radioactive contamination and presence of hazardous waste destined for the landfill. Outside storage space will be available for storage of scrap metal and wood, antifreeze and used oil.

Additional building space is proposed to provide storage area for surveyed excess items and radioactive wastes pending shipment. The additional space required for storing the excess items would not require equipment purchases or special considerations. The portion of the WHF designated to store radioactive materials will require a solid block shield wall to minimize radiation exposure levels in the facility.

1. Improvements to land	260	
2. Buildings	990	
3. Other structures	0	
4. Utilities	720	
5. Special facilities	30	
d. Standard equipment		290
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
Subtotal		$ 2,720
h. Contingencies at approximately 18 percent of above costs		490
i. Total line item cost (section 12, a. 1. (a)		$ 3,210
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$ 3,210

10. Method of Performance

Title I design, Title II facility design, and Title III design services will be performed by an Architect-Engineer under a negotiated fixed-price contract. The construction will be performed by a construction contractor who will be selected by competitive bids using the Title II drawings and specifications to obtain a single-fixed price construction contract. ANL-W will administer the A/E contract, the construction contract, engineering support services and construction inspection.

1981

1. Title and Location of Project: Bethel Valley Federal Facility Agreement Upgrade, Oak Ridge National Laboratory, Oak Ridge, Tennessee

2a. Project No. 94-E-602
2b. Construction Funded

8. Project Description, Justification and Scope

The proposed project will upgrade a portion of the existing Bethel Valley liquid low-level waste (LLW) collection and transfer (CAT) system at Oak Ridge National Laboratory (ORNL) with the best available technology in a cost effective manner, which will protect personnel, public safety and health, and the environment while meeting all applicable regulations, including the FFA, as it supports the Laboratory's research mission. Since ORNL's beginning in the early 1940's, its primary mission has been the support of the Department of Energy's (DOE) programs involving radioactive materials. This effort is expected to continue and grow during the next 50 years and beyond. The LLW system and its CAT component are essential to that effort and, if not kept in operation, will significantly affect ORNL's capabilities for successfully fulfilling that mission.

Currently, portions of the existing LLW-CAT system are still constructed of 40-year-old technology, which is rapidly deteriorating. More than 30 contaminated leak sites have been documented against the existing system, most of those occurring in the last 10-15 years of operation. The most notable incident occurred January 23, 1985, with a release of Sr-90 into the Sewage Treatment Plant. Several days later, the concentration of Sr-90 at White Oak Dam increased by a factor of 3, exceeding the DOE average monthly limit. After an intensive two-month effort to locate the source of contamination, a broken LLW pipeline was discovered at the Manipulator Repair Facility with a 7-foot-deep hole directly underneath the breakpoint. This type of accident is typical of those expected to occur at an increasing rate as the system gets older and deterioration continues. Hence, this project is urgently needed to continue the upgrades and stop the recurring leaks of low-level waste with their potential for adverse safety, health, and environmental impact.

During the 1970s and 1980s and continuing into the 1990s, the number of regulations have increased dramatically in the areas of radioactive and hazardous waste management. In late 1977/early 1978, the Clean Water Act (CWA) was issued by the federal government and the Water Quality Control Act was issued by the State of Tennessee. These acts complement each other and basically require that discharges of pollutants into public waters be eliminated. In April 1985, DOE issued Order 5480.14 requiring that its operating contracts implement the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) program. This DOE order requires: (1) the identification and quantification of the presence of hazardous substances that may cause an unacceptable risk to health, safety, and environment; (2) the establishment and implementation of a plan for eliminating sources of contamination and completing the remedial actions necessary for cleanup; and (3) verifying that the actions taken have been successful. In addition, DOE Order 5480.14, addresses the Resource Conservation and Recovery Act (RCRA), and the Clean Water Acts (CWA) which also apply.

1982

1. Title and Location of Project: Bethel Valley Federal Facility Agreement Upgrade, Oak Ridge National Laboratory, Oak Ridge, Tennessee	2a. Project No. 94-E-602 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

DOE, EPA, and TDEC have developed criteria for upgrading the LLW-CAT system. These criteria are, in most respects, the same as EPA's requirements for hazardous waste storage and treatment systems defined in the RCRA. These criteria, promulgated under 40 CFR Parts 260-266 and 270 requires double containment, active leak detection, and corrosion protection of critical contact surfaces. The FFA has been negotiated among the DOE, the EPA and the TDEC and became effective January 1, 1992. It establishes firm schedules for compliance with the applicable regulations. Failure to comply with the schedule will result in a system shutdown.

The proposed project will eliminate additional sources for leaks of low-level waste with their potential for adverse safety, health, and environmental impacts. It will bring the affected facility LLW-CAT into compliance with applicable regulations and will facilitate fulfillment of the FFA. These upgrades involve the replacement of single-wall with double-wall piping and sump liners, addition of drip trays, upgraded leakage detection and control instrumentation, and the addition of a new valve pit.

The scope of the project was defined by the need to use the "best available technology" and provide service to only those critical facilities which offer significant benefits to ORNL and DOE. The chosen technology has been used at ORNL in the same application for almost 10 years with excellent results. Only those facilities that could justify a strong need for continued LLW-CAT pipeline service were included in the scope.

FY 1997 funding will be used to continue procurement and continue construction activities.

A-E work was completed in the 3rd quarter of FY 1995.

i. Total line item cost (section 12, a. 1. (a)		$22,000
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$22,000

1984

a/ The cost estimate is based on conceptual design completed in June 1992 at a cost of $730,000. The cost estimate was updated in March 1995 to reflect cost and schedule impacts resulting from reduced FY appropriation request due to budget constraints. The DOE Headquarters Economic Escalation Indices for Construction Projects were used as appropriate over the project cycle.

b/ Construction costs include approximately $345,000 for readiness reviews.

1. Title and Location of Project: Bethel Valley Federal Facility Agreement Upgrade, Oak Ridge National Laboratory, Oak Ridge, Tennessee	2a. Project No. 94-E-602 2b. Construction Funded

10. Method of Performance

DOE-ORO will provide overall project management.

Design will be performed under a negotiated architect-engineer contract and inspection will be performed by the operating contractor. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding administered by the construction manager.

(5) GPP or other construction related to the programmatic effort in the facility	0
(6) Utility costs	2
(7) Other costs	20
Total related annual funding	$ 200

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

(1) Total facility costs

(a) Line item--Design, procurement, and construction of the Bethel Valley FFA Upgrade are estimated to be $22,000,000. This includes approximately $345,000 for readiness reviews in accordance with DOE Order 5480.31.

(b) PE&D--None.

(c) Expense-funded equipment--None.

(d) Inventories--None.

(e) Non-Federal contribution--None.

(2) Other project costs

(a) R&D necessary to complete construction--None.

(b) Conceptual design--The conceptual design was completed in June 1992 at an approximate cost of $730,000. This includes preparation of a Project Safety Assessment (SA).

(c) Decontamination & decommissioning (D&D)--None.

(d) NEPA documentation costs--Costs for NEPA documentation and activities are estimated to be $100,000.

(e) Other project related costs--Costs of $15,000 for site characterization activities are included. Other project related costs of $2,665,000 include activities associated with requirements definition, project validation, readiness reviews, Project Management Plan, QA planning and other miscellaneous supporting project documents.

(f) Non-Federal contribution--None.

1. Title and Location of Project: Bethel Valley Federal Facility Agreement Upgrade, Oak Ridge National Laboratory, Oak Ridge, Tennessee

2a. Project No. 94-E-602
2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding

(1) Facility operating costs--The annual costs to operate and maintain the system is estimated at $100,000, including personnel, operational sampling and analysis, health physics, industrial hygiene and quality inspection.

(2) Facility maintenance and repair costs--The annual costs of $38,000 are for facility maintenance and repairs as required.

(3) Programmatic operating expenses directly related to the facility--The additional annual programmatic expenses of $20,000 includes the cost of personnel needed for performance tracking and reporting, and budgeting.

(4) Capital equipment not related to construction but related to the programmatic effort in the facility--Capital equipment in support of the BV FFA is estimated to cost approximately $20,000 for replacement equipment and upgrades necessary to meet changing environmental, industrial safety, and health and safety requirements.

(5) GPP or other construction related to programmatic effort--None.

(6) Utility costs--Annual costs of $2,000 are included for utilities.

(7) Other costs--Funding of $20,000 is for miscellaneous costs which are not covered above.

1988

1. Title and Location of Project: Rehabilitation of Waste Management Building 306, Argonne National Laboratory (ANL), Argonne, Illinois

2a. Project No.: 91-E-600
2b. Construction Funded

8. Project Description, Justification and Scope

The purpose of this project is to create a facility which will conform to all waste handling regulations, support safe work conditions, increase the efficiency of waste management operations, and support the expected growth in waste management operations.

The work of this project consists of a full rehabilitation of Building 306 within the existing building footprint with the exception of a small enclosure along the north and east portion of the building and the addition of a shipping dock at the east end of the building. The project will involve all construction disciplines. The rehabilitation is planned in two phases. Phase I will address the dry low-level radioactive waste (dry LLW) processing area located at the northeast corner of the building. The north dock will be enclosed to provide needed space for dry LLW processing. The lay out of this area will be changed to allow for increased efficiency in waste management operations. Processes having to do with sorting and compaction of dry LLW will be relocated from other areas of the building to the dry LLW processing area. HVAC upgrades, fire protection upgrades, and life safety egress concerns in this area will be addressed. The emergency diesel generator will also be replaced as part of Phase I.

Phase II will address the remaining rehabilitation of Building 306. The primary areas to be addressed include the following: the office/administrative area, the liquid radwaste processing area, the processing area lockers/showers/toilets and the general dry radwaste operations area. Decontamination will be required in many areas of the building prior to both Phase I and Phase II construction. A decommissioned evaporator/concentrator formerly used for treatment of liquid wastes will be decontaminated and demolished.

Site improvement tasks planned in this project include addition of a shipping dock to the east end of the building and the expansion of the personal access and vehicular access to the building.

The original portion of Building 306 was constructed in 1950 during the first major construction program at this site (gross area 13,500 sq. ft.). In 1961, an addition was constructed more than doubling the area of the building (gross area 25,800). The facility has functioned as the basic Waste Management Building for the entire site to the present day. Minor rehabilitation has been effected as necessary to maintain operations. Shower, toilet, locker and other support facilities are now insufficient, partly due to removal of restrictions prohibiting female waste management workers. Electrical systems are fully loaded and offer little flexibility for further modification. Much of the liquid waste piping system and associated pumps require replacement. The locations of certain waste processing operations result in significant inefficiencies. Facilities are required to support additional waste processing equipment to be purchased in the next few years.

1989

1. Title and Location of Project: Rehabilitation of Waste Management Building 306, Argonne National Laboratory (ANL), Argonne, Illinois

2a. Project No.: 91-E-600

j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$11,274

10. Method of Performance

The operating contractor will provide project management and oversight of all consultant and construction contractor activity. The project will be accomplished in two phases to be performed under separate design and construction contracts.

Phase I will be performed according to a design/build approach with design and construction work procured under one fixed-price contract. For Phase II, a fixed-price contract will be negotiated for facility design through quality based selection procedures. A separate fixed price, competitively bid contract will be established for Phase II construction.

ANL staff may be used to perform Safety Analysis Report work.

Total related annual funding	$ 280

1991

1. Title and Location of Project: Rehabilitation of Waste Management Building 306, Argonne National Laboratory (ANL), Argonne, Illinois

2a. Project No.: 91-E-600
2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--Complete rehabilitation of an existing 40,000 sq.ft. waste management facility with addition of a small enclosure at the northeast corner of the building and of a shipping dock at the east end of the building. Prior to construction, in many of the building areas, decontamination will be required to achieve unrestricted occupancy. The ventilation, fire suppression, electrical, and signal systems require replacement of upgrading to present standards. Pumps and piping in the liquid radwaste storage area require replacement.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
      (e) Non-Federal Contribution--None.

   (2) Other project costs
      (a) R&D necessary to complete construction--None.
      (b) Conceptual design--Conceptual design is complete.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--Environmental Assessment is complete. Funded in FY 1995 operating funds.
      (e) Other project related costs--None.
      (f) Non-Federal contribution--None.

b. Related annual funding
   (1) Facility operating costs--The operating costs listed are the approximate current costs, on a square foot basis. There will be a short term (three to five years) decrease in maintenance costs due to the rehabilitation work, then a gradual return to the current cost levels. There may be a reduction in energy costs due to new equipment, improved lighting efficiency and improved enclosure features.
   (2) Facility maintenance and repair costs--None.
   (3) Programmatic operating expenses directly related to the facility--None.
   (4) Capital equipment not related to construction but related to he programmatic effort in the facility--None.
   (5) GPP or other construction related to programmatic effort--None.
   (6) Utility costs--None.
   (7) Other costs--None.

a/ Congressionally mandated rescission.
b/ Use of $4,103,000 prior year funds for FY 1996 uncosted offset.

1993

1. Title and Location of Project: Bethel Valley Liquid Low-Level Waste Collection and Transfer System Upgrades, Oak Ridge National Laboratory, Oak Ridge, Tennessee	2a. Project No.: 88-R-830 2b. Construction Funded

8. Project Description, Justification and Scope

The proposed project will upgrade a portion of the existing Bethel Valley liquid low-level waste (LLLW) collection and transfer (CAT) system at Oak Ridge National Laboratory (ORNL) with the best available technology in a cost effective manner which will protect personnel, public safety and health, the environment and meet all applicable regulations as it supports the laboratory's research mission. Since its beginning in the early 1940's, a primary mission of the ORNL has been the support of the Department of Energy's (DOE) programs involving radioactive materials. This effort is expected to continue and grow during the next 50 years and beyond. The LLLW system and its CAT component are essential to that effort and, if not kept in operation, will significantly affect ORNL's capabilities for successfully fulfilling that mission. The LLLW-CAT system is an extensive underground piping system which transfers low-level radioactive liquid waste from the waste generating and processing facilities to an evaporator facility for volume reduction.

Currently, the majority of the existing system is constructed of 40-year-old technology. More than 30 contaminated leak sites have been documented against the existing system, most of those occurring in the last 10-15 years. The most notable incident occurred January 23, 1985, with a release of radioactive isotopes into the Sewage Treatment Plant. Several days later, the concentration at White Oak Dam increased by a factor of 3, exceeding the DOE average monthly limit. After an intensive two-month effort to locate the source of contamination, a broken LLLW pipeline was discovered at the Manipulator Repair Facility with a 7-foot-deep hole directly underneath the breakpoint. This type of accident is typical of those expected to occur at an increasing rate as the system gets older and deterioration continues. Hence, this project is urgently needed to stop the recurring leaks of low-level waste with their potential for adverse safety, health, and environmental impact.

During the 1970's and 1980's and continuing into the 1990's, the number of regulatory requirements have increased dramatically in the areas of radioactive and hazardous waste management. In late 1977/early 1978, the Clean Water Act (CWA) was issued by the federal government and the Water Quality Control Act was issued by the state of Tennessee. These acts complement each other and basically require that discharges of pollutants into public waters be eliminated. In April 1985, DOE issued Order 5480.14 requiring that its operating contractors implement the DOE Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) program. This DOE Order requires: (1) the identification and quantification of the presence of hazardous substances that may cause an unacceptable risk to health, safety, and environment; (2) the establishment and implementation of a plan for eliminating sources of contamination and completing the remedial actions necessary for cleanup; and (3) verifying that the actions taken have been successful.

1. Title and Location of Project: Bethel Valley Liquid Low-Level Waste Collection and Transfer System Upgrades, Oak Ridge National Laboratory, Oak Ridge, Tennessee	2a. Project No.: 88-R-830 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The Environmental Protection Agency (EPA) and the Tennessee Department of Environment and Conservation (TDEC) have developed criteria for upgrading the LLLW-CAT system. These criteria are, in most respects, the same as EPA's requirements for hazardous waste storage and treatment systems defined in the Resource Conservation and Recovery Act (RCRA). These criteria were promulgated under 40 CFR Parts 260-266 and 270 and require double containment, active leak detection, and corrosion protection of critical contact surfaces. A Federal Facilities Agreement (FFA) negotiated among the DOE, the EPA, and the TDEC will establish schedules for complying with the regulations soon. Failure to comply with the schedule will result in a system shutdown, and may result in enforcement actions and penalties assessed by state and federal regulatory agencies.

The proposed project includes approximately one mile of 2-inch and 3-inch doubly contained stainless steel pipeline with approximately five stainless steel tanks of nominal 1,000-gal capacity located in underground stainless-steel-lined concrete vaults. The pipelines are equipped with an active leak detection system which utilizes pressurized nitrogen and are cathodically protected against corrosion. The tanks have provisions for flow control, pH monitoring, and temperature monitoring and will be equipped with an automatic caustic addition system for pH neutralization. Local monitoring and control stations (MCSs) will be provided and integrated with the existing Waste Operations Control Center (WOCC) to provide monitoring and control of overall CAT system operation.

The project will also provide a new central facility for receiving and discharging to the pipeline system liquid low-level radioactive waste that is transported by truck in tanks and small bottles. This Transported Waste Receiving Facility (TWRF), Building 2649, will be a single-story building (approximately 4,000 square feet) of standard construction located near the evaporator facility. The facility will have provisions for discharging the tank trucks within contained and ventilated rooms and glove boxes for discharging the small bottles of LLLW. Facility features will include diked floors, suitable piping and tankage, glove boxes, and appropriate ventilation and handling equipment to assure operator safety and environmental compliance. The TWRF includes one LLLW tank and one process waste tank which are equivalent to an MCS.

Internal piping will be upgraded and new external piping and an MCS will be provided for the Radioactive Materials Analytical Laboratory. Internal piping will be upgraded and new external piping and an MCS will be provided for the Irradiation Fuels Examination Laboratory. New external piping and internal piping utilizing a new tank will be provided for the Central Offgas Facility and other buildings as necessary. New LLW upgrade for building for research on irradiated materials to include internal double wall piping; external double wall piping; central instrumentation modification; decontamination to provide access.

1995

1. Title and Location of Project: Bethel Valley Liquid Low-Level Waste Collection and Transfer System Upgrades, Oak Ridge National Laboratory, Oak Ridge, Tennessee	2a. Project No.: 88-R-830 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

The proposed project will eliminate leaks of low-level waste with their potential for adverse safety, health, and environmental impacts. It will bring the affected facility LLLW-CAT into compliance with applicable regulations and will facilitate fulfillment of the FFA, thereby averting a system shutdown with its resultant adverse effects on DOE research programs.

The scope of the project was defined by the need to use the "best available technology" and provide service to only those critical facilities which offer significant benefits to ORNL and DOE. The chosen technology has been used at ORNL in the same application for almost 10 years with excellent results. Only those facilities that could justify a strong need for continued LLLW-CAT pipeline service were included in the scope.

FY 1997 funding will be used to continue work on Phase II including decontamination and construction activities.

As described for FY 1994 the TEC of this project has increased $30,000,000 from the original estimate. The increase resulted from reinstatement of scope, implementation of rulemaking, increased regulatory rigor, implementation of a construction manager, design delays, schedule extension (the construction end date has changed from the 4th quarter FY 1991 to the 4th quarter of FY 1997), complications during decontamination, and accounting procedure changes requiring portions of decontamination and Readiness Reviews be funded by the project. Current project planning and associated documentation reflects these changes.

As described for FY 1994 procurement of a tanker truck was deleted from the project scope due to changing needs at the ORNL. Remaining in the project scope is a truck to provide bottle transportation to the TWRF from low volume waste generators at the ORNL.

1996

1. Title and Location of Project: Bethel Valley Liquid Low-Level Waste Collection and Transfer System Upgrades, Oak Ridge National Laboratory, Oak Ridge, Tennessee

2a. Project No.: 88-R-830

2b. Construction Funded

9. Details of Cost Estimate a/

	Item Cost	Total Cost
a. Design and Management costs		$ 15,830
1. Engineering design and inspection at approximately 22 percent of construction costs, Item c (Design, Drawings, and Specifications: $4,600,000)	$ 9,890	
2. Construction Management Costs	2,510	
3. Project management at 8 percent of construction costs (item c)	3,430	
b. Land and land rights		0
c. Construction costs b/		43,980
1. Improvements to land	0	
2. Buildings	0	
3. Other structures	0	
4. Utilities	0	
5. Special facilities	43,980	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		1,550
Subtotal		$ 61,360
h. Contingencies at approximately 6 percent of above costs		3,640
i. Total line item cost (section 12, a. 1. (a)		$ 65,000
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$ 65,000

a/ The estimated cost is based on current project cost estimates and the conceptual design report addendum submitted in July 1992. The DOE Headquarters Economic Escalation Indices for Construction Projects were used as appropriate over the project cycle.

b/ Construction costs include $200,000 for readiness review.

1997

1. Title and Location of Project: Bethel Valley Liquid Low-Level Waste Collection and Transfer System Upgrades, Oak Ridge National Laboratory, Oak Ridge, Tennessee

2a. Project No.: 88-R-830

2b. Construction Funded

10. Method of Performance

DOE-ORO will provide overall project management.

Design and inspection will be performed under negotiated architect-engineer contract and by the operating contractor. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding administered by the construction manager.

11. Schedule of Project Funding and Other Related Funding Requirements

(7) Other costs	$ 800
Total related annual funding	

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

(1) Total facility costs

(a) Line item--Costs for design, procurement, and construction of the Bethel Valley Liquid Low-Level Waste (BVLLW) Collection and Transfer System Upgrade are estimated to be $65,000,000. This includes decontamination for the upgrades associated with FFA portion of the project and it also includes $200,000 for readiness review.

(b) PE&D--None.

(c) Expense-funded equipment--None.

(d) Inventories--None.

(e) Non-Federal contribution--None.

1999

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

(2) Other project costs
- (a) R&D necessary to complete construction--None.
- (b) Conceptual design--Includes $800,000 spent in FY 1987 and 1988 on preparing the design criteria and advance procurement report. The total conceptual design cost is $650,000. Conceptual design was completed in February 1986 at a cost of $600,000. The CDR addendum cost was $50,000 in FY 1992.
- (c) Decontamination & decommissioning (D&D)--Decontamination costs for Phase I were paid for using expense funds and amounted to approximately $2,100,000. Decontamination costs for Phase II work are included in the capital cost estimate.
- (d) NEPA documentation costs--The required NEPA documentation was a memorandum to file (MTF) that was prepared at a cost of about $45,000.
- (e) Other project related costs--The projected cost of $3,105,000 over the life of the project is for site characterization, preparing project support documents not covered in the above costs and expense funded program management support and coordination related to the project. The project documentation includes safety documentation, management plans, readiness reviews before capital funding is received, the value engineering study, risk assessments, and quality assurance plans.
- (f) Non-Federal contribution--None.

b. Related annual funding
- (1) Facility operating costs--The additional annual estimated costs of $300,000 to operate the Bethel Valley Liquid Low-Level Waste (BVLLLW) system includes personnel, utilities, operational sampling and analysis, health physics, industrial hygiene, and quality assurance.
- (2) Facility maintenance and repair costs--It is estimated that approximately $220,000 will be required for maintenance and repairs. This includes both labor and materials costs.
- (3) Programmatic operating expenses directly related to the facility--The additional annual programmatic expenses of $80,000 related to the BVLLLW system includes the cost of personnel needed for performance tracking and reporting, and budgeting.
- (4) Capital equipment not related to construction but related to the programmatic effort in the facility--Approximately $80,000 will be required on an annual basis to replace and upgrade equipment.
- (5) GPP or other construction related to programmatic effort--This line item project does not require any stand-alone, FFA-related GPPs in order for the project to successfully achieve its purpose.
- (6) Utility costs--The annual cost of utilities is estimated to be about $40,000.
- (7) Other costs--Approximately $80,000 will be required for miscellaneous costs which are not covered above.

END PHASE I OF PROJECT. ADDITIONAL OUTYEAR FUNDS FOR PHASE II ARE NOT YET KNOWN.

2001

1. Title and location of project: West Valley Demonstration Project, West Valley, New York	2a. Project No.: a/ 2b. Operating Funded

7. Financial schedule (Federal Funds) (continued) d/

a/ Completion date is through the completion of high-level waste solidification (Phase 1), which occurs in 3rd Qtr FY 1998. The total DOE share through Phase I of $1,366,000,000 occurs in 3rd Quarter of FY 1998. Completion date and total cost for the Phase II portion of the project has not been determined.

b/ Does not include Phase II costs (e.g., EIS activities, transportation, final decontamination and decommissioning activities also excludes FSFCA costs).

c/ Phase II costs include post-solidification operating, high-level waste storage and transportation, and final decontamination and decommissioning activities. A definitive estimate for the post-solidification phase (e.g., waste storage and transportation and final decontamination and decommissioning) will be prepared after coordination with the Nuclear Regulatory Commission and the State of New York and preparation of appropriate environmental documents. Project has requested $128,150,000 through 3rd Quarter FY 1998 for scopes associated with Phase II, Federal Facilities Compliance Act, Federal/State Facility Compliance Agreement (FSFCA), and RCRA3008 (h) Administrative Order on Consent.

d/ It should be noted that this project is justified as an operating expense funded construction project. It has been reformatted only to comply with the revised DOE Order 5100.3. It is not intended to be funded as a capital line item.

e/ Reflects a reduction of $1,574,000 as a general reduction mandated by Congress in the FY 1993 Appropriation language and a reduction of $4,000,000 due to use of prior year balances per FY 1994 Appropriation Committee mark.

f/ Reflects rescission of $3,654,000 for FY 1994.

g/ Reflects net reduction of $3,873,000 of which $2,300,000 for General Reduction and Reprogramming.

h/ Reflects reduction of $4,000,000 for General Reduction.

8. Project Description, Justification and Scope

On October 1, 1980, Public Law 96-368, the West Valley Demonstration Project Act, (WVDP Act) went into effect. This Act directed the Secretary of Energy to carry out a high-level radioactive waste management demonstration project at the Western New York Nuclear Service Center (WNYNSC) located in Cattaraugus County, near West Valley, New York. The WNYNSC is owned by the State of New York and is administered by the New York State Energy Research and Development Authority (NYSERDA).

1. Title and location of project:	West Valley Demonstration Project, West Valley, New York	2a. Project No.: a/ 2b. Operating Funded

8. Project Description, Justification and Scope (continued)

The WNYNSC reprocessed nuclear fuel from 1966 to 1972. During that time, approximately 660,000 gallons of alkaline high-level waste was generated by this activity and stored in a carbon steel tank located in an underground vault. The alkaline waste is similar to that stored at the Department's Savannah River and Hanford sites in that these wastes also consist of a supernatant liquid and a sludge that has formed on the tank bottom. A smaller amount (about 12,000 gallons) of acidic Thorex waste, stored in a stainless steel tank located in a separate underground concrete vault, will also be treated. The project scope includes all activities undertaken in carrying out the solidification, including: (1) preparation of the Center's premises and facilities to accommodate the solidification project, including such decontamination of existing facilities and equipment as may be necessary or appropriate; (2) removal of the wastes from the underground storage tanks; (3) development, design, construction, and operation of systems and necessary supporting facilities for the solidification of the wastes; (4) acquisition of containers for the permanent disposal of the solidified waste; (5) temporary storage of the solidified waste followed by transportation to an appropriate Federal repository for permanent disposal; (6) decontamination and decommissioning (D&D) of the waste tanks and facilities, material and hardware used in carrying out the solidification of the wastes; and (7) disposal of low-level and transuranic wastes produced from project activities.

Solidification of the HLW in borosilicate glass to produce a durable, solid waste form for permanent disposal is currently scheduled to begin in FY 1996. This activity will result in the generation of approximately 300 glass filled stainless steel canisters to be stored at the Project until a Federal repository is available.

It should be noted that this project is justified as an operating expense funded Construction Line Item Project. Operating expense funds will be used to fund development, design, construction, site/facility operation, and decontamination and decommissioning activities associated with the project.

2003

1. Title and location of project:	West Valley Demonstration Project, West Valley, New York	2a. Project No.: a/ 2b. Operating Funded

9. Details of Cost Estimate

The costs shown are based on planned expenditures through 3rd Quarter FY 1998. These current estimates were developed based on an approved estimate, consider currently available and projected resources, and include the following types of costs associated with the West Valley project: R&D, design, construction, waste immobilization, decontamination and decommissioning of existing hot cells for project reuse, site/facility operation and maintenance, and project management. Also, included are estimates for new scopes associated with compliance with DOE orders and regulations in the safety and environmental areas. In addition, estimated costs for Phase II, EIS, RCRA 3008(h) Administrative Order on Consent, FFCA, and FSFCA through 3rd Quarter FY 1998 have also been included.

	Total Cost (in thousands)
Phase I:	
High-Level Waste Solidification	$ 442,500
Decontamination and Decommissioning	18,450
Site Operations	343,750
Project Support	189,550
Low-Level, Hazardous, and TRU Waste Management	257,200
Capital Equipment	1,200
General Plant Projects	1,500
Total DOE Cost Estimate	1,254,150
Non-DOE Cost (New York State Funding)	106,000
Total Project Cost	$ 1,360,150

2005

1. Title and location of project: West Valley Demonstration Project, West Valley, New York

2a. Project No.: a/
2b. Operating Funded

10. Method of Performance (continued)

(b) Management and Contracting

The project is managed for the Department by an onsite project office, reporting through the Ohio Field Office, which is responsible for the day-to-day management and decision making. An operating contractor West Valley Nuclear Services Company, Inc., (a wholly owned subsidiary of Westinghouse Electric Corporation) is responsible for the technical management of the high-level waste solidification related activities, site and facility operations, and decontamination and decommissioning. Approval by the Department's Field, Project and Headquarters Officers is required on matters affecting project policies and technical, cost and schedule baselines. The State of New York through the New York State Energy Research and Development Authority provides consultation and comment on project activities to the Department as required by the West Valley Demonstration Project Act and the cooperative agreement between the Department and the Authority. The Nuclear Regulatory Commission provides the Department with informal review and consultations with respect to any potential radiological danger to public health and safety that may be presented by the project. An architect/engineering (A/E) firm (Ebasco Services, Inc.) has been selected by the operating contractor to perform miscellaneous A/E services; the Department reviewed and approved the selection process and contract terms. The architect-engineer scope of work generally includes preliminary and final design. To the extent feasible, design, procurement, construction, and inspection will be by fixed-price contract and subcontracts awarded on the basis of competitive bids. However, due to the complexity of the work, it may be necessary to utilize cost plus fixed fee contracts for portions of the work. Award fee contracts will be used when justified. Contracting will be by the Department or the operating contractor, depending on the nature and scope of work. The project is supported by the Battelle Pacific Northwest Laboratory, Richland, Washington, for development activities required to adopt waste treatment and solidification technology for the specific West Valley situation.

(c) Prior Year Achievements (FY 1995)

Construction/checkout/testing of the NOx System and the Vitrification Facility was completed. The Waste Compliance Plan and Waste Qualification Report were approved and issued. Vitrification Facility subsystem testing was completed along with systems performance tests in preparation for remote integrated non-radioactive operations.

Site operations continued including support of Plant Operations, site maintenance and upgrades, environmental compliance and documentation, training and operational safety. Environmental and analytical laboratories operated in support of ongoing programs.

Thorex was transferred to tank 8D-2. Thorex, zeolite and high-level waste sludge were prepared for vitrification. Preparation of the Draft Environmental Impact Statement continued. Site environmental monitoring, RCRA 3008(H) and FSFCA actions continued.

2006

10. Method of Performance (continued)

(d) Current Year Achievements (FY 1996)

Complete final integrated non-radioactive testing on the vitrification facility and complete operational Readiness Reviews leading to approval for radioactive vitrification operations. Vitrification of the high-level waste begins.

Site operational support continues, including support services, maintenance, safety and environmental programs. Environmental and analytical laboratories operate in support of ongoing operations and vitrification processing. The EIS public review and comment resolution is completed.

(e) Budget Year Achievements (FY 1997)

High-Level Waste vitrification production campaign will continue. Site operational support including maintenance, safety and environmental programs will continue. Environmental and Analytical Laboratories will operate in support of vitrification processing. The Phase II ROD will be issued. HLW tank and plant stabilization activities will be initiated.

11. Schedule of Project Funding and Other Related Funding Requirements

Project Budget a/	Prior b/c/d/	FY1996	FY1997	FY 1998	FY 1999	Total
1. Operating Funded TEC Construction	206,000	0	0	0	0	206,000
2. Facility Other Operating	924,400	128,989	137,351	150,000	166 700	1,507,440
3. Total WVDP	1,130,400	128,989	137,351	150,000	166,700	1,713,440
4. DOE Funds	1,014,150	115,389	123,601	135,000	150,000	1,538,140
5. NYS Funds	116,250	13,600	13,750	15,000	16,700	175,300

a/ Data is actual and proposed budget authorization.
b/ Reflects a reduction of $1,574,000 as a general reduction mandated by Congress in the FY 1993 Appropriation language and a reduction of $4,000,000 due to use of prior year balances per FY 1994 Appropriation Committee mark.
c/ Reduction of $2,300,000 for Non-Defense General Reduction.
d/ Reflects $1,753,000 of current year funds for Productivity Savings.

1. Title and location of project: West Valley Demonstration Project, West Valley, New York	2a. Project No.: n/ 2b. Operating Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

High-Level Waste Solidification

This category provides for development, design, construction, and operating activities related to immobilization and preparation of the high-level waste for permanent disposal.

(1) Development - Includes confirmatory or prototype development program, including Component Test Stand and mockups. This activity is based on adapting existing technology from the base Nuclear Energy and Defense waste management program to meet specific West Valley requirements.

(2) Design - Includes conceptual, preliminary and final design, inspection services, system(s) acceptance testing, and facility startup.

(3) Building and structures - Includes modification and construction of facilities (e.g. Component Test Stand) for waste solidification and supporting system/activities, field offices, and storage sheds.

(4) Special Equipment - Includes waste removal, transfer, solidification, and other systems necessary to carry out the waste immobilization and supernatant treatment program.

(5) Operating - Includes labor and material costs, including steel canisters, for the waste processing operations.

Decontamination and Decommissioning

This category covers the planning, engineering, equipment, and operations necessary for project D&D. It provides for the initial decontamination to prepare contaminated areas and hot cells for reuse by the project.

Site Operations

This category includes site/facility operations, training, maintenance, restoration, and upgrades (e.g., electrical and water supply system, roads, roofs, etc.) necessary to support waste solidification, decommissioning, environmental and occupational safety and monitoring, security and safeguards requirements.

2008

1. Title and location of project:	West Valley Demonstration Project, West Valley, New York	2a. Project No.: a/ 2b. Operating Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

Project Support

This category provides for technical, administrative, and overall management control of the project. Activities performed support other project elements and include items such as cost/schedule control systems, project reports, quality assurance program, public communication program, records management, analytical chemistry, radiation safety and control for project safety monitoring, drafting, and estimating.

Low-Level, Hazardous and TRU Waste Management

This category includes the Supernatant Treatment System, Cement Solidification System, Liquid Waste Treatment System, and Drum Cell System for Low-level waste handling; size reduction and TRU Decon Facility and TRU Interim Storage Facility for handling of TRU waste generated from high-level waste handling and processing and in the decontamination and decommissioning of the process building, and the continued management of hazardous and mixed waste.

Capital Equipment

This category provides equipment used in initial site takeover operations and restoration activities, such as health physics and environmental monitoring instrumentation and equipment, decontamination and decommissioning tools and equipment, manipulators and hot cells lights, and analytical chemical laboratory equipment.

2009

NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE

PROGRAM MISSION

The Office of Nuclear Material and Facility Stabilization was established in July 1992 within the Office of Environmental Management (EM) to coordinate and oversee the orderly transition of contaminated installations/facilities from other program offices to EM, once these properties are determined to be surplus to their mission.

The Office of Nuclear Material and Facility Stabilization protects workers, the public, and the environment from exposure and contamination associated with radioactive and hazardous wastes and materials contained within these facilities. The majority of these surplus facilities were built for research purposes and were not designed for long-term storage of radioactive waste and materials. Many of these facilities have exceeded their design life and are in poor physical condition. Consequently, the surveillance and maintenance activities for these facilities and hazardous materials are expensive and labor intensive. To effectively deactivate the facilities, stabilize the materials, and reduce the funding requirements, an active program has been established for surplus facilities to identify, plan and accomplish projects that will properly store the materials and reduce the funding requirements. We are proposing legislation for privatization of facility deactivation, which will authorize contractor-financing of deactivation projects, with the contractor being paid from savings in maintenance cost to the government. This could greatly reduce the outyear maintenance mortgage for our facilities, which will otherwise be several billion dollars over the next five years, by enabling earlier facility deactivation than would be possible based on budgetary restrictions.

Milestones have been established for the stabilization of materials so that the most urgent risks are addressed first. Furthermore, as nuclear materials are placed in a more stable form, actions are being taken in a timely and cost-efficient manner as possible to stabilize and deactivate the contaminated surplus facilities. Examples of non-defense activities include defueling of the Fast Flux Test Facility reactor vessel at Richland; continuation of deactivating the Rover facility at Idaho; disposal of the non-process contaminated surplus buildings on the Idaho National Engineering Laboratory site; removal of spent nuclear fuel from the material Test Reactor at Idaho; and, disposal of surplus contaminated equipment in various buildings at Oak Ridge. It is envisioned that the mission of the Office of Nuclear Material and Facility Stabilization program mission can be completed in the 2005-2010 timeframe.

All maintenance and stabilization activities are conducted with full participation of involved stakeholders. The interests of stakeholder groups encompass environmental protection, individual safety and proper management of surplus facilities located close to large metropolitan areas. Their interests focus on activities with major facilities located in Idaho, Tennessee, Washington, and California.

2010

PROGRAM MISSION - NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE (Continued)

Some of the most noteworthy facilities and materials under the purview of the Office of Nuclear Material and Facility Stabilization include:

- o 3 nuclear reactors
- o 19 radioactive processing buildings
- o 260,000 gallons of radioactive liquid sodium
- o 100,000 gallons of liquid sodium
- o 17.3 tons of depleted uranium

The Spent Nuclear Fuel program (formerly within the Office of Waste Management) has been transferred to the Office of Nuclear Material and Facility Stabilization. The focus of this program is on placing all spent nuclear fuel into interim dry storage and preparing the fuel for permanent disposition.

The GOALS of the Nuclear Material and Facility Stabilization program are to:

- o Reduce risks:
  - -- by the timely deactivation of surplus, contaminated facilities.
- o Lower the mortgage cost of doing business.
- o Complete the mission of the Nuclear Material and Facility Stabilization program in FY 2005-2010.

Example of lowering the mortgage cost of doing business:

- o FY 1997 deactivation funding for the Fast Flux Test Facility is approximately $17,000,000. Continued deactivation activities at the facility will reduce the yearly surveillance and maintenance expenses for the facility from approximately $25,000,000 in FY 1997 to approximately $2,000,000 after deactivation activities are completed in FY 2002.

PERFORMANCE MEASURES:

The following performance measures are utilized by both Headquarters and field personnel to evaluate the effectiveness and efficiency of the accomplishments of the mission of the Nuclear Material and Facility Stabilization program:

- o Accomplish 100 percent of the FY 1997 nuclear material stabilization commitments and other risk reduction activities.
- o Accomplish deactivation projects within (or better than) cost and schedule baselines.
- o Reduce the total number and associated cost of surveillance and maintenance actions.
- o Accomplish 100 percent of established milestones.

PROGRAM MISSION - NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE (Continued)

FISCAL YEAR 1997 BUDGET STRUCTURE

The Office of Nuclear Material and Facility Stabilization's budget is structured in two appropriations. The first appropriation, the Defense Environmental Restoration and Waste Management, focuses on activities related to the management and stabilization of weapons related facilities. The second appropriation, Energy Supply, Research and Development, focuses on DOE activities independent of the weapons related program.

Within each appropriation, the Office of Nuclear Material and Facility Stabilization accomplishes its mission by supporting various activities to deactivate surplus, contaminated facilities. The Energy Supply, Research and Development appropriation funds activities in the following four categories:

1. Program Integration:

   Funds all activities that accomplish transition program and deactivation project planning. This category focuses on the planning, development, and generation of transition programs and deactivation project documentation and plans.

2. Surveillance and Maintenance:

   Funds all activities that maintain surplus and transferred buildings with required functions (i.e., surveillance and maintenance of fire, safety and life support systems, building support, and essential services as specified by Operational Safety Requirements). This category includes system/facility monitoring, corrective and preventive maintenance.

3. Stabilization/Deactivation Actions:

   Funds all activities that stabilize nuclear materials or that remove surplus materials, chemicals, and supplies including removal of hazardous, mixed, and radioactive wastes. These actions are undertaken to reduce the cost of surveillance and maintenance. Examples of deactivation work include de-energizing utilities, draining plumbing lines, removing fuel rods from nuclear reactors, and dismantling unsafe portions of equipment and buildings.

4. Spent Nuclear Fuel:

   Funds all activities associated with the management of DOE Spent Nuclear Fuel (SNF). These actions would include all activities that will stabilize vulnerable SNF, and store the SNF in a safe condition which is compatible with the permanent repository for an interim period of time (assumed to be 40 years). Eventually, all DOE SNF will be transferred to the permanent repository.

The FY 1997 Nuclear Material and Facility Stabilization budget reflects a scope of work utilizing prior year uncosted balances.

NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE
(Dollars in Thousands)

IDAHO

I. Mission Supporting Goals and Objectives

The Idaho National Engineering Laboratory (INEL), established in 1949 as the National Reactor Testing Station, is situated on more than 890 square miles of the Snake River Plain in southeastern Idaho. Over the years, 52 reactors have been constructed and operated at the INEL. There are nine primary facilities at the INEL, as well as administrative, engineering, and research laboratories in Idaho Falls, approximately 50 miles east of the site.

1. The Nuclear Material and Facility Stabilization program is responsible for surveillance and maintenance of facilities in the deactivation and Spent Nuclear Fuel management programs at the INEL.

2. The Idaho deactivation program creates and maintains an inventory of contaminated and uncontaminated surplus facilities. It also conducts deactivation projects in the surplus facilities to transition the facilities into a safe, stable, low surveillance and maintenance cost position.

3. The Spent Nuclear Fuel (SNF) program receives and stores Naval spent nuclear fuel and other DOE assigned spent nuclear fuel. Current focus of the program is on placing all spent fuel into interim dry storage and preparing the fuel for permanent disposition in a geologic repository.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Surveillance and Maintenance	$ 0	$ 4,492	$ 2,100	$ -2,392	-53
Stabilization/Deactivation Activities	0	2,806	2,912	+106	+4
Spent Nuclear Fuel	5,476	5,183	8,031	+2,848	+55
TOTAL, Idaho	$ 5,476	$ 12,481	$ 13,043	$ +562	+5

III. Performance Summary

FY 1995 Accomplishments
- o Continued ongoing project management and technical guidance for the Three Mile Island (TMI) Long-Term Storage Project.
- o Validated the canister dewatering design requirements.
- o Obtained DOE-HQ's approval on the Baseline Change Proposal to include scope to move TMI fuel to the Idaho Chemical Processing Plant.

III. Performance Summary - Idaho (Continued)

FY 1995 Accomplishments (Continued)
- o Revised the Project Management Plan.
- o Completed conceptual design for the canister dewatering system.
- o Prepared an Environmental Assessment (EA) and submitted it for public review.
- o Initiated title design for the canister dewatering system.
- o Prepared turnkey procurement package for the Interim Storage System (ISS).
- o Completed bid process and recommended award of the turnkey subcontract.
- o Completed design of the excavation and fencing package in support of the ISS subcontract (internal Lockheed Idaho Technologies Company design).

FY 1996 Accomplishments (To Date and Planned)
- o Complete formalized project baseline for the deactivation of the Advanced Reactivity Measurement Facility (ARMF)/Coupled Fast Reactivity Measurement Facility (CFRMF), and the Materials Test Reactor Canal.
- o Complete the movement of all (70) spent fuel elements, clean up and decontaminate the canal, and disposal of hazardous materials for the deactivation of the ARMF/CFRMF.
- o Continue to support project management activities including: management/technical guidance; Canister Characterization Plan development; audits; procedure development; and operations support.
- o Award the ISS facility design and construction contract to New Port News.
- o Prepare and submit a license application to the Nuclear Regulatory Commission (NRC).
- o Complete title design and begin fabrication of the canister dewatering (mechanical and electrical) system.
- o Begin fabrication of the canister dewatering system.
- o Revise the Project Management Plan and issue Baseline Change proposals to reflect the commercial approach procurement strategy for the ISS.
- o Obtain commitment from the Office of Civilian Radioactive Waste Management (OCRWM) to use their MP-187 transport cask for the movement of the TMI-2 fuel from Test Area North (TAN) to the Idaho Chemical Processing Plant (ICPP).
- o Complete design of the 1/12 scale demonstration test.
- o Complete the EA and issue the Finding of No Significant Impact (FONSI) for the ISS.
- o Determine the storage method for the Loss Of Fluid Test (LOFT) fuel and commercial fuel currently located in the TAN pool.

FY 1997 Planned Accomplishments
- o Provide required ongoing surveillance and maintenance for spent fuel at the Power Burst Facility (PBF) and Material Test Reactor Canal, and reduce the surveillance and maintenance on the Advanced Reactivity Measurement Facility/Coupled Fast Reactivity Measurement Facility $2,100
- o Complete the deactivation of the ARMF/CFRMF project and prepare documentation to transfer the facility to the Environmental Restoration program for decontamination and decommissioning. Complete the transfer of 222 (50 percent) special nuclear material items (i.e. fuel elements, scrap, etc.) from the Material Test Reactor Canal to storage at the ICPP 2,912

2018

NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE (Continued)

III. Performance Summary - Idaho (Continued)

FY 1997 Planned Accomplishments (Continued)

o Continue support for the Long-Term Storage of TMI-2 Fuel project including: project management activities, canister dewatering system testing, 1/12 size vault demonstration testing, NRC licensing support, and Interim Storage System pad construction	$ 8,031
Total FY 1997, Idaho	$ 13,043

Explanation of Funding Changes FY 1996 to FY 1997:

- o A decrease of $2,392,000 in the surveillance and maintenance (S&M) category reflects deferral of the Power Burst Facility deactivation project. In FY 1996 the deactivation funding was used for a one time S&M activity.
- o The increase of $2,848,000 in the Spent Nuclear Fuel program is attributable to changed requirements for the Long-Term Storage of TMI-2 Fuel project including acquisition of an NRC license and completing construction of the project in order to meet the Governor Batt Agreement milestone.

Major Issues:

- o None

2019

OAKLAND

I. Mission Supporting Goals and Objectives

The Oakland Operations Office manages operations at the Lawrence Berkeley National Laboratory (LBNL), the Lawrence Livermore National Laboratory (LLNL), and the Energy Technology Engineering Center (ETEC).

The Department of Energy (DOE) operations are conducted in Rockwell International-owned and DOE-owned facilities on a 290-acre site. The ETEC portion of the Santa Susana Field Laboratory consists of government-owned buildings that occupy 90 acres of the 290-acre site. The Rockwell facilities include former fabrication facilities, a hot cell, a reactor test building, a storage vault, an onsite transport cask, and other radiologically contaminated support laboratories and areas. The ETEC facilities are used to test nonnuclear systems and components for use in energy, power conversion, and liquid metal development programs.

The Lawrence Livermore National Laboratory main site is approximately one-square-mile facility located on flat land in the Livermore-Amador Valley, approximately 40 miles east of San Francisco, on the eastern border of the city of Livermore. This site has an interim status Resource Conservation and Recovery Act (RCRA) Part B Permit for a treatment, storage, and disposal facility for hazardous, mixed, and low-level waste. Past operations involving the handling of storage of hazardous materials at the main site have resulted in the release and subsequent migration of contaminates into soil and groundwater. The Nuclear Material and Facility Stabilization program monitors surveillance and maintenance (S&M) activities for six sodium facilities at ETEC and initiates efforts to lower that cost.

These facilities perform a number of diverse research and development activities.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	%Change
Program Integration	$ 0	$ 1,216	$ 0	$ -1,216	-100

Stabilization/Deactivation Actions	0	0	7,000	+7,000	N/A
TOTAL, Oakland	$ 0	$ 2,888	$ 16,146	$+13,258	+459

2020

NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE (Continued)

III. Performance Summary - Oakland (Continued)

FY 1995 Accomplishments
- o No activity.

FY 1996 Accomplishments (To Date and Planned)
- o Provide S&M activities for the six Surplus Facility Inventory Assessment (SFIA) high ranking assets at ETEC, and plan for the removal of non-radioactive contaminated sodium.
- o Ship the shielding block from Bevalac (Oakland) to the Brookhaven National Laboratory (BNL) in joint effort with Energy Research.
- o Provide surveillance and maintenance for the ETEC inactive/standby buildings.

FY 1997 Planned Accomplishments

o Conduct planned/unplanned maintenance checks for six SFIA high ranking assets and initiate bulk sodium transfer to an offsite user, and implement an S&M cost reduction plan	$ 672
o Continue to provide S&M for inactive/standby facilities, buildings, and associated units; disposition of the equipment with commercial value as well as hazardous materials to reduce S&M requirements; continue the contract termination closeout process	8,474
o Initiate removal of bulk sodium from the six high ranking facilities at ETEC; initiate removal of residue sodium in the piping and facility components from the six high ranking facilities at ETEC; initiate non-sodium hazardous waste removal activities for ETEC facilities/buildings; prepare a National Environmental Policy Act (NEPA) Environmental Assessment (EA) for activities associated with ETEC	7,000
Total FY 1997, Oakland	$ 16,146

Explanation of Funding Changes FY 1996 to FY 1997:
- o A decrease of $1,216,000 in Program Integration category reflects the completion of shipping the shielding block from Bevalac to the BNL.
- o An increase of $7,474,000 in the surveillance and maintenance category reflects the commencement of efforts to transfer bulk sodium to an offsite user.
- o An increase of $7,000,000 in stabilization/deactivation actions reflects the transfer of activities at the ETEC from the Office of Nuclear Energy.

Major Issues:
- o None

1202

OAK RIDGE

I. Mission Supporting Goals and Objectives

The Oak Ridge Operations Office manages the Oak Ridge National Laboratory (ORNL), the surplus enrichment plants at Oak Ridge, Tennessee, and the surplus high assay enrichment plant at Portsmouth, Ohio. The Oak Ridge Reservation is located 20 miles west of Knoxville, in eastern Tennessee.

The ORNL occupies several sites and covers approximately 2,900 acres in Melton and Bethel Valleys, 10 miles southwest of the city of Oak Ridge, Tennessee. The ORNL's mission is to conduct applied research and development (R&D) in support of DOE programs in fusion, fission, conservation, fossil, and other energy technologies and to perform basic research in selected areas of the physical and life sciences.

The Nuclear Material and Facility Stabilization program is responsible for placing and maintaining the isotope facilities in a safe, environmentally and economically sound condition until they are ready for decontamination and decommissioning. Many of the facilities are contaminated and require continuous monitoring to assure public protection from unplanned releases.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 400	$ 1,025	$ 1,035	$ +10	+1
Surveillance and Maintenance	5,870	8,551	6,030	-2,521	-29
Stabilization/Deactivation Actions	3,398	4,337	7,573	+3,236	+75
TOTAL, Oak Ridge	$ 9,668	$ 13,913	$ 14,638	$ +725	+5

2022

III. Performance Summary - Oak Ridge (Continued)

FY 1995 Accomplishments

- o Completed decontamination and fixation of contamination in the Storage and Service Facility (Building 3036).
- o Initiated deactivation of the Cobalt Storage Facility (Building 3029).
- o Removed tritium lights from the Krypton Enrichment Facility (Building 3026-C).
- o Deactivated six hot cells in Building 3028.

FY 1996 Accomplishments (To Date and Planned)

- o Conduct surveillance and maintenance actions in the 19 isotope facilities (contain 1,260,000 curies of radioactive materials) and 10 additional facilities which contain reactor fuel.
- o Provide water, steam, electricity and compressed air to 25 isotope facilities and high ranking facilities.
- o Continue deactivation of Buildings 3038, 3029 and 3026-C; dispose of eleven gloveboxes and deactivate one hot cell in Building 3038-E; remove two radioactive processing systems for handling tritium and krypton in Building 3033.

FY 1997 Planned Accomplishments

o Provide guidance and coordination for 19 isotope facilities currently in the Nuclear Material and Facility Stabilization program and 31 facilities transferring into the Office of Environmental Management from the Office of Nuclear Energy (NE), which include: develop planning and budget documentation and verify facility conditions for 19 former production isotope facilities; and develop post deactivation surveillance and maintenance plans for Buildings 3028, 3029, 3033, 3026-C, and 7025 ...	$1,035
o Conduct routine and unplanned maintenance checks and calibrations on approximately 2,900 pieces of mechanical equipment and instrumentation in 30 facilities including: perform weekly radiological protection surveys for 10 of the 31 facilities which contain reactor fuel, radioactive sources, and contaminated control areas; provide water, steam, electricity, and compressed air to 10 high ranking facilities and 15 isotope facilities; conduct routine and unplanned maintenance checks and calibrations on approximately 1,000 pieces of mechanical equipment and instrumentation in 17 isotope facilities; and perform weekly radiological protection surveys for 19 isotope facilities containing approximately 1,260,000 curies of radioactive materials	6,030
o Stabilization/Deactivation activities include: initiate actions to dispose of surplus contaminated equipment in Buildings 3010, 3019B, 7700, 7602; initiate plans for removal of fuel from the Tower Shielding Reactor (TSR) Facility including disposition of 55 tons of sodium and 6 tons of lithium hydride; initiate activities to package and ship 21 fuel elements in the TSR and 73 spent fuel elements in the Bulk Shielding Reactor (BSR) Facility to Savannah River Site; complete deactivation of Building 3038 gloveboxes and hoods at Building 3047 and upgrades at Building 3517; remove all waste from Building 3026-D and 3038-AHF hot cells and 3038 barricade; ship surplus material containing 108,949 curies of cesium and 1,259,583 curies of strontium to the Waste Encapsulation Storage Facility at Hanford; and complete deactivation of three isotope facilities	7,573
Total FY 1997, Oak Ridge	$ 14,638

2023

NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE (Continued)

Explanation of Funding Changes FY 1996 to FY 1997 - Oak Ridge:

- The decrease in surveillance and maintenance of $2,521,000 is due to complete deactivation of three isotope facilities and further stabilization of materials associated with two reactor facilities and their ancillary structures.
- The increase in Stabilization/Deactivation Actions of $3,236,000 reflects the initiation of activities to disposition 22 tons of sodium and other hazardous materials currently located at the Tower Shielding Reactor site.

Major Issues:

- None

2024

NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE
(Dollars in Thousands)

RICHLAND

I. Mission Supporting Goals and Objectives

The Richland Operations Office (RL) manages the Hanford Site, which is located on approximately 560 square miles (1,450 square kilometers) in southeastern Washington. Facilities at the Hanford site were among the first facilities constructed by the Manhattan Project.

The majority of the Richland Advanced Reactors Transition Program is comprised primarily of the Fast Flux Test Facility (FFTF) shutdown project. Additional Advanced Reactors Transition program elements include: Nuclear Energy (NE) legacy facilities; which include several non-reactor liquid metal treatment/storage facilities and a Sodium Test Facility; Building 308 deactivation, the test reactor and Isotope Production, General Atomics (TRIGA Fuel), and Building 309 transition. The primary mission of the Advanced Reactors Transition Program is to achieve a safe, environmentally compliant and cost-effective transition of the program facilities to a final shutdown configuration.

The FFTF is a 400-megawatt, sodium-cooled, fast flux test reactor that became fully operational in 1982. Due to the lack of a long-term mission, the Secretary of Energy ordered the shutdown of the facility on December 15, 1993. The FFTF transition mission is to accomplish a radiologically and industrially safe shutdown by FY 2002. Major FFTF deactivation activities include: reactor defueling (completed in FY 1995); fuel offload, washing and storage; sodium systems drain to a sodium storage facility; and support systems shutdown.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 800	$ 605	$ 1,072	$ +467	+77
Surveillance and Maintenance	56,036	28,429	25,397	-3,032	-11
Stabilization/Deactivation Actions	7,280	20,255	21,057	+802	+4
Change in Inventories	-680	0	0	0	0
TOTAL, Richland	$ 63,436	$ 49,289	$ 47,526	$ -1,763	-4

2025

III. Performance Summary - Richland (Continued)

FY 1995 Accomplishments

- o Provided required financial and program planning documents, such as Activity Data Sheets and Site Integration Planning.
- o Provided maintenance for 260,000 gallons of hazardous liquid sodium, 600 gallons of sodium potassium alloy, and 12 metric tons of spent nuclear fuel at the Fast Flux Test Facility (FFTF).
- o Completed FFTF reactor defueling.
- o Completed deactivation of 21 (of a total 100) active auxiliary support systems at FFTF.
- o Received and tested the first interim storage cask for storage of FFTF reactor fuel.
- o Commenced operational testing of FFTF fuel offload equipment.
- o Completed design of the FFTF Sodium Storage Facility.
- o Received the first TRIGA reactor fuel cask for use in shipping and storing spent fuel for Building 308.
- o Completed pumping 15,000 gallons of contaminated water from Building 309 Plutonium Recycle Test Reactor ion exchanger vault. Completed cleanout and stabilization of the ion exchanger vault including removal of 12 ion exchange columns.
- o Removed small heat transient Sodium Test Loop and shipped to LM Manufacturing per a Cooperative Research and Development Agreement.

FY 1996 Accomplishments (To Date and Planned)

- o Provide required financial and program planning documents, such as Activity Data Sheets and Site Integration Planning.
- o Continue to provide maintenance for 194,000 gallons of hazardous liquid sodium, 600 gallons of sodium potassium alloy, and 12 metric tons of spent fuel at the FFTF.
- o Complete operational testing of FFTF fuel offload equipment and begin fuel washing. Complete washing and storing the first 63 (of a total 371) FFTF fuel assemblies.
- o Transfer 66,000 gallons of sodium from the FFTF secondary cooling system to storage tanks.
- o Complete shutdown of Group 2 and 3 support systems at FFTF (completes shutdown of 35 of a total 100 support systems).
- o Complete removal of TRIGA reactor fuel to storage and shut down Building 308.
- o Cleanout and stabilize the fuel element rupture loop ion exchanger and process system in Building 309.
- o Remove prototype applications Sodium Test Loop and initiate removal of Thermal Transmit Loop.
- o Complete dismantlement of approximately 600 feet of thermal loop piping in Building 335A and initiate removal of approximately 200 feet of High-Temperature Sodium Facility test loop piping in Building 337 at the Advanced Reactors Nuclear Energy (NE) Legacy Facilities; ship sodium wetted components for reuse; and cleanup three Resource Conservation and Recovery Act (RCRA) sodium waste storage areas (Buildings 4843, 3718-M, and 105-DR)

2026

NUCLEAR MATERIAL AND FACILITY STABILIZATION - NON-DEFENSE (Continued)

III. Performance Summary - Richland (Continued)

FY 1997 Planned Accomplishments (Continued)	
o Provide required financial and program planning documents, such as Activity Data Sheets, Site Integration Planning, Progress Tracking Systems/Site Management System input and Multi-Year Program Plan, and submit sitewide system input	$ 1,072
o Provide surveillance and maintenance to ensures that surplus facilities at FFTF, Nuclear Energy Legacies and Building 309, which contains nuclear materials and chemical inventories such as 194,000 gallons of hazardous liquid sodium, 600 gallons of sodium potassium alloy, and 12 metric tons of spent fuel at FFTF, are maintained in a safe condition. Activities include the surveillance of safety controls; maintenance of fire, safety, and life support systems; and building support and essential services to be performed as specified by Operational Safety Requirements (OSR). This also includes system/facility monitoring, corrective and preventive maintenance, and safeguards and security.	25,180
o Procure vital equipment necessary to maintain safety and operational compliance i.e. replacing failed parts of vital offload equipment	217
o Complete the following deactivation work at Building 309: remove 24 lead bricks and coat internal surfaces in the Plutonium Recycle Test Reactor (PRTR) Fuel Element Rupture Test Facility Annex; stabilize\characterize exhaust stack, filter pit; and plan for removal of waste tanks	1,894
o Complete the following deactivation activities at FFTF: complete construction and startup of FFTF Sodium Storage Facility; initiate primary sodium drain to the FFTF Sodium Storage Facility; drain over 200,000 gallons of hazardous liquid sodium to the sodium storage facility; wash/process and transfer approximately 185 fuel assemblies to dry storage; continue auxiliary system shutdown; process two unique fuel assemblies and repackage for shipping	19,163
Total FY 1997, Richland	$ 47,526

Explanation of Funding Changes FY 1996 to FY 1997:

o The decrease in surveillance and maintenance (S&M) of $3,032,000 in FY 1997 is due to the completion of a Sodium Storage Facility construction project for the offload of liquid sodium, which enables the shutdown of related plant systems that would otherwise require S&M.

Major Issues:

o None

SIGNIFICANT CHANGES

- As a result of the October 17, 1995, DOE/NAVY/State of Idaho consent order/settlement agreement on Spent Fuel and Nuclear Waste, and a decision to seek licensing of this facility through the Nuclear Regulatory Commission (NRC), the cost spending profile has been revised to reflect the beginning of construction as a result of obtaining the NRC License.

1. Title and Location of Project: Long-Term Storage of TMI-2 Fuel, Idaho National Engineering Laboratory, Idaho (Continued)	2a. Project No.: 93-E-900	ADS# ID-6353-SF
	2b. Construction Funded	

8. Project Description, Justification and Scope

This project provides dry storage for all reactor fuel bearing materials currently in the Test Area North (TAN) Hot Shop Pool. This will include the Three Mile Island-2 (TMI-2) core debris (packaged in stainless steel canisters), Loss-of-Fluid (LOFT) fuel modules and a small amount of DOE-owned commercial fuel. The TMI-2 core debris canisters and the LOFT and commerical fuel will be moved to an interim storage system at ICPP provided by a vendor under a design/build/turnkey procurement contract. The Long Term Storage of TMI-2 Fuel Project includes construction of a canister dewatering system and an Interim Storage System (ISS) and procurement of transport equipment.

The purpose of this project is to provide dry fuel storage capabilities for all the fuel bearing material currently stored in the TAN-607 Pool and thus reduce the current risk of submerged fuel storage. The TAN-607 Pool does not meet current DOE Orders. This project will allow the pool to be taken out of service. A commercially available and licensable dry storage system will be constructed at ICPP. A dewatering system will be installed at TAN to remove the water from the canisters prior to transport and dry storage. Transport equipment will also be provided.

Justification of need for the Long-Term Storage of TMI-2 Fuel Project is five fold. In prioritized order, this project will: (1) meet the October 17, 1995, DOE/NAVY/State of Idaho consent order/settlement agreement on spent fuel and nuclear waste; (2) significantly reduce annual storage costs, saving at least $2,000,000 per year for 30 years, for storage surveillance activities; (3) avoid potential long-term problems associated with storage in an unlined, obsolete (circa 1950) pool - no installed monitoring apparatus exists; (4) prolong canister life thus eliminating subsequent repackaging costs by removing the canisters from the lifetime-limiting water environment; and (5) allow removal of fuel materials from the pool, allowing the facility to be made available for shutdown, decontamination, and decommissioning.

2032

1. Title and Location of Project: Long-Term-Storage of TMI-2 Fuel, Idaho National Engineering Laboratory, Idaho (Continued)	2a. Project No.: 93-E-900 2b. Construction Funded	ADS# ID-6353-SF

9. Details of Cost Estimate a/

	Item Cost	Total Cost
a. Design and Management costs		$ 5,300
1. Engineering design and inspection at approximately 9 percent of construction costs, Item c	$1,500	
2. Construction Management Costs	200	
3. Project management at 22 percent of construction costs (Item c)	3,600	
b. Land and land rights		0
c. Construction costs		16,437
1. Improvements to land	275	
2. Buildings	0	
3. Other structures	15,132	
4. Utilities	330	
5. Special facilities	700	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a through g)		$ 21,737
i. Contingencies at approximately 17 percent of above costs		3,763
j. Total line item cost (Section 11.a.1.[a])		$ 25,500
k. Less: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 25,500

a/ These estimates are based on an awarded contract for the Interim Storage System and conceptual design for the dewatering system.

10. Method of Performance

The Interim Storage System will be procured via a turnkey contract. The vendor will perform design, construction, testing, and facility turnover. All other aspects of the project will be managed by the operating contractor through normal operating procedures and methods.

The dewatering system will be designed, procured, and assembled by the INEL operating contractor's personnel.

11. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1995	FY 1996	FY 1997	Outyears	TOTAL

(i) Net Federal total project cost (TPC)	$ 2,574	$ 838	$ 7,688	$ 8,333	$10,567	$ 30,000

2034

11. Schedule of Project Funding and Other Related Funding Requirements (continued)

b. Related annual costs

(1) Facility operating costs	$ 950
(2) Facility maintenance and repair costs	0
(3) Programmatic operating expenses directly related to the facility	0
(4) Capital equipment not related to construction but related to the programmatic effort in the facility	0
(5) GPP or other construction related to the programmatic effort in the facility	0
(6) Utility costs	0
(7) Other costs	0
Total related annual costs	$ 950

NOTE: Annual operating costs will depend on the type of storage system (which will be determined by the successful bidder) and the passive nature of operation. This estimate assumes some form of HVAC system.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

(1) Total facility costs

(a) Line item--The TEC is based on a detailed conceptual design cost estimate validated by a team of INEL cost estimators.
(b) PE&D--None.
(c) Expense-funded equipment--None.
(d) Inventories--None.

(2) Other project costs

(a) R&D necessary to complete construction--None.
(b) Conceptual design--None.
(c) Decontamination & decommissioning (D&D)--None.
(d) NEPA documentation costs--$130,000 for the preparation and approval of the Environmental Assessment document.
(e) Other project related costs--Funds are required to support the following activities: (1) project planning, (2) construction management planning, 3) Quality Assurance/inspection planning, (4) project management for design support, construction support, testing, and startup, (5) safety analyses and reports, (6) readiness reviews for startup and operation, (7) operating tests, (8) training of operating and maintenance personnel, and (9) general technical support ($4,370,000).

2035

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

b. Related annual costs
(1) Facility operating costs--Includes operating labor costs and maintenance to transfer fuel to ICPP.
(2) Facility maintenance and repair costs--Includes spare parts and maintenance costs.
(3) Programmatic operating expenses related directly to the facility--None.
(4) Capital equipment not related to construction but related to the programmatic efforts in the facility--None.
(5) GPP or other construction related to the programmatic effort in the facility--None.
(6) Utility costs--None.
(7) Other costs--None.

SITE OPERATIONS - NON-DEFENSE

PROGRAM MISSION

The Office of Site Operations' mission is to serve as a focal point and champion in the Office of Environmental Management (EM) for the Operations Offices and field sites by providing leadership for crosscutting issues and topics raised by the field and/or EM Headquarters by serving as facilitator, ombudsman, and/or coordinator. The mission includes being knowledgeable about the state of EM business, to identify and resolve common problems, and to enhance EM operations by providing independent programmatic guidance, policy, and technical assistance. As the focal EM office for crosscutting issues, the Office develops Department-wide and site-specific policy and guidance necessary to implement pollution prevention activities. The Office also employs sound environmental, safety, and health measures in the cleanup, transition to safe shutdown, and disposition of the Mound site.

The GOALS of the Site Operations Program are to:

- o Implement policies and practices that will encourage all operations to reduce the generation and releases of wastes and pollutants.
- o Implement waste minimization/pollution prevention (WMin/PP) projects that will pay for themselves in three years or less.
- o Develop a model for integrating all Environmental Management Program activities at smaller DOE sites in order to manage and expedite the closeout and disposition of activities and facilities.

The OBJECTIVES related to these goals are to:

- o Establish for Mound an approved, integrated closeout plan for its cleanup and disposition activities so that an exit date and associated costs can be determined and continue accelerated cleanup and shutdown of the plant site.
- o Establish and maintain an incentive program that makes the waste generators accountable financially and managerially for their waste.
- o Implement projects to meet the Department's pollution prevention reduction goals.

PERFORMANCE MEASURES:

- o Number of pollution prevention projects implemented and costs saved or avoided by these projects.
- o Achieve the Department's seven pollution prevention goals.

MOUND AND PINELLAS PROJECT OFFICE

I. Mission Supporting Goals and Objectives

The Mound Plant site is located in Miamisburg, Ohio and was built in the late 1940's to support research and development and production activities for the Department's weapons and energy programs. It occupies 306 acres of land in southwestern Ohio. Weapons production support ended in 1994, when activities across the country were consolidated at the Kansas City Plant (KCP) in Missouri, Los Alamos, and Savannah River. Mound is currently processing tritium units for Defense Programs (DP) through CY 1997. There are potentially 406 sites where radioactive and/or hazardous chemicals may have been released. During the plant lifetime, Mound manufactured items containing plutonium-238, polonium-210, and tritium and processed large quantities of various types of explosives. Contamination of soils and ground water with radioactive and hazardous chemicals has occurred as a result of these manufacturing and processing operations. Mound has been placed on the National Priority List (NPL), and the Federal Facility Agreement (FFA) for accomplishing the remediation of Mound has been negotiated with the EPA and the State of Ohio. Activities at the Mound Plant are managed by the Miamisburg Area Office. The mission of the Mound Plant involves the transition from an active production plant to a total safe shutdown and cleanup of the facilities and soil, and sale of the property.

The Nuclear Material and Facility Stabilization program assumed management of Mound on August 1, 1995, and assigned overall programmatic responsibilities to the Mound and Pinellas Project Office, which was realigned under the Office of Site Operations in December 1995. The Mound and Pinellas Project Office assumes a leadership role to ensure that the Department of Energy (DOE) exits these sites in a safe, rapid, cost effective, and public sensitive manner. The only non-defense environmental remediation currently being conducted at Mound is the decontamination of areas within the Semi-Works Cave caused by a non-defense project relating to the recovery of various radionuclides from Cotter concentrates.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Mound/Pinellas Project Office	$ 974	$ 1,061	$ 1,223	+162	+15%

III. Performance Summary

FY 1995 Accomplishments:

o Initiated Semi-Works Cave areas decommissioning at Mound.

FY 1996 Accomplishments (To Date and Planned):

o Continue Semi-Works Cave areas decommissioning at Mound.

FY 1997 Planned Accomplishments:

o Continue Semi-Works Cave Areas decommissioning at Mound $1,223

Explanation of Funding Changes FY 1996 to FY 1997:

o None

Major Issues:

o None

20042

POLLUTION PREVENTION

I. Mission Supporting Goals and Objectives

The DOE Pollution Prevention Program mission is to reduce generation and releases of DOE multi-media wastes and pollutants by implementing cost-effective waste minimization and pollution prevention technologies, practices, and policies while conducting the Department's operations in compliance with applicable environmental requirements. The Office of Pollution Prevention is responsible for implementing the Department's Pollution Prevention mission.

The primary objective of the Department's pollution prevention program is to reduce the generation of all waste streams in order to minimize the impact of the Department's operations on the environment, reduce operational cost, and improve the energy efficiency and health and safety of its operations. Pollution Prevention is also required by various Federal laws and Executive Orders including but not limited to: Pollution Prevention Act of 1990; Resource Conservation and Recovery Act (RCRA); Emergency Planning and Community Right-to-Know Act (EPCRA); and Executive Order 12856.

The Department's Pollution Prevention program will affect all its operations including EM, DP, and Energy Research. Ten Operations Offices with 30 major sites have site-wide pollution prevention programs including Albuquerque, Oak Ridge, Savannah River, Idaho, Rocky Flats, Chicago, Oakland, Nevada, and Ohio.

In FY 1996, EM is seeking to establish aggressive DOE-wide Secretarial goals to be achieved by December 31, 1999, as follows:

- Reduce total releases and offsite transfers for treatment and disposal of Emergency Planning and Community Right-to-Know Act (EPCRA) toxic chemicals from routine operations 50 percent.
- Reduce the generation of radioactive waste from routine operations 50 percent.
- Reduce the generation of low-level mixed waste from routine operations 50 percent.
- Reduce the generation of hazardous waste from routine operations 50 percent.
- Reduce the generation of sanitary waste from routine operations 33 percent.
- Divert from recycling 33 percent of sanitary waste from all operations.
- Increase the affirmative procurement of Environmental Protection Agency (EPA) designated recycled products to 100 percent except where they are not available competitively at a reasonable price or do not meet performance standards.

Progress toward achieving the goals will be determined by using 1993 as the baseline year.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Pollution Prevention	$ 1,155	$ 2,567	$ 1,576	-991	-39%
TOTAL, Pollution Prevention	$ 1,155	$ 2,567	$ 1,576	-991	-39%

III. Performance Summary

FY 1995 Accomplishments:

- o Developed and operated site-wide pollution prevention programs for non-defense related activities at Chicago, Oakland (San Francisco), and Albuquerque.
- o Implemented pollution prevention activities that are necessary to comply with regulations, Executive Orders, and DOE requirements as outlined in the 1994 Waste Minimization/Pollution Prevention Crosscut Plan. Examples of activities include conducting assessments to identify pollution prevention opportunities, tracking and reporting pollution prevention progress, modifying procedures to ensure pollution prevention become operating practices, and conduct training.

FY 1996 Accomplishments (To Date and Planned):

- o Continue the development, refinement, and operation of the site-wide pollution prevention programs.
- o Implement high Return-on-Investment (ROI) projects that pay for themselves.
- o Reduce the generation of hazardous, low-level radioactive, and mixed waste by 10 percent from the 1993 baseline.

Performance Summary: (con't)

FY 1997 Planned Accomplishments:

- Review/refine/operate the site-wide pollution prevention programs to be consistent with the Secretarial reduction goals as stated in the DOE 1996 Pollution Prevention Program Plan. Shift emphasis to achieve the overall Departmental pollution prevention objectives of:
  - Establish Operations Office ROI program;
  - Implement incentive programs;
  - Achieve the Secretarial reduction, recycling, and procurement goals; and
  - Implement pollution prevention programs that are in compliance with requirements of regulations and Executive Orders.
  - Reduce waste by 15 percent from the 1993 baseline.

Total, FY 1997 Pollution Prevention	$1,576,000

Explanation of Funding Changes FY 1996 to FY 1997:

- Decrease of $ 991,000 is due to Chicago's effort to identify pollution prevention opportunities and will not fund new cost saving ROI projects.

Major Issues:

- None

PROPOSED APPROPRIATION LANGUAGE

For Department of Energy expenses, including the purchase, construction and acquisition of plant and capital equipment and other incidental expenses necessary for atomic energy defense environmental restoration and waste management activities in carrying out the purposes of the Department of Energy Organization Act (42 U.S.C. 7101, et seq.), including the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction or expansion; and the purchase of passenger motor vehicles (not to exceed [7] 20, *of which 19* are for replacement only), [$5,557,532,000] $5,409,310,000, to remain available until expended.(*Energy and Water Development Appropriations Act, 1996.*)

EXPLANATION OF CHANGE

There are no significant changes is this language. The primary change is that of the number of vehicles from seven to twenty.

2051

ENVIRONMENTAL MANAGEMENT

PROGRAM MISSION

The Environmental Management (EM) program is responsible for identifying and reducing risks and managing waste at sites where the Department carried out nuclear energy or weapons research and production activities. These past efforts resulted in radioactive, hazardous, and mixed waste contamination, which requires remediation, stabilization, or some other type of action. The EM program is budgeted under three appropriation accounts: Defense Environmental Restoration and Waste Management; Energy Supply, Research and Development; and the Uranium Enrichment Decontamination and Decommissioning Fund. Under the Defense account, the EM program includes waste management functions; privatization efforts; environmental restoration activities; technology development efforts; science and risk activities; nuclear material and facility stabilization activities; site operations functions; and a variety of crosscutting initiatives, including policy and management and public participation.

The **GOALS** of the EM program are:

- Eliminate and manage the urgent risk in the system;
- Emphasize health and safety for our workers and the public;
- Establish a system that increases managerial and financial control;
- Demonstrate tangible results;
- Focus technology development efforts on identifying and overcoming obstacles to progress; and,
- Establish a stronger partnership between the Department of Energy and its stakeholders.

To help achieve these goals, the EM program has made a commitment to performance measurement and to meeting the requirements of the Government Performance and Results Act of 1993. In response to this Act and in keeping with efforts to improve management practices, the Secretary of Energy has directed the Department to expeditiously adopt performance-based budgeting. The intent of performance-based budgeting is to show a direct relationship between program resources expended and results achieved. The EM program will continue to build on these efforts and focus its resources on meeting its goals.

When the EM program was established in late 1989, it inherited a legacy with significant environmental and political challenges. The 137 Environmental Management sites in 34 States have different functions, geographies, and degrees and types of contamination. The number of sites and facilities in the EM program continues to grow as the Department shifts its focus from primarily production efforts to environmental management activities. These sites include contaminated surface water or groundwater, soil, and structures totaling over 3,300 square miles of contaminated area. No other nation, government, or private entity has attempted a cleanup program of this scope and magnitude before.

The EM program must comply with a significant number of legal requirements which result from 103 Departmental compliance agreements and a multitude of Federal, State, and local health and safety environmental statutes. Bridging the gap between requirements in existing agreements, risks associated with conditions at the various sites, and available resources will be a challenge requiring increased cost efficiency through better project

performance and cost containment. The EM program's main challenge is to develop a strategy, within existing and projected technical and financial constraints, that enables the Department to meet its commitments to the American people.

MAJOR ACTIVITIES:

- Environmental Restoration: The objectives of this program are to stabilize radioactive waste, carry out remediation activities, or perform decontamination and decommissioning at contaminated DOE and legislatively-authorized non-government facilities and sites; to conduct assessments/characterization of DOE sites to determine if there is the potential for radioactive and hazardous waste releases; and to reduce and remove the potential risks to the environment and to human health and safety resulting from past defense-related Departmental activities.

- Waste Management: These activities are focused on safely, effectively, and efficiently managing the minimization, characterization, transportation, treatment, storage, and disposal of radioactive, hazardous, mixed, and sanitary wastes generated by past and ongoing operations at DOE facilities. These fundamental functions are necessary to safely and effectively manage waste which has resulted from the Department's defense-related nuclear programs, and to prepare for new waste resulting from Environmental Restoration activities.

- Privatization: Provides funding to privatize a tank waste remediation system at the Hanford Site in Washington. The funds are budgeted to allow the Department to reimburse contractors in the event the Government incurs liabilities for termination of privatization contracts..

- Technology Development: This program is a comprehensive applied research, development, demonstration, testing, and evaluation initiative to support environmental management activities through application of new technologies that increase overall efficiency and effectiveness while significantly reducing future costs. The objective of the program is to develop high-payoff technologies that can be applied to manage DOE-generated waste and to clean up the inventory of DOE-contaminated sites faster, safer, and cheaper than current environmental cleanup technologies.

- Environmental Science Program: The need to build a stronger scientific basis for Environmental Management program efforts has been established in a number of recent studies and reports. The Galvin Commission cited the most important reason behind the slow pace of assessment and cleanup of DOE waste sites as being the low quality of science and technology that is being applied in the field. Further, the Galvin Commission cited the need for long-term, basic research in disciplines related to environmental cleanup and adopting a science-based approach that includes supporting development of technologies and expertise. In response to the Galvin Commission Report, as well as other recent recommendations, the Office of Environmental Management (EM) has established an Environmental Science Program.

- Nuclear Material and Facility Stabilization: Coordinates and oversees the orderly transfer of surplus contaminated installations, facilities, and materials to EM, and plays a significant role in developing and implementing the policy and procedures for acceptance and disposition of these facilities. This program focuses on deactivation activities in a cost-effective and environmentally-sound manner to substantially decrease outyear surveillance and maintenance mortgages associated with currently contaminated facilities.

2053

PROGRAM MISSION, ENVIRONMENTAL MANAGEMENT - DEFENSE (continued)

MAJOR ACTIVITIES: (continued)

- Site Operations: Serves as the focal point and champion for crosscutting activities and responsibilities within the EM program, including serving as the advocate for the field at Headquarters. Provides policy direction for landlord planning and budgeting including reducing site infrastructure costs and managing workforce restructuring. This activity also includes Transportation and Pollution Prevention programs that provide for responsible DOE-wide transportation, packaging, and transportation emergency management and planning, coordinating and implementing a DOE-wide Pollution Prevention program.

- Policy and Management: Provides for crosscutting activities, such as educational development (which support the overall EM mission) and public accountability and strategic planning efforts.

- Program Direction: Provides salaries, benefits, travel, and contractual support for the Federal workforce responsible for the overall direction and administrative support of the Environmental Management program

ENVIRONMENTAL RESTORATION

PROGRAM MISSION

The mission of the Environmental Restoration (ER) program is to protect human health and the environment from risks posed by inactive and surplus Department of Energy (DOE) facilities and contaminated areas, by remediating, decontaminating and dismantling (D&D) sites, facilities and contaminated areas in the most cost-efficient and responsible manner possible in order to provide for future beneficial use. Program responsibilities include interim/remedial actions, D&D, compliance oversight, surveillance and maintenance (S&M), landlord functions and a prudent amount of program management and technical support activities.

This budget request includes funds to carry out activities that must be undertaken immediately to minimize or prevent significant risk to workers, the public or the environment; activities required by current Federal, State, and local regulatory agreements (in place or in negotiation); and support of other legal requirements, and DOE Orders.

The ER program currently manages, in the EM Defense, EM Non-Defense, and Uranium Enrichment Decontamination and Decommissioning Fund appropriation accounts, over 600 Comprehensive Environmental Response, Compensation and Reliability Act (CERCLA) and Resource Conservation and Recovery Act (RCRA) projects, including 320 projects associated with sites on the Environmental Protection Agency's (EPA) National Priorities List (NPL), 46 Formerly Utilized Sites Remedial Actions Program (FUSRAP) sites and 24 Uranium Mill Tailing Remedial Action Project (UMTRAP) sites, and more than 50 other projects. In total, the ER program is responsible for the remediation and management of 130 sites in 33 states and territories. This budget area addresses defense related areas of the total program discussed above. This Program Mission statement applies to the entire ER program, while specific Defense efforts are addressed in the Program Performance Summary which leads off the individual descriptions of site activities being carried out across the country.

The ER program faces the following challenges:

- Addressing and minimizing urgent and near-term risk to workers, the public and the environment.
- Maintaining a safe, productive, results oriented program.
- Effectively prioritizing and sequencing work covered by Federal and State agreements to incorporate relative risk.
- Demonstrating substantial progress to stakeholders/taxpayers.
- Maintaining the momentum of the program given the constrained budgetary climate facing all Government programs.

PROGRAM MISSION - ENVIRONMENTAL RESTORATION - DEFENSE (Continued)

To meet these challenges and fulfill its mission, the ER program has established eight goals. They are listed as follows:

(1) Eliminate, reduce, or contain off-site contamination that may pose an adverse risk to the public and/or environment.
(2) Prevent migration of contaminants through timely identification, reporting, assessment, application of best technologies, and safe storage.
(3) Identify, decontaminate and/or control all sites and facilities formerly used by DOE and its contractors.
(4) Eliminate, reduce, or contain on-site contamination, that in future land use, may pose an adverse risk to the public and/or environment.
(5) Responsibly and cost effectively invest in activities, such as site safety, security, and utilities required to maintain the infrastructure to support the ER mission.
(6) Expeditiously cleanup and release facilities and land for public beneficial use.
(7) Make prudent business decisions, such as, funding activities that support and enhance the effective and efficient achievement of the ER mission.
(8) Increase efforts to identify sources, nature and extent of contamination to allow more accurate determination of relative risk, scope and cost of projects and establish data needs/objectives before characterization to increase the cost effectiveness and efficiency of characterization efforts.

The broad strategy of the ER program is to accelerate remediation completions at small sites, address the highest risks first at large sites, and complete decommissioning. Hence, the ER program has organized its sites and facilities into five categories, based upon site and facility similarities, to implement this strategy. These five categories are: UMTRAP and FUSRAP, Other Small Sites, Large Site Decommissioning, and Large Site Remedial Actions. The organization into these five categories allows for comparability of like sites and facilities, refinement of program focus and direction, and development of remediation strategies. Remediation efforts at ER sites and facilities, within each category are prioritized and sequenced based upon the eight goals discussed above. The definition and objectives of these categories, with the exception of UMTRAP and FUSRAP, which are funded and described under the Non-Defense appropriation account, are discussed below.

2058

Other Small Sites Category

The Other Small Sites category includes those sites not included in FUSRAP or UMTRAP and have an estimate to complete of $150,000,000 or less. Completion of these sites best demonstrates tangible progress in ER to stakeholders, and site completions reduces total program costs by eliminating fixed costs. These sites also have relatively short project durations, small lifecycle costs and are well defined.

The objectives of this category, which includes both defense and non-defense efforts, are to reduce relative risk and demonstrate progress by completion of 25 sites (about 21 percent of total sites) from FY 1995 to FY 2000.

Large Site Decommissioning Category

This category includes all activities in the D&D program which are not included in the Other small sites category. D&D activities are typically lower priority, but hold the largest potential for reducing fixed infrastructure costs and, therefore, long-term mortgage.

The objectives of this category are to reduce long-term mortgage, address high risks, and maintain cost-effective funding level.

Large Site Remedial Actions Category

This category includes all activities in the Remedial Action (RA) program that are not included in any of the above categories. It is the largest segment of environmental restoration responsibility and includes sites with widely varied risk potential and possible large volumes of waste. These activities typically involve large projects driven by legal statutes and agreements.

The objectives of this category are to sequence work based on relevant attributes and maintain or reduce the current risk state at each site.

In response to the Department's commitment to improve management practices and to adopt performance based budgeting, the ER program tracks performance measures in four areas: 1) completed characterization/assessments; 2) completed interim and removal actions and expedited response actions; 3) completed remedial actions; and 4) completed final D&D projects. Characterization/Assessments are denoted by a completed key assessment document such as a Record of Decision (ROD), Corrective Measure Study (CMS), Closure Plan, D&D Plan, Proposed Plan, National Environmental Policy Act (NEPA) document, or No Action Decision. Interim and removal actions are any actions resulting in physical cleanup progress, reduction of exposure or contaminants or containment of a source term or any action to restrict access to contaminants. Final remedial actions include RCRA closures, RCRA final corrective measures, CERCLA final remedial actions and completed underground tank programs. D&D final actions are completed when D&D objectives have been met and a report has been submitted for approval. In addition, the program tracks the status of on-going projects in the four performance areas.

The ER program has aggressively pursued productivity savings and cost efficiency initiatives, with the objective to administer a program which delivers the "most bang for the buck." In particular, major efforts have been underway to increase the cost effectiveness and efficiency of characterization/assessment activities. In addition, much focus has been placed on the effective management of ER uncosted carryover balances to both reduce and optimize these balances using sound management practices.

To provide maximum flexibility in addressing remediation efforts, all activities are budgeted under operating expenses and include capital equipment-type and construction-type activities. This is consistent with the manner in which ER activities were budgeted and approved by Congress in previous years. General crosscutting support efforts required for effective management and control of ER activities are also included in this budget.

Tables (OV-1 through OV-4) follow which provide specific information relating to program distribution by State, performance measures, assessment versus cleanup trend and uncosted carryover trends for the ER program. These tables are presented from a "National" Environmental Restoration perspective. That is, they combine and display data for all three appropriation accounts for the purpose of demonstrating how the entire ER program fits together. Defense-specific tables can be found following the Program Performance Summary introductory paragraph for this section of the budget request.

2059

Table OV-1
ENVIRONMENTAL RESTORATION - FY 1997 CONGRESSIONAL BUDGET REQUEST

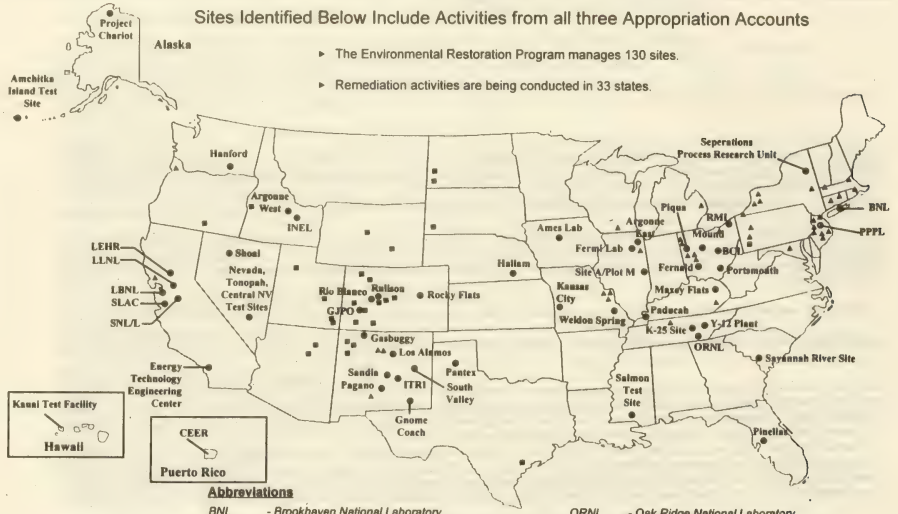

Table OV-2
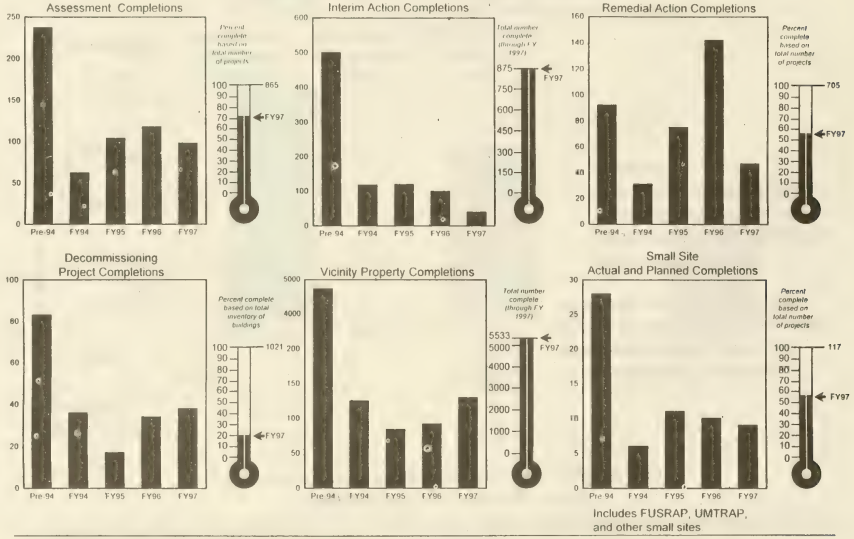
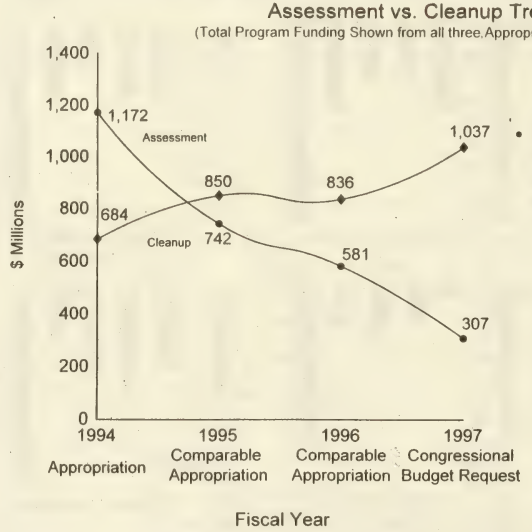
ENVIRONMENTAL RESTORATION - FY 1997 CONGRESSIONAL BUDGET REQUEST

(Includes Activities Supported from all three Appropriation Accounts)



Includes FUSRAP, UMTRAP, and other small sites

Table OV-3
ENVIRONMENTAL RESTORATION - FY 1997 CONGRESSIONAL BUDGET REQUEST



- Environmental Restoration is completing assessment and characterization activities more efficiently and cost-effectively
  - Efficiencies in the assessment phase expedite remediation activities and yield additional funds for cleanup.

2062

ENVIRONMENTAL RESTORATION

PROGRAM PERFORMANCE SUMMARY

The Environmental Restoration Defense Program Performance Summary includes remedial action (RA) activities, decontamination and dismantlement (D&D) efforts, surveillance and maintenance (S&M), landlord, compliance oversight activities, and a prudent amount of program management and technical support activities necessary to maintain the effective management of overall program efforts. All Operations/Field Office environmental restoration activities have been designated either a Major Systems Acquisition (MSA) or a Major Project (MP) by DOE and are administered in accordance with Departmental requirements for these major project designations. In addition, beginning with the FY 1997 Congressional Request, ER will be budgeting for the Rocky Flats Site, this will include Waste Management and Site Stabilization activities. For additional details on schedules and other site-specific information, please refer to the various Operating Expense Site Activity Description Sheets included with this submission.

Tables follow (D-1 through D-3) which provide specific information relating to overall fiscal year funding, distribution of funding by category of effort, and budget trends by category.

ENVIRONMENTAL RESTORATION
(Dollars in Thousands)

ALBUQUERQUE

I. Mission Supporting Goals and Objectives

The ER Program managed through the Albuquerque Operations Office supports activities at six sites in the States of Missouri (Kansas City Plant (KCP)), Texas (Pantex Plant), California (Sandia National Laboratories), and New Mexico (Los Alamos National Laboratory (LANL), Sandia National Laboratories (SNL), and the Albuquerque Operations Office.

The KCP is part of a 300-acre Federal complex located 12 miles south of downtown Kansas City, Missouri. In FY 1993, the Department shut down several facilities across the country and consolidated the production of non-nuclear components at the KCP site. Major environmental restoration efforts at the KCP include the restoration of 42 potentially contaminated release sites.

The Pantex Plant is located near Amarillo, Texas. The Pantex Plant has responsibility for ensuring the quality of the Nation's nuclear weapons stockpile, including dismantlement and maintenance. In FY 1994, the site was placed on the National Priorities List (NPL), thereby requiring remediation under CERCLA authority. Major environmental restoration activities at this site include the assessment of 144 solid waste management areas.

The SNL/CA facility is located adjacent to the Lawrence Livermore National Laboratory in California. The facility occupies an area of approximately 100 acres. Major environmental restoration activities include the cleanup of a 59,000 gallon diesel fuel oil spill from an underground transfer pipe.

The LANL encompasses over 43 square miles in northern New Mexico. LANL conducts major programs in multiple areas, including applied research in nuclear and conventional weapons development, nuclear fission and fusion, nuclear safeguards and security, and environmental and energy research. The environmental restoration LANL budget supports a variety of activities related to approximately 2,150 potential release sites which have been aggregated into 7 field units.

2073

I. Mission Supporting Goals and Objectives - Albuquerque (Continued)

The SNL/NM site, located in Albuquerque, New Mexico, is a research and development facility with a primary mission of developing, engineering, and testing non-nuclear components of nuclear weapons. Major environmental restoration efforts involve the remediation of inactive waste disposal and release sites at Albuquerque, Tonopah Test Range, Kauai Test Facility, Holloman Air Force Base, and a number of other remote locations. A total of 219 sites have been identified for further assessment and possible remediation. These sites have known or suspected releases of hazardous, radioactive, or mixed waste.

The Albuquerque Operations Office manages, coordinates, tracks, and assists in the implementation of the environmental restoration program among the Pantex, Kansas City, Sandia Laboratories, and LANL sites. Other environmental restoration activities managed by the Operations Office include cleanup efforts related to the South Valley Site located near Albuquerque, which was owned by the Atomic Energy Commission and operated by the American Car Foundry Company from 1951 to 1967. DOE is a potentially responsible party (PRP) under a tri-party agreement with the Air Force and General Electric for environmental restoration activities at the South Valley site. Agreements-in-Principle (AIPs) with the States of Texas and Missouri are also managed and implemented by the Albuquerque Operations Office. Legal drivers at Albuquerque include RCRA, CERCLA, NEPA, State laws and codes, and DOE Orders.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 131,089	$ 105,631	$ 75,532	$ -30,099	-28
Decontamination & Dismantlement	7,018	5,800	5,602	-198	-3
Compliance Oversight	1,348	653	1,729	1,076	+165
Total, Albuquerque	$ 139,455	$ 112,084	$ 82,863	$ -29,221	-26

III. Performance Summary

FY 1995 Accomplishments

- Completed closure plan for Navy Landfill at SNL/CA.
- Continued Fuel Oil Spill bioremediation and Navy Landfill ground water monitoring activities at SNL/CA.

2074

III. Performance Summary - Albuquerque (Continued)

FY 1995 Accomplishments (Continued)

- Provided PRP contribution for remediation of South Valley Superfund Site.
- Completed interim actions at Firing Training Area Burn Pits and the High Priority Release sites at the Pantex Plant.
- Continued the long-term ground water treatment and monitoring program at KCP.
- Accelerated interim measures removal and clean-up of waste, oil tank, and substation 18 as part of the Plating Building project at the KCP.
- Completed assessment phase for the High Priority Release Sites, Fire Training Area Burn Pits, Misc. Chemical Releases, H-E RAD Site and supplemental verification sites and Former Cooling Tower, except chromate characterization at Pantex.
- Completed assessment field work for Landfills and Fire Training Area Burn Pits at Pantex.
- Completed Phase II field work and installed operational treatability system for ground water at Pantex.
- Submitted NFA on Old Sewage Treatment Plant and Underground Storage Tanks (UST) at other locations and on leaking USTs at Pantex.
- Submitted Draft Final RFIR to the Texas Natural Resource Conservation Commission on ditches and playas at Pantex.
- IED/GIS became operational at Pantex.
- Completed field work for investigations at 4 additional sites at Pantex; completed 5 additional RFI reports.
- Completed 8 D&D activities for Technical Area 16 H-E contaminated buildings at Pantex.
- Completed 26 RFI Reports for approximately 50 Solid Waste Management Units (SWMUs) at LANL. (complete September 1995)
- Continued preparation of RFI Workplans for Mortandad, Pueblo, and Los Alamos Canyons at LANL. (complete FY 1996)
- Continued remedial activities at all field units including completion of 45 voluntary corrective actions and expedited cleanups at LANL. (completed September 1995)
- Completed D&D activities at Technical Area 21 Building 3 and 4 South at LANL. (completed May 1995)
- Initiated D&D planning activities for Technical Area 21, Buildings 3 and 4 North, Building 146, and Building 324 at LANL. (complete FY 1996)
- Initiated D&D planning activities for Technical Area 16 High Explosives Contaminated Buildings at LANL. (complete FY 1996)
- Continued S&M of the SNL Engineering Reactor.
- Continued site-wide hydrogeologic characterization at SNL/NM.
- Completed 34 interim actions at SNL/NM.
- Continued providing project oversight, technical review, and management assistance for the Salmon Sea Test Base, Kauai Test Facility, and Off-Site Area non-SNL/NM lead restoration projects.
- Continued technical support activities at SNL/CA and SNL/NM.
- Provided for AIP support to States for Albuquerque production sites (TX and MO).
- Performed non-site-specific activities including project management, project control, and facilities management.

2075

ENVIRONMENTAL RESTORATION - DEFENSE (Continued)

III. Performance Summary - Albuquerque (Continued)

FY 1996 Accomplishments (To Date and Planned)

- Complete the ICM/CMS phase and submit Draft Final RFIR at the Firing Sites at Pantex.
- Complete ICM on Ditches & Playas at Pantex.
- Complete CAP report and closure on leaking USTs at Pantex.
- Continue Program Management and technical support activities at Pantex.
- Complete Final RFI Report and NFA Request on Misc. Chemical Spills and Supplemental Verification Sites at Pantex.
- Complete Final RFIR and NFA Request on HE Rad Sites at Pantex.
- Complete ICM, submit Group II Draft Final RFIR, and finalize Group I RFIR on Landfills at Pantex.
- Complete Fate and Transport Model on Landfills t Pantex.
- Complete Groundwater Protection Project at Pantex.
- Finalize Federal Facility Agreement as required by CERCLA at Pantex.
- Complete Final RFI Report, NFA Request, and closure on High Priority Release Sites at Pantex.
- Complete Phase II characterization, Final RFI Report and NFA Request on Burning Grounds at Pantex.
- Complete Phase II of treatability system and Draft Final RFIR on Groundwater at Pantex.
- Complete ICM, RFIR, and closure on FTA Burn Pits at Pantex.
- Complete chromate study characterization project and file Final RFIR on Former Cooling Tower at Pantex.
- Complete assessment phase for the Outfall 001/Northeast Area and Miscellaneous Contaminated Sites at KCP.
- Start remediation activities at the Miscellaneous Contaminated Sites and Northeast Site/Outfall 001 Department 27 and the maintenance vehicle repair shop sump at the Kansas City Plant.
- Begin assessment activities for the 95th Terrace Site at the KCP.
- Receive NFA designation for the South Lagoon Site at the KCP.
- Demonstrate at field microwave technology and deep soil mixing technologies at the KCP.
- Accelerate interim measures clean-up of pipe gallery and acid alkaline tanks at the KCP.
- Continue assessment activities for 5 subprojects (submitted multi-site Corrective Measures Study to EPA for review) at the KCP.
- Complete remediation activities at Miscellaneous PCB sites/Miscellaneous Sites and 001 Outfall DO1 Raceway/NE Site at KCP.
- Complete 37 RFI Reports for approximately 54 SWMUs at LANL. (complete September 1996)
- Complete RFI Workplans for Pueblo, and Los Alamos Canyons at LANL. (complete December 1995).
- Continue remedial activities at all field units including completion of 52 voluntary corrective actions and expedited cleanups at LANL. (complete September 1996)

2076

III. Performance Summary - Albuquerque (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

- Complete planning activities for Technical Area 21 Buildings 3 and 4 North. Complete remediation of Technical Area 21 Buildings 146, 305, 324, and 329 at LANL. (complete September 1996)
- Complete remediation of 7 buildings associated with Technical Area 16 HEs Contaminated Facilities at LANL. (complete September 1996)
- Complete D&D activities at Technical Area 35 Phase Separator Pit at LANL (3 structures) by FY 1997.
- Continue assessment field work for ten major restoration projects at SNL/NM.
- Complete site-wide hydrogeologic characterization at SNL/NM.
- Complete 17 voluntary corrective measures at SNL/NM.
- Complete over 30 NFAs at SNL/NM.
- Complete environmental assessment at SNL/NM.
- Continue Fuel Oil Spill bioremediation and Navy Landfill ground water monitoring activities at SNL/CA.
- Provide the DOE PRP contribution for the remediation of the South Valley Superfund Site located in Albuquerque, New Mexico.
- Continue compliance activities required by three-party settlement agreements for the South Valley Superfund Site.
- Accelerate completion of assessment phase for seven major restoration projects at SNL/NM.
- Continue closure of Navy Landfill at SNL/CA.
- Continue managing the environmental restoration program at the Production Plants to ensure compliance with regulatory and DOE requirements.
- Continue technical support activities at SNL, NM, and CA locations, and at Pantex.

FY 1997 Planned Accomplishments

• Continue remediation of the Firing Sites at Pantex	$ 113
• Complete remediation of the HE Sites at Pantex	150
• Complete remediation of the Ditches and Playas at Pantex	44
• Complete remediation of USTs at other sites at Pantex	1,826
• Provide Program Management Support for Remedial Activities at Pantex	2,701
• Continue Zone 12 Groundwater Assessment and Remediation at Pantex	4,239
• Continue Miscellaneous Chemical Spill Sites Assessment and Remediation at Pantex	340
• Complete nine Field Investigations at Field Unit 1 at LANL	3,805
• Complete one CMS at Field Unit 1 at LANL	379
• Complete two Expedited Cleanups at Field Unit 1 at LANL	950
• Complete all RFI Fieldwork at Field Unit 2 at LANL	269
• Complete seven RFI Reports at Field Unit 2 at LANL	742
• Complete two Expedited Cleanups at Field Unit 2 at LANL	3,739

2077

III. Performance Summary - Albuquerque (Continued)

FY 1997 Planned Accomplishments

• Complete two Expedited Cleanups at Field Unit 3 at LANL	1,750
• Complete one CMS at Field Unit 3 at LANL	500
• Complete PH 1 Sampling and one RFI Report at Field Unit 3 at LANL	1,550
• Complete two RFI Reports at Field Unit 4 at LANL	2,460
• Complete two Expedited Cleanups at Field Unit 4 at LANL	500
• Complete 3 Field Investigations at Field Unit 5 at LANL	1,320
• Complete two RFI Reports at Field Unit 5 at LANL	250
• Complete one CMS at Field Unit 5 at LANL	280
• Complete two Expedited Cleanups at Field Unit 5 at LANL	1,300
• Continue ADS Preparation and Data Management Activities for all Field Units at LANL	1,805
• Complete and submit 33 RFI Reports at Field Unit 1 at LANL	3,512
• Complete closure of TA-35 Waste Oil Storage Pit at LANL	285
• Complete MDA P Closure Activities at LANL	1,700
• Continue Framework and Pilot Studies for all Field Units at LANL	1,541
• Continue Program Management Activities for all Field Units at LANL	11,350
• Continue D&D activities at TA-21 and D&D Planning at LANL	10,238
• Complete assessment of Septic Tanks and Drain Fields at SNL/NM	392
• Complete assessment of TA-II at SNL/NM	250
• Complete remediation of TA-III and V at SNL/NM	306
• Complete assessment of the Chemical Waste Landfill at SNL/NM	636
• Complete assessment of Mixed Waste Landfill at SNL/NM	713
• Continue assessment of TA-I at SNL/NM	3,434
• Continue activities in support of CAMU Development at SNL/NM	3,398
• Continue assessment of Central Coyote Test Area at SNL/NM	905
• Continue assessment of Foothills Test Area at SNL/NM	864
• Continue Technical Support Activities at SNL/NM	2,140
• Provide Program Management Support for Remedial Activities at SNL/NM	2,061
• Continue Program Management Support for Remedial Activities at SNL/CA	817
• Continue Fuel Oil Spill Site Remediation at SNL/CA	1,363
• Complete Closure of Navy Landfill at SNL/CA	11
• Continue compliance monitoring at SNL/CA	483

2078

III. Performance Summary - Albuquerque (Continued)

FY 1997 Planned Accomplishments	
• Continue Remediation of Maintenance Vehicle Repair Shop at KCP	1,537
• Continue Program Management Support for ER activities at KCP	1,770
• Continue Groundwater Monitoring and Treatment at KCP	994
• Continue Plating Building Remediation at KCP	423
• Continue TCE Still Area Remediation at KCP	359
• Continue Assessment and Remediation of South Lagoon at KCP	111
• Continue Remediation of Outfall 001 Raceway at KCP	184
• Complete closure activities at KCP	74
Total FY 1997, Albuquerque	$ 82,863

Explanation of Funding Changes FY 1996 to FY 1997:

- At Los Alamos National Laboratory, Environmental Restoration work will be reprioritized to focus on high-priority activities (Town Sites Remediation, Canyons Assessments) and other low-priority activities will be deferred. Decontamination and Decommissioning activities will be decelerated with focus on completion of activities currently underway and limited emphasis will be placed on new starts. $-10.9M
- At Sandia National Laboratories, decreased funding fully supports implementation of the Environmental Management Small Sites Strategy, assessment activities which may lead to No Further Action determinations and a number of Voluntary Corrective Measures to remediate solid waste management units will be deferred. $-10.5M
- At the Pantex Plant, decreased funding fully supports implementation of the Environmental Management Small Sites Strategy. The number of active sites will decrease in FY 1996 due to completion of activities. This trend will continue in FY 1997 with activities at several sites requiring minimal funding to address permit modifications and closeouts. $-3.8M

Major Issues:

- None.

23-254 96 - 66

2079

CHICAGO

I. Mission Supporting Goals and Objectives

The ER program managed through the Chicago Operations Office supports activities at three sites in two states. These sites include the Ames Laboratory (Iowa), Site A, and the Chicago Operations Office Site (Illinois).

The primary mission of the facilities under the Chicago Operations Office is research, development, and demonstration for DOE nuclear programs. This includes support of the nation's advanced reactor program and research on the fundamental properties of matter; physical, life, environmental sciences; magnetic confinement fusion and high-energy physics. By-products of this mission include transuranic waste, low-level waste, hazardous waste, and mixed waste (radioactive and hazardous combined). The Chicago Operations Office's facilities are aging, and many include former waste disposal sites that need to be assessed according to today's standards to determine the extent of environmental contamination.

The Chicago Operations Office manages, coordinates, tracks, and assists in the implementation of the environmental restoration program among the various sites. Major legal drivers include RCRA and State laws.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 2,707	$ 250	$ 933	$ +683	+273
Decontamination & Dismantlement	213	1,233	170	-1063	-86
Total Chicago	$ 2,920	$ 1,483	$ 1,103	$ -380	-26

III. Performance Summary - Chicago (Continued)

FY 1995 Accomplishments
- Completed underground storage tank removal, well plugging, abandonment and continued assessment at Site A in Illinois.
- Continued characterization at the Chemical Disposal Site to assess risk and comply with State regulations at a small site at Ames Laboratory.
- Continued S&M to maintain contaminated facilities in a safe condition.
- Provided technical support for all Chicago sites.

FY 1996 Accomplishments (To Date and Planned)
- Continue characterization at the Chemical Disposal Site to assess risk and comply with State regulations at a small site at Ames Laboratory.
- Continue S&M to maintain contaminated facilities in a safe condition.
- Provide for technical support for all Chicago sites.

FY 1997 Planned Accomplishments

• Complete characterization at the Chemical Disposal Site to assess risk and comply with State regulations at an Ames Laboratory small site	$ 200
• Continue S&M to maintain contaminated facilities in a safe condition at Site A and provide management, oversight, monitoring, and technical support for all Chicago sites	903
Total FY 1997, Chicago	$ 1,103

Explanation of Funding Changes FY 1996 to FY 1997:
- None.

Major Issues:
- None.

2081

IDAHO

I. Mission Supporting Goals and Objectives

The ER Program managed through the Idaho Operations Office primarily supports remediation activities at the Idaho National Engineering Laboratory (INEL) site. The INEL is located in southeastern Idaho along the western edge of the Eastern Snake River Plain and encompasses a semi-arid area of approximately 890 square miles. The Laboratory is a multipurpose DOE national laboratory providing primarily engineering expertise and operations/development support in the areas of spent nuclear fuel, waste management, environmental assessment and remediation, D&D of surplus facilities, alternative energy source development and technology transfer to Government and private industry. The ER budget supports a variety of legally-driven remediation activities at 98 different operable units (OUs).

These 98 OUs have been grouped into ten Waste Area Groups (WAGs) and include: (1) Test Area North (TAN), which consists of facilities for the handling, storage examination and research of spent nuclear fuel; (2) Test Reactor Area (TRA) which houses extensive facilities for studying the effects of radiation of materials, fuels and equipment; (3) Idaho Chemical Processing Plant which houses reprocessing facilities for Government-owned defense and research spent fuels; (4) Central Facilities Area (CFA) which contains many of the services for the entire site, including environmental laboratories, medical, etc.; (5) Power Burst Facility/Auxiliary Reactor Area (PBF/ARA) which served, for years, as the testing ground for nuclear fuels that power the nation's commercial nuclear reactors and is currently on standby status; (6) Experimental Breeder Reactor (EBR-I), which was the first reactor in the world to generate useable amounts of electricity; (7) Radioactive Waste Management Complex (RWMC) which is a controlled area established for the disposal of solid radioactive wastes generated in INEL operations and includes Pit 9 efforts which are aggressively investigating the use of commercially available remediation technology for application against buried transuranic waste (TRU); (8) Naval Reactors Facility which researched and developed prototype reactors for both submarines and surface ships and serves as a training school for officers and crew who operate reactors for the Navy; (9) ANL-W (ANL-W is managed through the Chicago Operations Office) which serves as the nation's testing ground for breeder-reactor technology; and (10) miscellaneous surface sites and liquid disposal areas throughout the INEL that are not included in the other WAGs.

Potential release sites addressed under ten WAGs include tanks, spills, disposal sites, wastewater disposal systems, leach pits, trenches, rubble piles, ponds, cooling towers, wells, landfills, storage areas, etc. Legal drivers at this site include a 1987 Consent Order (CO) and Compliance Agreement (CA); 1989 listing on the NPL; and a 1991 FFA/CO.

2082

II. Funding Schedule - Idaho (Continued)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 99,477	$ 87,389	$ 100,986	$ 13,597	+16
Decontamination &Dismantlement	3,897	4,676	5,913	1,237	+26
Compliance Oversight	1,635	1,900	2,360	460	+24
Total, Idaho	$ 105,009	$ 93,965	$ 109,259	$ 15,294	+16

III. Performance Summary

FY 1995 Accomplishments

- Completed 2 hazardous waste tank removals and three hazardous waste removal actions, and one radioactive sump cleanup (WAG 1).
- Performed Post ROD ground water monitoring perched water, submitted results to regulators; and performed operation and maintenance (O&M) for Warm Waste Pond Interim Action (WAG 2).
- Completed removal action at Waste Calcine Pit and awarded contract to remediate mercury contaminated soil (WAG 4).
- Completed CERCLA Interim Action activities at PBF/ARA Evaporation Pond and Waste Sump; and completed Sanitary Sewer Work Plan for ARA-03 and contaminated soil removal (WAG 5).
- Completed Pit 9 remedial design/remedial action (RD/RA) Scope of Work, Risk Assessment Remedial Objectives for non-TRU waste, and continued facility construction (WAG 7).
- Completed six Rad contaminated soil removal actions (WAG 10).
- Signed Vadose Zone ROD and completed RD/RA Scope of Work, and Phase I RD/RA Work Plan and constructed 15 monitor/extraction wells; and completed Pad A RA Report, and installed monitoring system (WAG 7).
- Finalized TAN Ground Water ROD, completed Comprehensive remedial investigation/feasibility study (RI/FS) Scope of Work and Work Plan, and continued other assessment activities (WAG 1).
- Completed Comprehensive RI/FS Work Plan and field characterization (WAG 2).
- Completed Comprehensive RI/FS Scope of Work, Work Plan and implement field work; and completed other assessment activities (WAG 3).
- Submitted CFA Sewer System Track 2 Report, completed CFA Pond field work, and finalized Landfills RI/FS Report, Proposed Plan and submitted Draft ROD (WAG 4).

III. Performance Summary - Idaho (Continued)

FY 1995 Accomplishments (Continued)

- Completed and submitted SL-1/Boiling Water Reactor Experiment I (BORAX I) draft RI/FS report, draft Proposed Plan, and draft ROD; completed Track 2 activities at five OUs, and completed installation of two monitoring wells at PBF (WAG 5).
- Completed SDA Soil Vaults Track 2 Report; completed Air Pathway Track 2 Report and Vadose Zone Track 2 S Report; completed TRU Pits and Trenches RI/FS Scope of Work, Work Plan; completed Comprehensive RI/FS screening evaluation for health and environmental risk (WAG 7).
- Completed Rad Contaminated Soils RI/FS Draft Report (WAG 10).
- Completed 22 acre Ordnance Removal Action (WAG 10).
- Performed S&M of TAN Technical Support Facilities (TSF), Materials Test Reactor (MTR), Experimental Test Reactor (ETR), CPP-740/SFE-20, CPP-601, Loft Ancillaries, CPP-640, and Waste Calcine Facility.
- Prepared environmental checklist and completed D&D plan for CPP-631, 709, 734.
- Completed D&D assessment activities and mobilized D&D equipment for Auxiliary Reactor Area I (ARA I) and continued S&M of Borax V and prepared Auditable Safety Analysis (ASA).
- Completed transport of Army Re-Entry Vehicle Facility Site NaK to ANL-W for treatment, continued D&D of ARA II, completed D&D and submitted D&D final reports for CFA-669 Hot Laundry and ARA III.
- Performed program management critical to INEL operations and FFA/CO and MSA compliance.
- Supported the FFA/CO grant to the State of Idaho.
- Funded the Shoshone-Bannock Tribe oversight expenses.
- Provided for contractor technical support for DOE-Idaho activities.
- Provided for MSA and FFA/CO reporting, administrative record, and external reviews.
- Provided for quality and compliance assurance, public participation, and data and sample management.

FY 1996 Accomplishments (To Date and Planned)

- Complete Pit 9 final SAR and technical safety review (TSR), complete facility construction, ORR, Prefinal design, RD/RA Work Plan, and initiate Limited Production Test (LPT).
- Perform Post ROD monitoring of perched water and perform O&M for Warm Waste Pond IA (WAG 2).
- Complete SL-1/Borax I ROD, submit RD/RA Scope of Work and Work Plan, and begin remedial activities.
- Complete TAN Ground Water Final ROD and develop RD/RA Scope of Work, continue TAN Injection Well IA, begin RA at TAN Ground Water, and begin TSF-09 V Tank removal action (WAG 1).
- Finalize Landfills RD/RA Scope of Work, develop preliminary RD, begin development of ASA/TSR, and begin remedial activities.
- Initiate Phase I RA for Vadose Zone, Phase I RD/RA Work Plan, SAR Documentation, operational self assessment and Phase I prefinal inspection report; and perform Pad A maintenance and monitoring (WAG 7).

2084

III. Performance Summary - Idaho (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

- Implement Comprehensive RI/FS (WAG 1).
- Prepare and submit RI/BRA for Comprehensive RI/FS Report, prepare Proposed Plan, and submit draft RI/FS Report (WAG 2).
- Complete Comprehensive RI/FS RI/BRA report, (WAG 3).
- Finalize Landfills RI/FS ROD, complete assessment at two OUs, and complete Scope of Work, and draft work plan for Comprehensive RI/FS (WAG 4).
- Complete final Track 1 investigations (WAG 5).
- Complete Ground Water Pathway AS & IT report, column tests, and monitoring; perform Air and Ground Water Pathway routine monitoring; complete TRU Pits and Trenches RI/FS Work Plan, initiate RI/BRA Report, RI/FS report and risk assessment; and complete Comprehensive RI/FS Scope of Work, Work Plan, and initiate RI/BRA report.
- Complete Rad Soils proposed plan, ROD and RD/RA Scope of Work and ROD; continue Comprehensive RI/FS; monitor well drilling; continue assessment for ORME Leach Pond; and complete Rad Soils RD/RA Work Plan (WAG 10).
- Complete solidification of treated NaK, ship to RWMC and return treatment facility to pretreatment condition; continue D&D of ARA II; initiate D&D of ARA I; complete D&D preparation activities, complete D&D and submit final D&D report for BORAX V; and initiate D&D of CPP-631, 709, 734.
- Perform S&M of TAN TSF, MTR, ETR, Loft Ancillaries, CPP-740/SFE-20, CPP-601, CPP-640, and WCF.
- Perform program management critical to INEL operations and FFA/CO and MSA compliance.
- Support the FFA/CO grant to the State of Idaho.
- Fund the Shoshone-Bannock Tribe oversight expenses.
- Provide for contractor technical support for DOE-Idaho activities.
- Provide for MSA and FFA/CO reporting, administrative record, and external reviews.
- Provide for quality and compliance assurance, public participation, and data and sample management.

FY 1997 Planned Accomplishments

• Complete Pit 9 LPT, initiate remedial action and processing Pit 9 TRU waste (WAG 7)	$ 58,697
• Finalize RD/RA Scope of Work, develop preliminary RD, and begin development of RD/RA Work Plan (WAG 1)	3,482
• Perform O&M at Warm Waste Pond Interim Action (WAG 2)	283
• Complete Comprehensive RI/FS RD/RA Scope of Work (WAG 3)	957
• Finalize Landfills RD/RA Work Plan, finalize ASA/TSR, develop procurement package, prepare and finalize RD/RA Scope of Work; prepare comprehensive RI/FS Preliminary RD, prepare and finalize RD/RA Work Plan, and perform remedial action at OU 4-12 Landfills (cap the landfills) (WAG 4)	7,729
• Complete RD and initiate remedial action at SL-1/Borax I, and initiate RD/RA activities for cleanup of injection well and leach pond at PBF (WAG 5)	3,072

III. Performance Summary - Idaho (Continued)

FY 1997 Planned Accomplishments	
• Continue Vadose Zone Phase I remedial action and Phase I remedial action report; and continue Pad A O&M (WAG7)	2,168
• Initiate RAD soils remedial action (WAG 10)	1,535
• Complete Comprehensive RI/FS Report and continue assessment activities (WAG 1)	795
• Prepare and submit Draft RI/FS ROD and Proposed Plan (WAG 2)	563
• Finalize Comprehensive RI/FS Report, Proposed Plan, and prepare and submit Draft RI/FS ROD (WAG 3)	1,842
• Complete Comprehensive RI/FS scoping, implementation, and decision phases; prepare and submit RI/FS Work Plan; and perform field work (WAG 4)	837
• Complete and submit Final Comprehensive RI/FS Scope of Work (WAG 5)	1,023
• Complete Air Pathway and Ground Water Pathway routine monitoring; complete TRU Pits and Trenches RI/BRA report, RI/FS report and initiate Proposed Plan; and complete Comprehensive RI/FS RI/BRA report (WAG 7)	3,531
• Initiate assessment for OU 10-02 ORME Leach Pond; complete Comprehensive RI/FS; monitor well drilling; complete assessment for ordnance areas; and provide general support to all WAGs (WAG 10)	2,575
• Continue D&D of ARA I and complete D&D of CPP-631. 709, 734	3,100
• Perform S&M of ARA I, ARA II, TAN, TSF, MTR, ETR, Loft Ancillaries, CPP-740/SFE-20, CPP-601, WCF, and CPP-640	1,413
• Complete D&D of ARA II	1,400
• Provide technical support for assessment and remediation activities including program formulation, program execution, system integration and network planning, project control systems, quality assurance management, sample and technical data development, waste stream tracking, configuration management, D&D efforts, and remedial design/remedial action activities	9,896
• Provide funding for FFA/CO Grant to Idaho and Shoban Grant in support of Indian Tribe coordination, provide for technical support including technical data development by the United States Geological Services and University Foundation	4,361
Total FY 1997, Idaho	$ 109,259

Explanation of Funding Changes FY 1996 to FY 1997:

- Pit 9 transitions from engineering and construction in FY 1996 to the limited production test phase and full scale remediation in FY 1997. $+10.6M

Major Issues:

- None.

NEVADA

I. Mission Supporting Goals and Objectives

The ER program managed through the Nevada Operations Office supports activities at various sites in five states. These sites include the Nevada Test Site (NTS), DOE release sites on the Nellis Air Force Range, Project Shoal site, Central Nevada Test Area, the Tonopah Test Range, (Nevada) and "Offsite" test area locations in Colorado (Rulison and Rio Blanco), Mississippi (Salmon Site), New Mexico (Gasbuggy and Gnome-Coach), and Alaska (Amchitka Island). The NTS is located about 65 miles northwest of the City of Las Vegas and encompasses 1,350 square miles of desert and mountainous terrain and is surrounded on three sides by the Nellis Air Force Range. The United States conducted 1,054 above and below-ground nuclear tests, of which, 928 occurred at the NTS. The remaining 126 nuclear tests were conducted at other sites in and outside of Nevada. Since the 1992 weapons testing moratorium, the focus has now shifted to remediation of inactive sites and facilities that were contaminated during earlier testing activities. The Project Shoal area (in 1963) and the Central Nevada Test Area (in 1968) were each the site of one underground nuclear test. The Tonopah Test Range was established in 1957 for ballistics testing of nuclear weapons, parachute delivery systems, and other non-nuclear functions for Sandia National Laboratories. Ground water at offsite nuclear test and experiment locations in Colorado, Mississippi, Nevada, Alaska, and New Mexico are monitored to ensure no migration of radionuclides occurs at these sites.

Beginning in FY 1996, an FFA/CO between the Nevada Division of Environmental Protection (State), DOE Nevada, and the Defense Nuclear Agency (which has release sites on the Nevada Test Site) will govern environmental restoration activities on the Nevada Test Site, Tonopah Test Range, DOE sites on the Nellis Air Force Range, and the two offsite test areas in Nevada -- Shoal and Central Nevada. Alaska and Mississippi guide monitoring and restoration activities at sites in those states. An AIP has also been established with the State of Nevada. Other legal drivers governing remedial action at Nevada Operations Office sites include the RCRA, CERCLA, The Atomic Energy Act, and applicable State laws.

2087

II. Funding Schedule - Nevada (Continued)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 31,502	$ 45,400	$ 51,095	$ +5,695	+13
Decontamination & Dismantlement	693	520	1,000	+480	+92
Compliance Oversight	2,348	1,971	1,097	-874	-44
Total, Nevada	$ 34,543	$ 47,891	$ 53,192	$ +5,301	+11

III. Performance Summary

FY 1995 Accomplishments

- Continued drilling near-field wells (3) to acquire data to complete hydrogeologic model, tested various model scenarios to serve as monitoring wells; designed and began implementing monitoring network based on the model results.
- Completed characterization and conducted planning for Double Tracks interim action soil clean-up in 1996.
- Continued environmental restoration site inventory; completed closure of U3fi RCRA site; removed 12 USTs and completed characterization and removal of 10 abandoned septic tanks.
- Continued long-term hydrological monitoring at eight off-site nuclear test sites in five States, conducted limited characterization for the Salmon Site, and began remediation of drilling mudpit at Rulison Site in Colorado.
- Completed AIP with State of Alaska.
- Completed D&D Title I design for one facility; continued characterization for two additional facilities and completed D&D of one facility.
- Removed and rendered harmless over 20,000 pieces of ordnance from 5 sites on the Tonopah Test Range.
- Provided program management support for AIP funding, program and project management, and completion of DOE/Nevada Site-wide Environmental Impact Statement (EIS).

FY 1996 Accomplishments (To Date and Planned)

- Complete negotiations for FFA for DOE facilities/sites in Nevada.
- Complete interim soil removal action at the Double Tracks Site and begin characterization of plutonium contaminated sites on Tonopah Test Range.
- Continue drilling near-field wells (4) to acquire data for hydrogeologic model; complete hydrogeologic model and design and begin implementing monitoring network based on results of the model.
- Remove 12 USTs; complete closure of one RCRA site and characterize two more; and remediate two sites on the Tonopah Test Range.

2088

ENVIRONMENTAL RESTORATION - DEFENSE (Continued)

III. Performance Summary - Nevada (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

- Continue long-term hydrological monitoring at eight off-site nuclear test sites in five States, begin remediation of three mudpits at Central Nevada Test Area in Nevada, and properly abandon the emplacement shaft at the Project Shoal Site.
- Increase geological coring, and accelerate ground water modeling, risk assessments, and database management system development and implementation of monitoring network. Complete regional groundwater model for the NTS.
- Complete field for site characterization at Salmon Site in Mississippi.
- Complete remediation of the petroleum contaminated mudpit at Rulison Site in Carlsbad.
- Provide program management for FFA management, program and project management, and completion of the Environmental Management EIS.

FY 1997 Planned Accomplishments

• Continue drilling near-field wells for implementing monitoring networks for ground water impacted by underground nuclear testing	$ 22,727
• Remove 12 USTs; close 2 RCRA sites, start closure of two more, and perform characterization of two additional on NTS. Continue implementation of Tonopah Test Range workplan	10,600
• Finish remediation and implementation of ground water monitoring networks at the Project Shoal and Central Nevada Test Area Offsites; conduct monitoring at 8 offsites in 5 states	4,481
• Begin interim action cleanups of the "Clean Slate" Plutonium soil contamination sites at Tonopah Test Range, begin work on hydrodynamic test sites, and do revegetation of Double Tracks	8,401
• Perform S&M on seven facilities on NTS	1,000
• Provide program management support for FFA/CO management, program and project management, and AIPs with States of Nevada, Alaska, and Mississippi	5,983
Total FY 1997, Nevada	$ 53,192

Explanation of Funding Changes FY 1996 to FY 1997:

- Accelerate remediation of Clean Slate Plutonium soil sites on Tonopah Test Range and begin characterization of hydrodynamic soil sites.
- Finish additional RCRA closure site, start closure of another, and begin characterization of another on the Nevada Test Site. $+5.3M

Major Issues:

- None.

2089

OAKLAND

I. Mission Supporting Goals and Objectives

The ER Program managed through the Oakland Operations Office supports activities in the state of California at three defense related locations. These locations include: Lawrence Livermore National Laboratory (LLNL) consisting of the Livermore Site and Site 300, a small portion of the Santa Susana Field Laboratory (SSFL)/Energy Technology Engineering Center (ETEC); and technical support efforts at Oakland Operations Office.

LLNL occupies two sites in northern California. The Livermore Site has an area of approximately 1 square mile and is located 40 miles east of San Francisco, just east of the city of Livermore. Site 300, which comprises approximately 11 square miles, is located 15 miles southeast of the Livermore Site. Both LLNL sites are on the NPL. LLNL is a multi-disciplinary research laboratory, specializing in weapons research and development. ER activities at LLNL have been divided into 7 different OUs (1-Livermore Site; 6-Site 300). RAs at LLNL primarily focus on contaminated ground water at the two LLNL sites.

The SSFL is a 2,700 acre site located in Simi Valley, California, and is owned and operated by Rockwell International. Approximately 90 acres of the site has been furnished to the Department by Rockwell, for ETEC. ETEC has provided management, engineering, and project oversight on a wide range of Departmental programs involving the testing of nonradioactive components. Major environmental restoration efforts focus on cleanup for unrestricted use of the Rockwell Hot Lab, which supported past Defense Programs activities.

The Oakland Operations Office manages, coordinates, tracks, and assists in the implementation of the environmental restoration program among the multiple sites. In addition, the Oakland Operations Office manages and implements grants for the State of California oversight activities. Major legal drivers at Oakland sites include FFAs, RCRA, the Toxic Substances Control Act, California Porter-Cologne Act, and the Clean Water Act.

II. Funding Schedule - Oakland (Continued)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 25,012	$ 23,392	$ 22,687	$ -705	-3
Decontamination & Dismantlement	700	3,500	1,000	-2,500	-71
Compliance Oversight	325	200	394	+194	+97
Total, Oakland	$ 26,037	$ 27,092	$ 24,081	$-3,011	-11

III. Performance Summary

FY 1995 Accomplishments

- Continued operation for five ground water/soil vapor pump and treat systems essential for on-site plume containment as required by the ROD; completed design of pipeline extensions for Treatment Facilities (TF) A, B, and C and connect wells; submitted draft compliance monitoring plan; completed construction and begin operation/maintenance of Building 518 vapor extraction system; completed design work for TF G-1 as part of ROD requirements for risk reduction and source removal; and continued regulatory compliance and program management for activities at LLNL Livermore Site.
- Continued monitoring and analysis of the tritium plume in the soil near Building 292 source area, conducted source area investigations around Buildings 419 and 331 to meet ROD requirements and shutdown of TFF fuel hydrocarbon vapor extraction system at LLNL Livermore Site.
- Completed final feasibility studies (FS) for two OUs, one draft final Proposed Plan, and one draft and final (interim) ROD; continued three interim actions to prevent further containment migration based on Baseline Risk Assessment; submitted draft basin plan amendment to exempt Building 834 from ARARs; achieved regulatory approval for natural remediation for capping of Pit 6 (OU3); and provided essential program management activities at LLNL Site 300.
- Completed decontamination of 4 hot cells and decon rooms, service gallery, support drain removal, removal of RA exhaust system, operating gallery and mockup area, and decontamination of the basement at the Rockwell International Hot Lab (Building 020) at SSFL.
- Provided technical support services to Oakland and payments for State grants.

2091

III. Performance Summary - Oakland (Continued)

FY 1996 Accomplishments (To Date and Planned)

- Continue regulatory compliance activities under the FFA, such as monitoring, sampling, operations and maintenance, community relations, risk analysis, and report preparation; continue operation, data collection and interpretation and well installation at five treatment facilities and Building 518; support construction, activation, and operation of Treatment Facility C-North pipeline and Treatment Facility G-1; issue final compliance monitoring plan, complete the Draft Contingency Plan, conduct ground water characterization, hydrogeologic analyses, capture design, treatment process design, and small equipment purchases for Trailer 5475 area (all regulatory requirements in the Remedial Action Implementation Plan schedule); and provide program management support at the LLNL Livermore Site.
- Continue assessment field work for three of six OUs at the LLNL Site 300; develop, prepare and complete one draft and final Proposed Plan for General Services Area (GSA) and, one draft ROD for GSA; continue ground water sampling and analysis and water level measurements to monitor hydrogeology; submit monthly reports to regulators; continue removal actions at Eastern GSA Area and Central GSA Area; complete Building 834 Interim Action; hold three public meetings on Site 300 ER activities, and provide for program management activities.
- Complete decontamination of attic, storage/airlock area, six rooms, roof, loading dock, asphalt, concrete pads, outside yard, office, and change rooms at the Rockwell Hot Lab (Building 020) at SSFL.
- Provide technical support services for the Oakland Operations Office and State grants.
- Prepare and submit to regulators capping design document for Pit 6, install monitoring wells in building 815 area to demonstrate contamination is not migrating offsite, preparation of document for completion of characterization work at building 850.

FY 1997 Planned Accomplishments

• Provide for regulatory compliance activities such as reporting, sampling and analysis, risk analysis, ground water monitoring, and quality assurance and control; supports O&M of six ground water treatment facilities and one soil vapor treatment facility at Building 518 at levels identified in ROD; complete and issue contingency plan and Remedial Design Report No. 4 to regulators; begin process for five-year review of ROD; and provides for associated program management costs for LLNL Livermore Site	$ 12,539
• Finalize High Explosive (HE) Burn Pit Closure Plan procurement bid package in compliance with RCRA requirement; continue O&M of treatment facility at Building 834 and test technologies while monitoring progress of cleanup; complete ROD for GSA (OU1) and implement remedial action; complete capping of Pit 6 (OU3) as removal action; provide for implementation of remedial alternatives for process area/Bldg 815 (OU4); and Building 850/Pits 3 and 5 (OU5); complete all characterization work for Building 832 Canyon (OU6); and continue site wide monitoring requirements; and provide for program management costs for LLNL Site 300	9,973
• Complete Rockwell International Hot Lab D&D (small sites initiative), final survey, independent verification, release, demolition, and site regrading at SSFL	1,000
• Provide direct contractor support to the Oakland Operations Office for cost estimating, reporting, and technical review and provide funding to the State of California agencies for oversight activities	569
Total FY 1997, Oakland	$ 24,081

2092

III. Performance Summary - Oakland (Continued)

Explanation of Funding Changes FY 1996 to FY 1997:
- Decrease in D&D funding due to small site acceleration funding received in FY 1996 for completion of Rockwell Hot Lab at ETEC in FY 1997 (-$2.5M)

Major Issues:
- None.

2093

OAK RIDGE

I. Mission Supporting Goals and Objectives

The ER Program managed through the Oak Ridge Operations Office consists of five sites including Y-12, Oak Ridge National Laboratory (ORNL), K-25, and the Oak Ridge Operations Office. The Oak Ridge Reservation (ORR) consists of three sites (K-25, Y-12, and ORNL). The ORR covers approximately 37,000 acres of Oak Ridge, Tennessee, and was placed on the NPL in 1989. During its 50 years of operation, portions of the ORR have become contaminated with radioactive elements.

Y-12 is approximately 811 acres and is located about 2 miles southwest of Oak Ridge, Tennessee. Y-12 has 15 OUs within 3 areas; Chestnut Ridge, Upper East Fork Poplar Creek, and Bear Creek Valley. The types of contamination include radioactive, hazardous, and mixed wastes.

ORNL is approximately 2,900 acres and is located about 10 miles southwest of Oak Ridge, Tennessee. ORNL is divided into 20 WAGs. The types of contamination include low-level radioactive material, organic solvents, corrosive wastes, PCBs, and heavy metals.

The K-25 site occupies 1,700 acres adjacent to the Clinch River, about 13 miles west of Oak Ridge. It was originally built to enrich uranium hexafluoride for Defense Programs. The majority of the 125 major buildings on the site are now inactive since production ceased in 1987. Only a small portion of K-25 activities are funded under the Defense appropriation including centrifuge and landlord efforts. The majority of K-25 funding is requested under the Uranium Enrichment Decontamination and Decommissioning Fund appropriation.

The Oak Ridge Operations Office manages, coordinates, tracks, and assists in the implementation of the ER program among the various sites. Efforts related to recycling of materials from the various Oak Ridge sites are also being supported, as well as crosscutting integration efforts related to the Oak Ridge sites. In addition, the Oak Ridge Operations Office manages oversight agreements with the States of Tennessee, Ohio, and Kentucky.

2004

II. Funding Schedule - Oak Ridge (Continued)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 55,957	$ 63,603	$ 58,613	$ -4,990	-8
Decontamination & Dismantlement	15,427	15,345	13,632	-1,713	-11
Landlord	8,810	6,353	4,243	-2,110	-33
Compliance Oversight	1,175	1,088	0	-1,088	-100
Total, Oak Ridge	$ 81,369	$ 86,389	$ 76,488	$ -9,901	-11

III. Performance Summary

FY 1995 Accomplishments

- Completed Kerr Hollow Quarry ROD at Y-12; WAG 5 ground water seeps treatment unit; and WAG 5 RI/FS at ORNL; completed WAG 1 Surface Impoundment operable unit RI/FS at ORNL.
- Conducted support activities including waste management; AIP grants; regulatory integration and technical support for risk assessment; supported mixed waste disposal initiative; initiated analytical lab upgrades; site-wide ground water compliance programs; and site-wide Oak Ridge Environmental Information Systems.
- Completed Lower East Fork Poplar Creek (LEFPC) Proposed Plan and ROD; ACAP phase II field work initiation and complete South Campus Facility RI/FS, and proposed plan, performed removal action at Sokoay Drums. Lower Watts Bar Rod completed.
- Completed the RMPE Mercury Source Elimination Project interim action at Y-12; and completed the Streamline Asbestos Removal from Plant 9201-4 at Y-12; and completed decommissioning of electrochemical machine room basement in Plant 9201-4 at Y-12.
- Conducted K-25 landlord support activities.

FY 1996 Accomplishments (To Date and Planned)

- Complete the CEER small site remedial activities.
- Complete one assessment, Chestnut Ridge OU2 Filled Coal Ash Pond at Y-12 and continue RMPE source elimination projects.
- At ORNL, complete one assessment, WAG 5 Old Hydrofracture Tank Sludge Removal, and one interim action, WAG 1 Tank Content Removal; complete Surface Impoundment OU Proposed Plan; complete WAG 4 Proposed Plan and ROD; and complete WAG 1 Process Waste Surge Tank Project.

III. Performance Summary - Oak Ridge (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

- Conduct Wetlands testing and complete South Campus Facility Proposed Plan and approve no further investigation for Freels Bend Area.
- Initiate LEFPC disposal design and remedial design report; initiate LEFPC removal action work plan and remedial design report; and continue removal action at ACAP. Complete RI/FS for Clinch River.
- Conduct support activities including waste, treatment, storage and disposal activities at Y-12, K-25, and ORNL; AIP grants; regulatory integration and technical support for risk assessment; support mixed waste disposal initiative; continue analytical lab upgrades; site-wide ground water compliance programs; and site-wide Oak Ridge Environmental Information Systems.
- Complete two D&D Hazard Abatement (Tray Room Cleanup and Steam Coil Removal) interim actions at Y-12.
- Continue Landlord support activities at K-25.
- Complete remedial actions including Building 9409-5 Tank Storage Area RCRA Closure and Upper East Tank Poplar Creek Interim Drum Yard at Y-12.

FY 1997 Planned Accomplishments

• Conduct assessment and characterization activities for Bear Creek OU and start Remedial Action activities at Chestnut Ridge OU2 required by the FFA; perform interim actions for the Y-12 RMPE program for regulatory compliance .	$ 24,042
• Continue LEFPC disposal design and site removal design; continue LEFPC borrow area design; and complete LEFPC removal action work plan and remedial design report	9,600
• Conduct assessment and characterization activities for North and South Tank Farms and initiate construction for inactive tanks and tank content removal; complete surface impoundment OU ROD, and the WAG 2 RI; complete source characterization for remaining pits at WAG 2	29,600
• Conduct support activities including waste management; AIP grants; regulatory integration and technical support for risk assessment; site-wide ground water compliance programs; carry out limited efforts for recycling of materials from the various Oak Ridge sites; site-wide Oak Ridge Environmental Information Systems; and conduct K-25 landlord support activities	13,246
Total FY 1997, Oak Ridge	$ 76,488

Explanation of Funding Changes FY 1996 to FY 1997:

- Completion of decommissioning of six cooling towers at K-25. (-$10.0M)

Major Issues:

- None.

2096

OHIO

I. Mission Supporting Goals and Objectives

The ER Program, managed through the Ohio Field Office, supports activities at four sites in the State of Ohio. These sites are: Fernald, Battelle Columbus Laboratory (BCL), Reactive Metals Incorporated (RMI) and the Ohio Field Office.

The Fernald Environmental Management Project (FEMP) is a Government-owned, contractor-operated Federal facility that produced high-purity uranium metal products for the DOE and its predecessor agencies during the period 1951 to 1989. Thorium was also processed, but on a smaller scale, and is still stored on site. Uranium processing operations at the FEMP were limited to a fenced, 136-acre tract known as the Production Area. The remaining FEMP site consists of waste storage and disposal areas and forest and pasture lands, a portion of which is leased for livestock grazing. In November, 1989 the EPA placed the FEMP site on the NPL and in April 1990, DOE and EPA entered into a CA (since amended) for site remediation. The CA created five OUs covering total site remediation. The Fernald Environmental Management Project has implemented an accelerated cleanup schedule with site remediation scheduled for 2005 and saving approximately $2.6 billion.

The BCL site is located in Columbus, Ohio. Research and development work was performed at its facilities for the Department and its predecessors. The buildings are privately owned by Battelle and the facility retains an active NRC license for possession of special nuclear material. Fifteen buildings, or portions thereof, are radioactively-contaminated.

The RMI site, located in Ashtabula, Ohio, is owned and operated by the RMI Titanium Company, and is contaminated with both radiological and hazardous materials resulting from previous operations from the DOE to shape nuclear materials. The environmental restoration mission at the site is to D&D the site for unrestricted use.

The Ohio Field Office manages, coordinates, tracks, and assists in the implementation of the ER program among the various sites. In addition, the Ohio Field Office manages oversight activities with the State of Ohio.

II. Funding Schedule - Ohio (Continued)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 154,209	$ 196,388	$ 181,551	$ -14,837	-8
Decontamination & Dismantlement	27,669	36,044	49,260	13,216	+37
Landlord	61,237	42,373	56,364	13,991	+33
Total, Ohio	$ 243,115	$ 274,805	$ 287,175	$ +12,370	+5

III. Performance Summary

FY 1995 Accomplishments

- Completed D&D of Building KA-4; continued D&D of Building KA-5; and initiated D&D at KA-1 at BCL.
- Provided for low-level waste (LLW) shipments to an approved DOE site to reduce risk of further site contamination, and maintained waste minimization activities at BCL.
- Performed significant characterization and assessment, and completed required waste and soil shipments at RMI.
- Continued ongoing RI/FS efforts for OU3 and OU5; completed RODs for OU1, OU2, and OU4; completed two and continued six removal actions; completed the CDR and initiated Title 1 for OU1 at Fernald.
- Initiated and completed the OU1 RD workplan; initiated the OU1 RA workplan; initiated OU2 RD Workplans; completed the OU4 RD Workplan; and initiated the OU5 RD/RA Workplan at Fernald.
- Continued three detailed designs for the Inactive Flyash Pile and complete the disposal facility predesign investigation for OU2; continued three CDRs for ground water, soils, and sediments; completed three support projects; continued the Equipment Cleanout Program for OU3; and initiated operation of the AWWT project for OU5 at Fernald.
- Processed and disposed of 45,000 FT3 of LLW and 2,000 FT3 of mixed waste; and continued hazardous waste activities to comply with RCRA at Fernald.

2098

III. Performance Summary - Ohio (Continued)

FY 1995 Accomplishments (Continued)

- Continued project management support including subcontractor project management activities at Fernald.
- Continued health and safety support, emergency preparedness, site services, public affairs, quality assurance, training and support projects, including the asbestos management construction activities at Fernald.
- Provided for activities in support of ongoing lawsuits at Fernald.
- Provided funding for State of Ohio EPA oversight activities at Fernald.
- Continued environmental monitoring in support of restoration activities, laboratory services, Clean Air and Clean Water Act compliance effort, and support projects at Fernald.
- Provided for maintenance activities, utilities operation including boiler, water supply, sanitary sewer, and sump, security, procurement, and other facility services at Fernald.
- Completed the Uranyl Nitrate Hexahydrate Neutralization.

FY 1996 Accomplishments (To Date and Planned)

- Obtain NRC approval on the site characterization report and the site decommissioning plan at RMI.
- Disposition backlog uranium oxide, residues, and soils at RMI.
- Complete CAMV corrective measures assessment and develop technical specifications for decommissioning activities at RMI.
- Complete waste stream assessments for equipment and construction debris at RMI.
- Complete decontamination activities in six of the nine King Avenue building, resulting in the overall completion of decontamination work at the entire King Avenue site. Eight out of eight FY96 Performance Measures to be completed on time or ahead of schedule.
- Issue final ROD for OU5 and issue draft and final ROD for OU3; complete two and continue four removal actions; and initiate remedial action activities for OUs 1,2, and 4.
- Complete the OU1, OU2, and OU4 RA workplan; and initiate RD/RA workplan for OU3; complete OU5 RD workplan and initiate OU5 RD workplan.
- Initiate operation of the South Plume Recovery Wells and the Perched Water System; complete construction of the OU4 Vitrification Pilot Plant; and continue to operate site waste water treatment systems (including the AWWT, IAWWTs, Plant 8 Sump, General Sump and BDN/ETS) and the South Plume Well Field.
- Complete construction of a new sludge dewatering facility and initiate operations; and complete construction and begin remediation operations of the well field in the South Field area.
- Process and dispose of 40,000 DE's of LLW; process 2,000 DE's of mixed waste, and complete Thorium Overpack disposition.
- Complete construction and initiate operation of OU4 vitrification pilot plant.
- Complete Plants 1 and 4 D&D Projects; initiate operation of plant infrastructure; complete limited disposal facility design activities; complete limited railroad upgrade activities; and accelerate Safe Shutdown activities.
- Continue project management support including subcontractor project management activities and prepare for 10 year acceleration schedule.
- Complete restoration payments to Battelle, the facility private owner, for physical damages caused by decontamination activities.
- Project ramp-up to initiate the decontamination activities at West Jefferson North (consisting of three buildings and associated grounds). Buildings include a retired reactor building (JN-3) and a building (JN-1) which houses the largest Hot Cell facility built east of the Mississippi.
- Provide for surveillance and maintenance activities including environmental monitoring of the West Jefferson North site.

2099

III. Performance Summary - Ohio (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

- Continue health and safety support, emergency preparedness, site services, public affairs, quality assurance, training and support projects, including the initiation of asbestos management construction activities.
- Provide for activities in support of ongoing lawsuits.
- Provide funding for State of Ohio EPA oversight activities.
- Continue environmental monitoring in support of restoration activities, laboratory services, Clean Air and Clean Water Act compliance effort, and support projects.
- Provide for maintenance activities, utilities operation including boiler, water supply, sanitary sewer, and sump, security, procurement, and other facility services.
- Disposition of 11,430 cubic feet of LLW and 577 cubic feet of RMW at BCL.

FY 1997 Planned Accomplishments

- Complete soil assessments for Areas C and D, Phase I equipment and building remediation, and 3 interim actions at RMI ..... $ 20,284
- Provide for environmental D&D activities at BCL 482
- Complete OU1 Treatment Plant Construction and initiate facility startup; complete Operational Readiness Review/Readiness Assessment and Title III Design for OU1; obtain Railroad Engine; and award contract and complete on site rail upgrade at Fernald 23,313
- Complete the OU2 RD/RA Workplans for all subunits; complete two OU2 Title I/II design packages and initiate Title III support; continue remediation operations of the wells in the South Field area, and initiate construction of the OU2 disposal facility and initiate post maintenance and monitoring at the disposal facility; and complete one OU2 remedial action at Fernald 17,776
- Initiate operation of the OU4 Vitrification Plant; continue construction activities for the OU4 Treatment Facility and purchase Treatment Facility equipment at Fernald 26,600
- Continue to operate site wastewater treatment systems including the AWWT, IAWWTs, AWWT Dewatering facility and the South Plume Well Field; expand the AWWT facility; continue RCRA , Design, Monitoring, Evaluation Program Plan (DMEPP) and South Plume and South Field area ground water monitoring; complete activities for Well Field design, off property excavation, and the Sewage Treatment Plant; initiate startup of injection wells at Fernald 24,661
- Dispose 32,400 cubic feet LLW and treat and dispose of 30,000-90,000 tons of waste from OU1 and complete disposition of nuclear material waste inventory at Fernald 16,200

2100

III. Performance Summary - Ohio (Continued)

FY 1997 Planned Accomplishments (Continued)	
• Complete the OU3 RD/RA Workplan; continue safe shutdown, complete SSD of one Facility and complete D&D of two facilities activities; and complete and issue Plant 4 final report at Fernald	52,342
• Continue project management support activities including health and safety support, emergency preparedness, site services, public affairs, quality assurance, training and support projects, including asbestos management construction activities; provide for activities in support of ongoing lawsuits; and State of Ohio EPA oversight activities. Initiate 10 year accelerated schedule	56,417
• Continue environmental monitoring in support of restoration activities, laboratory services, Clean Air and Clean Water Act compliance effort, and support projects; provide for maintenance activities, utilities operations including boiler, water supply, sanitary sewer, and sump, security, procurement, and other facility services at Fernald	49,100
Total FY 1997, Ohio	$ 287,175

Explanation of Funding Changes FY 1996 to FY 1997:
- Acceleration at Fernald results in increased D&D and Landlord activities and reduction in remedial action activities (+4.6M)
- Increase at RMI reflects movement of D&D phase (+$10.9M)

Major Issues:
- None.

2101

RICHLAND

I. Mission Supporting Goals and Objectives

The Environmental Restoration program managed through the Richland Operations Office supports activities at the Hanford site and the Richland Operations Office. Both sites are located in the State of Washington. The Hanford Restoration and Remedial Action Program includes remediation of inactive waste sites and D&D of surplus facilities at the Hanford site in southwestern Washington. Hanford covers 560 square miles and includes approximately 1,400 waste sites identified as potentially in need of remediation, and over 100 surplus facilities requiring decontamination. Restoration includes S&M, characterization, assessment, remediation, technology demonstration, and disposition of radioactive, hazardous, and mixed waste from various sites and facilities. Activities will also be carried out utilizing funds received from a non-federal source. The Department received $6.2 million from the Washington Public Power Supply System for eventual Decontamination and Decommissioning of part of the Hanford Generating Plant which was operated in conjunction with the N Reactor to produce power for the Washington State area. This funding will be used in FY 1997 to initiate cleanup and/or removal of radioactively contaminated systems at the Hanford Generating Plant and for characterization and remediation of any related contaminated solid waste management units. The Richland Operations Office manages, coordinates, tracks, and assists in the implementation of the ER program at Hanford. In addition, the Richland Operations Office implements and manages oversight activities with the State of Washington.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 130,272	$ 113,839	$ 90,863	$ -22,976	-20
Decontamination & Dismantlement	44,916	41,304	37,036	-4,268	-10
Long-term S&M	0	90	200	+110	+122
Compliance Oversight	1,893	2,200	2,700	+500	+23
Total, Richland	$ 177,081	$ 157,433	$ 130,799	$ -26,634	-17

2102

III. Performance Summary - Richland (Continued)

FY 1995 Accomplishments

- Performed two expedited removal actions at the 200 Area (CCl4 soil) and the 100 Area (N Springs).
- Completed remediation of the 1100 Area per the ROD.
- Received CERCLA ROD for the Environmental Restoration Disposal Facility (ERDF).
- Began construction of the ERDF.
- Performed remedial design work at 300-FF-1.
- Completed treatability testing at 200-UP-1.
- Began remedial design at selected waste sites in 100-DR-1 and 100-HR-1.
- Removed 3800 cubic yards of contaminated soil from 100-BC-1.
- Submitted 100-NR-1 and -NR-2 Work Plans to regulators.
- Completed N Springs barrier wall constructability test program.
- Installed and began operation of 50 gpm pump & treat system at N Springs.
- Submitted reports on N cribs skyshine abatement alternatives and N Springs ground water modeling.
- Completed Focused Feasibility Studies for ten OUs and Proposed Plans for nine OUs.
- Completed work plans for 3 OUs.
- Completed construction of the W-025A trench disposal facility.
- Performed/completed remediations under the Radiation Area Remedial Action (RARA) and Asbestos Abatement programs.
- Performed N Reactor minimum compliance, regulatory response activities, basin cleanout and preparation of NEPA Environmental Assessment.
- Completed removal of all contaminated equipment and radioactive and hazardous materials from the 190-D complex; continued plutonium inventory removal activities at 232-Z.
- Completed demolition of the 190-D complex; complete roof repairs and electrical upgrades on 105-D, 105-DR, 105-H, and 105-F.
- Conducted D&D/S&M for the 100 and 200 Areas.
- Provided for facility infrastructure upgrades, RI/FSs and ERA support studies and equipment, laboratory instrumentation upgrades, and Hanford Barrier and ground water technology testing.
- Provided for DOE-Richland, States and U.S. Army Corps of Engineers staffing, quality assurance, and Hanford Remedial Action EIS.
- Provided for program management program controls, baseline planning, records and data management and geographic information systems.

FY 1996 Accomplishments (To Date and Planned)

- Continue or complete remedial design for waste sites in 5 OUs.
- Complete RFI for 200-PO-1.
- Continue operation of N Springs pump & treat system.
- Begin 1301/1325 Crib Closure/CMS for N Area (CMS complete 3/97).
- Complete Focused Feasibility Study/Proposed Plan for 100-DR-2; continue ground water sampling, analysis and data validation.

2103

III. Performance Summary - Richland (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

- Procure remediation equipment and perform remedial actions at 3 OUs.
- Perform 100-NR-1 and -NR-2 Corrective Measures/Focused Feasibility/Closure Plan studies (CMS complete 11/96).
- Perform remediation activities at 300-FF-1 and FF-5 OUs, and perform post-remediation ground water monitoring at 1100-EM.
- Complete construction of the ERDF.
- Conduct two ground water and one soil treatability tests in the 100 Area.
- Continue CCl4 vapor extraction at 200-ZP-2.
- Complete Proposed Plan for 100-IV-2 and 100-IV-6.
- Issue interim response measure proposed plan and focused feasibility study for 200-UP-2; issue ground water reports for I-129 and the 200 Common Area.
- Begin construction of a RCRA-equivalent barrier at 200-BP-1 (to be completed in FY 1997).
- Provide engineering, technical support, construction management, administration, and program management during ERDF construction.
- Perform cold testing at 300-FF-2 at the 618-10 burial ground.
- Complete treatability test plan for 300-FF-2; start feasibility study for 300-FF-2.
- Perform ground water remediation at 200-UP-1 and 200-ZP-1 at full-scale following treatability tests.
- Issue CERCLA RODs for 300-FF-1 and 300-FF-5 OUs.
- Perform S&M and corrective maintenance activities, safety assessments of inactive facilities in the 100 and 200 Areas.
- Perform remediations under the RARA and Asbestos Abatement programs.
- Initiate and complete demolition of the 183-C facility.
- Continue deactivation activities, cleanout of fuel storage basin, deactivate and stabilize twenty-one facilities (fourteen remain for FY 1997), and continue waste minimization, segregation, and compaction activities at N Reactor.
- Complete Phase I decontamination of 233-S; complete plutonium inventory reduction at 232-Z.
- Complete demolition of the 183-H Solar Basins.
- Provide program management for all Richland Hanford ER activities.
- Provide for the State of Washington grant.
- Provide for quality assurance and data management, direct support, and NEPA documentation.
- Provide for infrastructure development (general engineering, equipment, laboratory support), development and testing of technologies, and laboratory upgrades.
- Carry out NEPA planning and documentation for outyear activities.

2104

III. Performance Summary - Richland (Continued)

FY 1997 Planned Accomplishments	
• Treat ground water through the year and dispose of wastes at 200-ZP-1	$ 1,517
• Continue operation of vapor extraction to remove approximately 24,000 lbs. of carbon tetrachloride from soil at 200-ZP-2	1,454
• Dispose of waste at 200-UP-1 ground water treatment system, and upgrade system to full scale	1,594
• Complete construction of RCRA-equivalent barrier at 200-BP-1	630
• Continue ground water sampling, analysis, and data validation in the 100 Area ground water operable units	2,434
• Perform characterization and assessment at 2 OUs in the 100-HR Area	873
• Perform remedial design or remedial action planning at the HR, BC, and DR reactor areas	2,403
• Perform remedial actions at the BC and HR reactor areas, including excavation and removal of over 50,000 loose cubic yards of contaminated soil	13,991
• Complete and submit draft 1301/1325 Crib Closure/CMS for 100 N Area	108
• Complete revision of 100-NR-1 and NR-2 CMS/FFS/Closure Plan	108
• Continue remediation of 300-FF-1; consolidate waste at process ponds and trenches	8,880
• Continue operation of ERDF and transportation of wastes to ERDF	15,274
• Perform limited long-term surveillance and monitoring at 1100 Area and 300-FF-5	198
• Complete 300-FF-2 Feasibility Study	176
• Continue or complete 2 treatability tests at 100-HR-3 and 1 at 100-KR-4	8,074
• Perform 100-NR remediation and remedial action planning	2,454
• Complete deactivation of N Reactor facilities, including spent fuel basin cleanup; reactor for eventual D&D	15,422
• Complete 5 remediations and project management under the Asbestos Abatement Program; perform S&M activities on selected RARA sites	3,516
• Conduct D&D in the 100 and 200 Areas	3,648
• Complete decommissioning of 3 buildings in the 100 and 200 Areas; complete demolition of 8 buildings in the 100 Area and 2 in the 200 Area	8,496
• Provide technical support to eliminate high hazards identified in Risk Assessment Report	2,817
• Initiate definitive engineering for long-term reactor block isolation for interim safe storage	6,682
• Provide overall program management including safety and health engineering, assessment and environmental compliance activities, baseline maintenance, sample and data management, public involvement, design engineering, strategic planning and program reporting	30,050
Total FY 1997, Richland	$130,799

III. Performance Summary - Richland (Continued)

Explanation of Funding Changes FY 1996 to FY 1997: $-26,254

- FY 1997 is the first year in which DOE can perform budget planning for implementation of the ER refocusing, which was negotiated with the regulators in FY 1995. The refocusing places a major emphasis on clean-up of near river contaminated sites and protection of ground water, as opposed to assessment activities.

Major Issues:

- None.

ROCKY FLATS

I. Mission Supporting Goals and Objectives

The Rocky Flats Environmental Technology Site is located 16 miles northwest of Denver, Colorado. The site comprises approximately 11 square miles, including a buffer zone between the site and its boundaries. The plant was used to shape plutonium, fabricate alloy, and operate conventional metal production processes. When operations ceased, large amounts of plutonium, plutonium compounds, and metallic residues remained in the production lines, tanks, and process furnaces. In addition, contamination exists in soil, sediments and groundwater at the site. With the discontinuation of nuclear weapons component production at Rocky Flats and consolidation of non-nuclear production activities to other sites, Rocky Flats' new mission is to manage waste and materials, and to clean up and convert the site to beneficial use in a manner that is safe, environmentally and socially responsible, physically secure, and cost effective.

The highest priority at Rocky Flats continues to be the protection of workers, the public, and the environment from exposure to plutonium and the potentially hazardous materials, and to safeguard plutonium from terrorists and espionage. This plus compliance with laws, legal agreements, DOE Orders, and other requirements that affect conduct of site activities are core activities, which form a significant portion of the site budget.

In 1997, the budget request consolidates all activities at the Rocky Flats site under the Environmental Restoration area of the budget. This includes remediation efforts, waste management, deactivation activities, and all other site support.

Liability reduction activities will focus on reducing risks and/or cost of core activities. Key risk reduction activities and strategies at the site include: preparing and packaging material for shipping hazardous and excess materials off site, consolidating plutonium in safer and easier to secure locations, converting plutonium liquids to a solid, safer and easier-to-handle form, providing ventilation of containers that have potential of hydrogen generation, and removing sources of contamination in the ground to cease or inhibit further spreading.

Key core cost-reduction activities include: deactivating high upkeep facilities that are no longer needed, re-engineering processes and procedures for greater efficiency, and installing labor-saving technology and equipment.

The waste management program focuses on safe, compliant, and cost-effective waste minimization, storage, treatment, and disposal of low-level, mixed low-level, transuranic, mixed transuranic, hazardous, and sanitary waste. Rocky Flats has approximately 600 m3 of transuranic waste, 12,000 m3 of mixed low-level waste, 550 m3 of transuranic-mixed waste, and 5400 m3 of low-level waste stored on site. The program's near-term goals involve continuing treatment of hazardous and sanitary waste, offsite shipment and disposal of low-level waste, development of treatment capacity for mixed waste, and characterization and certification of transuranic and mixed transuranic waste for ultimate disposition at the Waste Isolation Pilot Plant.

I. Mission Supporting Goals and Objectives - Rocky Flats (Continued)

The environmental restoration program is working to assess and clean up the 178 Individual Hazardous Substance Sites (IHSSs) identified at Rocky Flats and to conduct decommissioning activities in buildings where deactivation has been completed. The IHSSs were originally grouped into 16 operable units, three of which have been closed through No-Further-Action Records of Decision. The Industrial Area operable units have been consolidated to streamline the program, and further consolidation and streamlining is possible.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 112,372	$ 37,810	$ 60,260	$ +22,450	+59
Decontamination & Dismantlement	4,316	3,105	0	-3,105	-100
Long-term S&M	0	0	400	+400	+100
Landlord	0	17,079	2,780	-14,299	-84
Rocky Flats - Waste Operations	110,814	74,289	100,321	+26,032	+35
Rocky Flats - Site Stabilization	339,079	400,581	340,561	-60,020	-15
Total, Rocky Flats	$ 566,581	$ 532,864	$ 504,322	$ -28,542	-5

III. Performance Summary

FY 1995 Accomplishments (Environmental Restoration)

- Completed excavation of contaminated material from Ryan's trench, excavated four PCB hot spots and one radiologically contaminated hot spot from OU 1, and completed accelerated actions at Silos 1 and 2.
- Operated the treatment system for interim RA (IRA) at the 881 Hillside (OU 1) to treat contaminated ground water, completed CMS/FS and submitted Proposed Plan at OU 1.
- Continued assessment of potential soil/ground water contamination resulting from Present Landfill (OU 7) Operation; submitted draft IM/IRA decision document to collect and treat leachate.
- Operated the treatment system as part of the IRA for collection and treatment of contaminated water from surface seeps at the 903 Pad, Mound and East Trenches (OU 2); continued operation of the OU 2 subsurface IRA to remove volatile organic from soil; and continued assessment of soil, bedrock, and ground water contamination, to be completed in FY 1997.
- Finalized assessments and continue FSs for the Off-site Areas (OU 3) for soil, surface water, and sediment contamination primarily resulting from windblown radionuclides and spills to creeks.

III. Performance Summary - Rocky Flats (Continued)

FY 1995 Accomplishments (Environmental Restoration (Continued)

- Completed removal of contaminated sludges and waste from the Solar Ponds (OU 4); completed the stack and repack of pondcrete: continued RCRA compliance activities for storage of pondcrete and sludge resulting from removal and solidification of OU 4 sludge contaminated with mixed waste; continued operation of the OU 4 IRA Interceptor Trench System and treatment of captured ground water; and continue assessment of soil and ground water contamination resulting from the leakage of wastes from OU 4.
- Continued assessment of soil and ground water contamination and FSs at Woman Creek (OU 5) and Walnut Creek (OU 6) resulting from incinerator and landfill activities, retention ponds, ash pits, sludge dispersal, waste burial, and spray irrigation; submitted RI/RFI FS/CMS documents; completed Pond Water IM/IRA Decision Document; completed accelerated action to clean up filter socks.
- Continued assessment, using non-intrusive methods, of potential soil and ground water contamination at the Industrial Area; submitted Industrial Area IM/IRA decision document.
- Submitted RI/RFI report for West Spray Field (OU11) and completed No Further Action ROD, four years ahead of IAG schedule.
- Completed assessment at the Inside Building Closures (OU15), with a No Further Action ROD, three years ahead of IAG schedule.
- Continued operation and maintenance of field assessment equipment decontamination facilities.
- Continued design, construction, and operation of various units of the Waste Handling/Treatment Facilities for ER site-wide waste.
- Conducted D&D pilot projects in several buildings.
- Continued site-wide activities including data management, administrative record, public participation and environmental impact statement activities, treatability study, risk assessment, and geological studies to reduce site characterization costs; provided planning support for accelerated cleanup actions, completed the final geological characterization report.
- Shipped 343 drums of waste from OUs 1 and 2 to Envirocare.
- Completed the initiative to further safeguard drinking water supplies for communities in the vicinity of Rocky Flats (Option B-Off-site Water Management) and continued Option J (On-site Water Management) including activities to procure a Broomfield water treatment plant, installed a raw water pipeline, and construction of an offsite Woman Creek Reservoir and various on-site water management projects.

FY 1995 Accomplishments (Waste Operations)

- Completed and submitted the Proposed Site Treatment Plan on March 30, 1995, to the State of Colorado. Completed negotiation of the Mixed Low Level Waste Compliance Order with the State of Colorado.
- Disposed 480 yd3 of LLW at Hanford and NTS. Disposed nearly 400 yd3 of Land Disposal Restriction (LDR) compliant Mixed-LLW at a commercial disposal facility.
- Completed the Sewage Treatment Plant Phase I Sludge Drying System Upgrade and began construction for Phase II Upgrade.
- Commenced operations of the 25,000 square-foot Centralized Waste Storage Facility for newly generated Mixed-LLW in February 1995.
- Completed design and initiated construction of the New Sanitary landfill.

2109

III. Performance Summary - Rocky Flats (Continued)

FY 1995 Accomplishments (Waste Operations) (Continued)

- Completed NTS waste generator audit, which approved two new LLW streams for disposal. Treated approximately 10,000,000 gallons of waste water. Disposed of 105 M3 of backlog non-radioactive hazardous waste.

FY 1995 Accomplishments (Site Stabilization)

- Continued Productivity Improvement program for Surveillance and Maintenance Activities saving $6 million by reducing the number of surveillance through administrative changes and by streamlining maintenance activities.
- Savings of $5 million in Radioactivity Improvements were achieved by using more efficient technologies and improving process and procedural efficiencies to manage residues.
- Initiated 55-gallon residue drum venting program to vent a total of 2,645 drums; 2,045 drums vented in FY 1995.
- Initiated inorganic repackaging program to repackage a total of 700 inorganic residue drums by end of FY 2002. Repackaged 5 drums in FY 1995.
- Prepared 9 vaults and 38 gloveboxes for Resource Conservation and Recovery Act permitting and prepared unit closure list, standards and plans for 43 RCRA closure units as required by Judicial Order.
- Initiated Conceptual Design Development and National Environmental Policy Act analysis for residue stabilization program in preparation for line item construction project.
- Continued solid residue sampling, characterization, storage, and management activities.
- Completed environmental assessment and initiated thermal stabilization of plutonium materials for improved safe storage of material.
- Completed stabilization of 385, out of a total of approximately 1,025 bottles of plutonium solutions (approximately 3,800 liters).
- Completed the NEPA analysis for Phase II liquid stabilization activities, which include precipitation and solidification of approximately 26,000 liters of plutonium solutions in tanks and piping in Buildings 371 and 771 to support Phase II activities.
- Continued preparation of systems and equipment in Buildings 371 and 771 to support Phase II activities.
- Initiated building preparations in Building 886 to support draining and down-blending of highly enriched uranium solutions (2,700 liters in eight tanks). Program to be completed by December 1996.
- Stabilized 24 of approximately 63 kilograms of reactive plutonium oxide.
- Initiated repackaging of plutonium metal and oxide in direct contact with plastic, 137 of 222 items completed.
- Initiated sampling of plutonium in proximity to plastic for hazard assessment, 172 of 221 items sampled.
- Completed identification of Rocky Flats facilities that can be safely taken out-of-service.
- Continued payments to the State of Colorado for the Agreement in Principle.
- Improvements in cost reporting, management of computer systems and process improvement team enhancements to site operations have saved $3 million through productivity improvements.
- Completed the Environmental Assessment and initiated the consolidation of special nuclear material into Building 371.
- Initiated site-wide Environmental Impact Statement (EIS) preparation.

III. Performance Summary - Rocky Flats (Continued)

FY 1995 Accomplishments (Site Stabilization) Continued

- Management efficiencies in reducing procedural requirements and more effective and efficient training programs have achieved a savings of $3 million in productivity improvements in the site Landlord program.
- Met goals of the contract reform initiative by contracting an integrating contractor and subcontractors in place of the standard Management and Operating contractor at the site.
- Transferred plutonium pit surveillance program to the Los Alamos National Laboratory.
- Completed transfer of non-nuclear production to Kansas City.
- Transfer of facilities due to mission change from defense-related activities to Environmental Management activities.

FY 1996 Accomplishments (To Date and Planned) Environmental Restoration

- Continue operation of the OU 1 (881 Hillside) ground water treatment IM/IRA; submit final remedial action plan and final CAD/ROD.
- Continue operation of the OU 2 (903 Pad, Mound, and East trenches) surface water IM/IRA addressing treatment of contaminated water and subsurface IM/IRA soil vapor extraction pilot; submit draft CMS/FS.
- Complete and submit Draft and Final CMS/FS report for OU 3 and develop CAD/ROD.
- Continue RCRA closure activities for the Solar Ponds (OU 4) maintain Interceptor Trench System and place Building 910 evaporators in long-term shutdown; conduct permitting activities for the new process area; continue repacking nonconforming waste; conduct inspections and maintenance activities.
- Complete and submit final Phase I RFI/RI report for OU 5 (Woman Creek).
- Continue site-wide characterization efforts including characterization of background surficial soils, seep flow measurement, geophysical logging aquifer testing, 3-dimensional computer modelling of hydrogeology, and monitoring of new and existing monitoring wells at reduced levels; continue management of the Rocky Flats Environmental Restoration Database and analytical support services.
- Complete Phase I RFI/RI report for OU 6 (Walnut Creek) and the final CMS/FS report; complete implementation of the Pond Water IM/IRA.
- Complete OU 7 (Present Landfill) Leachate Collection IM/IRA Decision Document and initiate remedial design tasks.
- Conduct IM/IRA monitoring activities in the Industrial Area.
- Continue site-wide activities aimed at providing technical and operations support, including data management, administrative record, public participation, environmental impact statement activities, risk assessment, and geological studies.
- Conduct D&D projects in Building 889.
- Excavate and treat contaminated soil from Trenches T3 and T4.
- Excavate four PCB hot spots.

FY 1996 Accomplishments (Waste Operations)

- Continue support for waste handling, record maintenance, and quality assurance.
- Clean six tanks and fill with closed-cell foam; treat all material removed from the tanks.

23-254 96 - 67

2111

III. Performance Summary - Rocky Flats (Continued)

FY 1996 Accomplishments (Waste Operations) (Continued)

- Continue Base Program: including waste minimization; recharacterization of backlog waste; storage of transuranic/transuranic-mixed waste (TRU/TRU-MW), Low-Level Waste/Mixed-LLW, hazardous and nonregulated solid waste; onsite treatment of 155,000 gallons of organic waste, approximately 10,000,000 gallons of Mixed-LLW aqueous waste, and approximately 400 gallons of miscellaneous waste; and offsite disposal of 1100 cubic meters of LLW, 1,948 cubic meters of Mixed-LLW (saltcrete to Envirocare), and over 800 drums of hazardous waste (to facilities); maintain vital safety system equipment in Buildings 374 and 774; complete all LDR treatment compliance activities as described in the site treatment plan (STP); repack 300 non-compliant containers, vent and aspirate 400 TRU waste containers; perform headspace gas sampling characterization of 200 TRU/TRM drums; obtain waste water treatment unit (WWTU) exemption for Building 374.
- Initiate Title I Design for one Mixed-LLW treatment system (Miscellaneous Waste) required by the FFCAct Compliance Order.
- Continue design of upgrades to the Building 374 Liquid Waste Treatment Systems.
- Complete construction for Phase II of the Sewage Treatment Plant Upgrades.
- Complete construction and operational testing of New Sanitary Landfill and transfer facility over to landlord for operation.

FY 1996 Accomplishments (Site Stabilization)

- Perform 150,000 surveillances and 125,000 maintenance and operations support activities annually to safely store and handle over 13,040 kilograms of plutonium in 15 former weapon component manufacturing facilities.
- Complete Operational Readiness Review to allow for restart of tank draining activities stopped in FY 1994.
- Drain three tanks in Building 771 and begin solidification of solutions.
- Complete preparation of systems and equipment in Buildings 371 and 771 to support Phase II activities.
- Complete Building 886 preparations, draining, and down-blending of uranium solutions (2,700 liters in eight tanks). Ship solutions off-site for conversion to a solid.
- Accelerate the treatment of 1,056 cubic yards of residues in over 7,000 containers and external tank systems.
- Thermally stabilize the remaining 39 of 63 kilograms of reactive plutonium oxide in October 1996.
- Complete repackaging of remaining 85 of 221 items of plutonium metal and oxide indirect contact with plastic in November 1995.
- Complete sampling remaining 49 of 212 items of plutonium in proximity to plastic in September 1995.
- Initiate and complete repackaging of 1,602 items of plutonium metal and oxide in proximity to plastic in October 1996.
- Continue consolidation of special nuclear materials. Remove plutonium and oxide from Building 991, the first of six buildings in December 1995. Remove plutonium metal and oxide (category I and II Special Nuclear Material) from Building 779 (second of six buildings) by September 1996.
- Complete drum venting program, venting remaining 600 55-gallon residue drums by March 1996.
- Repackage an additional 100 of the 700 inorganic drums to be repackaged for a total of 105 drums.
- Initiate closure of 21 mixed residue container storage units and completed closure of 10 units.

2112

III. Performance Summary - Rocky Flats (Continued)

FY 1996 Accomplishments (Site Stabilization) (Continued)

- Complete NEPA analysis for residue stabilization program.
- Continue solid residue sampling, characterization, storage, and management activities.
- Provide training; conduct of operations improvements; radiological technician support; criticality safety support; and occurrence reporting support.
- Conduct an Environmental Monitoring Program (over 72,000 samples) annually including Air, Surface/Ground water monitoring, Soil Sampling and Chemical Tracking.
- Initiate design for the Criticality Alarms and Plant Annunciation System project to replace the 45 year old communication system which is the backbone to Rocky Flats' plant-wide fire, security, and communication systems. When completed this system will save $5.4 million per year.
- Provide utilities and services for the Rocky Flats Environmental Technology Site. Begin construction for the Underground Storage Tank project to replace 22 tanks to comply with Resource Conservation and Recovery Act requirements and avoid penalties of $5,000 per tank/day.
- Continue construction on the Plant Fire/Security System Replacement project to provide for replacement of existing security alarm and fire alarm systems.
- Complete transfer of plutonium pit surveillance program to the Los Alamos National Laboratory in September 1996.

FY 1997 Planned Accomplishments (Environmental Restoration)

• Submit final CMS/FS report for OU2 (903 Pad, Mound, and East Trenches); submit draft and final proposed plan; complete accelerated removal activities to reduce onsite contamination	$ 10,863
• Submit final proposed plan and CAD/ROD for OU3 (Off-site Areas)	301
• Excavate and treat soil and transfer to pond closure cell for OU4 (Solar Ponds); continue treatment of contaminated water; maintain storage pads; begin construction of RCRA closure cap to contain onsite contamination	11,050
• Operation and maintenance of the leachate collection system for OU7 (Present Landfill) will be continued; the Phase I IM/IRA construction will begin to reduce potential contaminant migration	5,888
• Intrusive field work will begin in the Industrial Area; accelerated actions will continue	3,987
• Technical direction and integration tasks will continue, including ground water monitoring, data management, health and safety support etc	10,016
• Program/project management tasks will continue, including public participation, administrative record, budget planning and management	9,280
• Proper handling, storage, and disposal of waste will be provided, including operation and maintenance of decontamination facilities and the sitewide treatment facility	9,209
• Conduct required long-term S&M activities to ensure continued protection of human health and the environment	400
• RCRA disposal cell design and permitting activities will be completed	2,446
Subtotal FY 1997, Rocky Flats Plant - Environmental Restoration	$63,440

2113

III. Performance Summary - Rocky Flats (Continued)

FY 1997 Planned Accomplishments (Waste Operations)	
• Continue support for Maintenance and Surveillance of Buildings 374, 774, and 664 to maintain vital safety systems and meet health and safety standards, per RCRA requirements and nuclear safety rules	5,576
• Continue support for base program and operations to maintain safe storage of backlog and newly generated LLW, Mixed-LLW, and TRU, TRU and TRU-mixed waste assay and characterization, and liquid and solid waste processing activities; additional support required for management of waste resulting from stabilization of Plutonium residues, as required by DNFSB Recommendation 94-1	71,096
• Continue support for hazardous waste treatment and disposal to meet RCRA requirements, and increase support for LLW and Mixed-LLW certification and disposal to alleviate storage overcrowding problems and provide areas for storage of newly generated waste resulting from stabilization of Plutonium residues	10,360
• Continue funding for mixed waste treatment and compliance as required by the FFC Act and Compliance Order on consent with the State of Colorado including design activities for two on-site treatment systems, treatability studies, and document preparation and updates	8,734
• Continue support for the upgrades and improvements to the site's wastewater treatment systems to maintain capability for treatment of low-level and mixed low level aqueous wastes (approximately 10M-gallons annually) and sludges to meet LDR/RCRA standards	4,275
• Continue support for the capital upgrade of the Sewage Treatment plan to meet OSHA requirements and NPDES discharge standards	280
Subtotal, FY 1997 Rocky Flats, Waste Operations	100,321

FY 1997 Planned Accomplishments (Site Stabilization)	
• Perform over 251,000 annual limiting condition of operation, Vital Safety System, inspections and other required surveillances. Perform over 590 annual preventive, corrective, and equipment calibration maintenance work orders to assure the safety envelopes in the storage facilities at Rocky Flats	32,900
• Maintain the nuclear material facilities at Rocky Flats by performing over 13,000 preventive corrective, equipment calibration and environmental corrective action work packages. Perform over 9,500 annual surveillances, and provide health and safety, technical support, nuclear safety support, ad utilities to buildings 371, 707, 886, and 991	61,617
• Perform analytical services and maintain the analytical facilities which sample over 70,000 items per year for Liquid Stabilization, Thermal Stabilization, Residue Elimination, Environmental Monitoring, Waste Management, Waste Characterization, Environmental Restoration, and Worker Protection Programs. Maintain the analytical and nonnuclear production facilities by performing surveillance and maintenance activities and providing building support functions	24,060
• Perform 1,240 security system maintenance activities; 461 security system surveillance and tests; 635 fire system maintenance work orders; 1,100 Life Safety Disaster Warning maintenance work orders; and execute 207 system tests in over 150 Rocky Flats buildings annually to assure safeguarding of special nuclear material	12,900

2114

III. Performance Summary - Rocky Flats (Continued)

FY 1997 Planned Accomplishments (Site Stabilization) (Continued)

- Continue preparation of Building 371 for long term storage of plutonium by completing Safety Analysis Report and continuing building modifications (July 1997); preparation of special nuclear material for shipment offsite, and consolidation of special nuclear material 36,725
- Install Plutonium Stabilization and Packaging Processing Plot type in Building 707
- Complete stabilization of approximately 18,000 liters of plutonium solutions in Buildings 371 and 771 and off-site conversion of highly enriched uranium solutions to a solid form for storage 32,800
- Repackage an additional 100 of the 700 inorganic drums to be repackaged by 2002 for a total of 205 drums; close out remaining 11 of 21 mixed residue closure units 25,500
- Begin design of facilities necessary to provide interim storage of plutonium in compliance with the Defense Nuclear Safety Board Recommendation 94-3. 12,900
- Complete Titles I, II, and III design review and construction for pyrochemical salt stabilization, part of line item project; start up pyrochemical salt stabilization to begin the processing of approximately 16,000 kilograms of plutonium bearing salt residues with a stabilization completion date of December 1998; complete Title I and II design review for the ash stabilization project, as part of line item project) and continue solid residue sampling, characterization, storage, and management activities 31,820
- Provide funding for the Agreement in Principal with the State of Colorado, which provides for independent monitoring of environment around the site. Support all environmental compliance activities as required by the Clean Air Act, Clean Water Act, National Environmental Policy Act and DOE Orders, such as air and water monitoring, discharge of 150 millon gallons of water, preparation of chemical management reports, environmental dose assessments, dam inspection, technical support for site environmental activities, and maintenance of environmental monitoring equipment 17,190
- Maintain the site infrastructure including the roads, the steam plant, the water system, provide support for occupational safety and health on the site including the radiological protection program, nuclear safety program, health and safety program 28,724
- Continue line-item projects, which will save costs by reducing the cost of maintaining the site's 40 year old infrastructure and modernize security, fire, and electrical systems throughout the site 23,425

Subtotal FY 1997, Rocky Flats (Site Stabilization) ..... $ 340,561

Total FY 1997 Rocky Flats $504,322

Explanation of Funding Changes FY 1996 to FY 1997:

- Funding reduction is based on expected agreement with regulators on shifting site priorities to emphasize materials stabilization activities.

Major Issues:

- None.

SAVANNAH RIVER

I. Mission Supporting Goals and Objectives

The Savannah River Site (SRS) has produced nuclear materials, primarily tritium and plutonium, in support of national defense projects for over 40 years. The site is located in south-central South Carolina and is bordered on the southeastern side by the Savannah River. The closest major population centers are Aiken, South Carolina and Augusta, Georgia. The ER Program is responsible for all aspects of assessment and remediation of facilities and sites that are no longer a part of active operations. Its responsibilities include 420 inactive waste sites and groundwater units located throughout the 310 square mile site. There are currently over 100 waste sites specifically identified to be remediated.

ER activities are grouped into nine Waste Area Groups (WAGs). WAG 1, A/M Area is composed of the main administrative area for SRS and an area previously used to produce fuel and target assemblies. WAG 2, Central Shops Area is primarily used as a storage and warehouse area for various support items. WAG 3, Reactor Units, encompasses the area occupied by the five production nuclear reactors. WAG 4, General Separations Area, includes the primary separations operations located in F- and H-Areas. These facilities separated and processed plutonium, tritium, and uranium from irradiated assemblies. WAG 5, TNX and D-Area, include the central powerhouse and heavy water facilities and the Savannah River Technology Center, which houses applied research and development programs. WAG 6, Miscellaneous Units, include acid/caustic basins, rubble pits and piles, coal pile runoff basins, and chemicals, metals, and pesticide sites located throughout the site. WAG 7, Site Evaluation Units, includes the evaluation, assessment, of potentially contaminated sites and the remediation of those sites requiring remediation. Also included are surveillance and maintenance of all remedial action sites (excluding decommissioning facilities). WAG 8, Program Management, provides the ER Program's program management-level support activities, including program and project controls, public involvement, regulatory compliance, quality assurance, cost-estimating, and operations support. WAG 9, Decontamination and Decommissioning, includes all decommissioning activities for the program.

Primary on-site contaminants include various nuclides (particularly plutonium, tritium, and uranium), volatile organic compounds, heavy metals, and solvents. Legal drivers for activities conducted at SRS include RCRA, CERCLA, and the site FFA (August, 1993) and various settlement agreements.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 87,870	$ 76,684	$ 92,971	$+16,287	+22
Decontamination & Dismantlement	20,519	17,453	8,973	-8480	-49
Long-term S&M	1,507	1,619	1,954	+335	+21
Compliance Oversight	273	4,062	3,559	-503	-13
Total, Savannah River	$ 110,169	$ 99,818	$ 107,457	$ +7,639	+8

III. Performance Summary - Savannah River (Continued)

FY 1995 Accomplishments

- Continued construction of ground water treatment unit at the Savannah River Laboratory (SRL) in the 3/700 Area.
- Completed installation and initiate operation of the vapor extraction units in vadose zone of the 3/700 Area.
- Continued operation of pump and treat system in 3/700 Area.
- Completed remediation design at 3 waste sites (low level radioactive waste disposal facility, F/H Seepage Basin ground water, and sanitary landfill); continued design for the TNX ground water remediation.
- Completed remediation development and planning at 4 waste sites (burial ground complex, sanitary landfill ground water, gunsite 113, and tank 16); continue at 11 waste sites (mixed waste management facility groundwater, old F-Area seepage basin, L-Area oil/chemical basin, D and F Area, Central Shops, and Burma Road burning rubble pits, Silverton Road, M Area West, Gunsite 720, and Grace Road).
- Performed groundwater characterization at the A/M Area and L Reactor sites.
- Completed 4 site characterizations (Miscellaneous Chemical basins/metal burn pit, 631-6C Central Shops burning rubble pits, A Area rubble pit, and A Area burning/rubble pit); perform characterizations at 6 additional sites (RWBG solvent tanks, F/H retention basin, CMP pits, Coal Pile runoff basins, C Area Burning/Rubble pits, and Bingham pump outage pits).
- Completed site evaluations on 24 waste sites.
- Continued limited D&D support and organization of D&D transition activities.
- Provided post-closure management on closed waste sites.

FY 1996 Accomplishments (To Date and Planned)

- Complete construction of ground water treatment unit at SRL in the 3/700 Area and begin groundwater remediation operations.
- Continue operations of the vapor extraction units at the vadose zone of the 3/700 Area.
- Continue ground water remediation operations at the 3/700 Area.
- Initiate remediation construction at 4 waste sites (Southern Sector, low level radioactive waste disposal facility, F/H Seepage Basin ground water, and Sanitary Landfill ground water).
- Complete remediation design at the Southern Sector and Sanitary Landfill ground water waste sites; continue remediation design at the Burial Ground Complex, the F/H Inactive Sewer Line, and the TNX ground water waste sites.
- Complete remediation development and planning at the Old F Area Seepage Basin and the Sanitary Landfill; perform additional remediation development and planning at the mixed waste management facility and F and H Tank Farm ground water waste sites.
- Complete 3 site characterizations (RWBG Solvent Tanks, 108-4R Overflow Basin, and R Reactor Seepage Basin); perform additional site characterization work at the K Reactor Seepage Basin and the F/H Retention Basin.
- Complete two interim actions and begin 1 interim action.
- Complete site evaluations on 24 waste sites.

2117

III. Performance Summary - Savannah River (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)
- Continue limited D&D support and organization of D&D transition activities.
- Provide post-closure management on closed waste sites.
- Provide for technical support of the ER program; including FFA reimbursement and AIP.

FY 1997 Planned Accomplishments	
• Continued remediation construction at the low level radioactive waste disposal facility (installation of final closure cap system)	$ 17,000
• Complete construction of ground water remediation system at the F/H Seepage Basin ground water waste site	11,500
• Place interim native soil cover over old radioactive waste burial ground	15,300
• Construction, procurement, and operation of 5 remediation systems (mixed waste management system, A/M Area soil vapor extraction units, TNX ground water Hybrid remediation system, in-situ bioremediation ground water treatment system, and the southern sector VOC removal)	16,993
• Characterization and technology selection for the mixed waste management facility ground water, reactor basins, the separations basins, the L Area oil and chemical basin and SRL Seepage Basin	26,004
• Continue current surveillance, maintenance and other activities at C, P and R reactors	8,973
• Regulatory required well sampling and analysis, reporting, and permit document submittals associated with the A/M Area ground water remediation project	4,500
• Continued ecological sampling, analyses, regulatory interface and document submittals associated with the F/H ground water treatment project	3,400
• Post-closure management activities and remediation management support	987
• Provide assessment program management	2,800
Total FY 1997, Savannah River	$ 107,457

Explanation of Funding Changes FY 1996 to FY 1997:
- Planned increase in remediation activities to: emphasize results in the field and fulfill commitments between DOE and regulators (+$16.3M).

Major Issues:
- None.

2118

HEADQUARTERS

I. Mission Supporting Goals and Objectives

Activities managed through Headquarters include funding for the Government's contribution to the Uranium Enrichment Decontamination and Decommissioning Fund. PRP payment for Maxey Flats and technical support are included.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 183,101	$ 370,228	$ 385,455	$ 15,227	+4
Total, Headquarters	$ 183,101	$ 370,228	$ 385,455	$ 15,227	+4

III. Performance Summary

FY 1995 Accomplishments

- Provided technical support to ER in the areas of document review, program integration, and other crosscutting areas.
- Provided support for Hazardous Waste Remedial Action Project and Remedial Action Program Information Center, and other data systems.
- Provided Government contribution to the Uranium Enrichment Decontamination and Decommissioning Fund.
- Provided for review and analysis of health assessments done by the Agency for Toxic Substances and Disease Registry.

2119

III. Performance Summary - Headquarters (Continued)

FY 1996 Accomplishments (To Date and Planned)
- Provide technical support to the Office of Environmental Restoration in the areas of document review, program integration, and other crosscutting areas.
- Continue support of program management plans and procedures, management support systems, strategic planning, performance systems, cost/schedule studies, and National Academy of Sciences and Corps of Engineers activities.
- Provide Government contribution to the Uranium Enrichment Decontamination and Decommissioning Fund.
- Provide funding for partial PRP payment for Maxey Flats.

FY 1997 Planned Accomplishments

• Provide Government contribution to the Uranium Enrichment Decontamination and Decommissioning Fund	$ 376,648
• Provide support funding for partial PRP payment to Maxey Flats	8,000
• Provide technical support to the Office of Environmental Restoration	807
Total FY 1997, Headquarters	$ 385,455

Explanation of Funding Changes FY 1996 to FY 1997:
- Increase in Government contribution to D&D fund. $+27.0M
- Reduction in support service contracts. $-11.0M

Major Issues:
- None.

1. Title and location of project:	Albuquerque Laboratory Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.2 2b. Operating Expense Funded

8. Project Description, Justification and Scope

Presented below are brief descriptions of the remedial action (assessment/remediation) projects at the sites indicated. Detailed scope, milestones, cost estimates, etc., for specific projects are contained in the Environmental Restoration (ER) Activity Data Sheets.

Los Alamos National Laboratory (LANL) ER Project:

The ER Project at LANL identifies and cleans up sites where hazardous and/or radioactive wastes were disposed of in the past. Approximately 2,000 potential release sites, aggregated into five field units, are currently scheduled for corrective measures investigation in the ER Remedial Actions Program under the Hazardous and Solid Waste Amendments (HSWA) Module of LANL's Resource Conservation and Recovery Act (RCRA) operating permit. ER operable units are located throughout the Laboratory and adjacent areas and are remediated on an as-needed basis. The type, area, and volume of contamination will be determined through the site assessment process.

The portion of the project scope to be accomplished with the requested FY 1997 appropriation includes the following:

- Field units will provide phase reports to the regulatory authority related to sampling activities.
- Additionally, ten assessments and two remedial actions will be completed at Field Unit 1; seven assessment and two remedial actions will be completed at Field Unit 2; one assessment and two interim actions will be completed at Field Unit 3; two assessment and two remedial actions will be completed at Field Unit 4; three assessment and two remedial actions will be completed at Field Unit 5.

LANL Decontamination and Dismantlement (D&D) Project:

The LANL D&D Program is to conduct remedial activities on surplus facilities at sites that have been transitioned to the Office of Environmental Management. The D&D program maintains accepted facilities in a safe configuration until restoration activities can begin. The facilities in the D&D program continue to deteriorate (especially the high explosives contaminated buildings at TA-16) emphasizing the need for restoration. The work will be done according to and in compliance with DOE Order 5820.2A. Delays in the accomplishment of this remediation will result in eventual higher costs in the form of need for extended surveillance and maintenance and escalated costs. Delays will also impact ER activities by increasing costs and preventing the start of site restoration activities. Assessment activities will continue throughout most of the duration of the project, so that planning activities will be ongoing for one or more buildings while remediation efforts are progressing for others.

2126

1. Title and location of project:	Albuquerque Laboratory Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.2 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

In 1997, the LANL D&D Program currently includes the assessment and decommissioning of the following facilities:

- Technical Area (TA) -21, DP West Site - This project encompasses buildings in which Pu-238, Pu-239, U-235 and U-238 were handled and the support buildings such as ventilation and filtration systems and storage buildings (16 buildings in total). The planning phase of this D&D project will include a plan for systematically decommissioning the DP-West Site. This type of strategy minimizes the need for bypassing or rerouting numerous utility systems. Some of the buildings are still in use but will be excessed in time to be included in the overall project. D&D activities are phased with the ER Program so that site remediation occurs after building removal.

- Complete TA-35 Phase Separator Pit Decommissioning. The project encompasses an underground structure of approximately 2,150 square feet that provided ventilation exhaust for the Los Alamos Molten Plutonium Reactor Facility and supporting structures, tanks, waste lines and ventilation ducting. The scope includes relocation of existing functioning ventilation equipment from support structure TA-35-7 and razing structure TA-35-7. The structure contains seven waste storage tanks and associated ducts and piping, as well as several thousand lead bricks (shielding) which are expected to be contaminated with radioactive and other hazardous materials.

This project will be completed in FY 1997 with the systems dismantlement of the structure, removal of underground lines and tanks, and waste disposal.

Sandia National Laboratories, New Mexico (SNL/NM) ER Program and D&D Program:

This project encompasses the assessment and remediation of inactive waste disposal and release sites at Albuquerque, Kauai Test Facility, Salton Sea Test Base, Edgewood (NM) Test Site, and other remote locations. As a result of six separate installation assessments and ongoing programs to identify potential waste disposal and release sites, 176 sites have been identified for further assessment and possible remediation. These sites have known or suspected releases of hazardous, radioactive or mixed waste. The ER Program, as administered by SNL/NM, is continuing its assessment activities and aggressively pursuing Voluntary Corrective Measures and No Further Actions. No remedial activities are anticipated at the multi-party sites and remote facilities.

2127

1. Title and location of project:	Albuquerque Laboratory Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.2 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The D&D subproject involves the Sandia Engineering Reactor. This effort requires quarterly inspections for a number of years, until the final disposition of the facility can be determined. The funding for this project which was included in the above numbers is as follows: Prior Years - $93, FY 1994 - $86, FY 1995 - $34, FY 1996 - $98, FY 1997 - $102, FY 1998 - $106, FY 1999 - $110 and FY00 - $114.

Most of the Albuquerque sites will be assessed under the requirements of the HSWA portion of the RCRA permit, as administered by the Environmental Protection Agency (EPA). The balance of the sites, most of which are at other Sandia-operated locations, will be assessed under Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) requirements. The Chemical Waste Landfill is regulated by the New Mexico Environment Department and is governed by an approved closure plan.

Sandia National Laboratories, California (SNL/CA) ER Program:

The highest priority cleanup project at SNL/CA is the fuel oil spill where 59,000 gallons of diesel fuel were released by accident from an underground transfer pipe in 1975. A bioremediation pilot study is being performed prior to full-scale bioremediation. In FY 1997, the bioremediation pilot study will incorporate the continued field placement of injection and extraction wells. Completion of these activities is necessary for regulatory approval prior to full remediation. The estimated volume of contaminated soil is approximately 87,500 cubic yards; an estimated six million gallons of water will be treated, recycled, or disposed of to publicly-owned treatment works.

The other potential major remediation site is the Navy Landfill site where the Navy deposited construction and other debris during the 1940's and 1950's. This landfill contains an estimated 90,000 cubic yards of soil, concrete, and other debris. In November 1994, the California Regional Water Quality Control Board (RWQCB) directed SNL to a prepare closure plan.

Ground water monitoring will continue and the ground water characterization report will be completed, remedial design will be developed, California Regional Water Quality Control Board approval of design will need to be obtained, National Environmental Policy Act documentation as directed will be completed, and remedial action will begin. SNL/CA will implement remedial design and complete closure of the Navy Landfill.

Remedial Action at SNL/CA is required by the California RWQCB Orders 88-142 and 89-184, and the California Solid Waste Water Quality Assessment Test, Tier IV. Restoration of the contaminated sites is also required under RCRA/CERCLA, other California codes, and DOE Orders. Failure to complete the remedial actions would result in degradation of the environment and possible health risk increase.

1. Title and location of project:	Albuquerque Laboratory Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.2 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Albuquerque Operations Office (DOE-AL), Environmental Restoration Division:

This task consists of technical support activities necessary to assist the DOE-AL ER Division in managing and coordinating the ER efforts at LANL, SNL/NM, SNL/CA, and the Inhalation Toxicology Research Institute (ITRI). The activities include: assist with planning, preparation and integration of Activity Data Sheets, assist with the preparation of the annual congressional budget for the ER Program; manage and implement ER Program assessment activities; perform quality assurance/quality control (QA/QC) for the ER Program activities at DOE-AL national laboratories; and assist with the development, integration, and analysis of a technical, cost, schedule, tracking and reporting system and progress tracking system.

Activity during FY 1997 will include assistance with preparation of the FY 1999 ER congressional budget, continuation of management and implementation of ER Program assessment activities, continuation of QA/QC activities, revalidation of baseline cost estimates, and assistance with maintenance of an automated project management system.

Also included in this activity is funding for the South Valley Superfund site. The South Valley Superfund site is the former location of a facility owned by the Atomic Energy Commission and operated by ACF Industries from 1951 to 1967. In 1967, the U.S. Air Force (USAF) took possession of the facility which was operated by General Electric (GE) to produce jet engines. GE purchased the facility in 1984 and is the current owner.

The ground water is approximately eight to ten feet below the surface at the South Valley site and in 1980 the San Jose 6, an Albuquerque municipal well, was closed due to solvent contamination in the vicinity of the well. Seven independent investigations were negotiated by EPA with various entities. All investigations found contamination in ground water under respective properties.

In September 1988, EPA signed Records of Decision (RODs) for cleanup of five operable units. DOE, USAF and GE were named in December 1988 as the potentially responsible parties (PRPs) for two operable units; the GE property (Plant 83) and the San Jose property. The ROD called for additional studies, well abandonment, and 30 years of monitoring.

The remedy at the facility consists of additional studies, vapor extraction of solvents from the unsaturated zone, and pumping and treatment of the contaminated ground water in the shallow and deep aquifers. The remedy at the contaminated municipal well calls for additional studies, well abandonment, and 30 years of monitoring. However, the monitoring program for the municipal well field will be combined with the Plant 83 monitoring so only one monitoring program will exist.

GE is currently implementing remedial actions, and the USAF and DOE pay approximately 91% of the total costs.

1. Title and location of project:	Albuquerque Laboratory Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.2 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

During FY 1997, for the South Valley Plant 83 operable unit, a pump and treat system for contamination in a shallow ground water aquifer will continue to operate. Construction for the deep zone treatment system began in FY 1995. Operation will begin in FY 1996.

If ongoing technical support activities are not funded as scheduled, the DOE-AL ER Program will risk not being in compliance with regulatory agreements which include RCRA 3008(h) Compliance Orders, HSWA Permits, and State of California RWQCB Order 88-142, and the New Mexico Water Quality Control Commission Regulations Discharge Plan. DOE would be subject to possible civil and criminal penalties applicable to these regulatory agreements. Lack of funding would also result in failure to prepare cost estimates and schedule baselines and to track and report costs and milestones.

South Valley:

The Department of Energy is a PRP in two RODs for this site. The RODs obligate DOE to pay for cleanup of the sites, but designate the current site owner as the party responsible for implementing the cleanup measures. DOE has no direct control over the remediation process. South Valley was placed on the EPAs National Priorities List in 1983 because of fear of Volatile Organic Compound (VOC) contamination of the city of Albuquerque municipal wells in South Valley.

Principle remaining contaminant problems are VOC contamination in a shallow aquifer that extends under a neighborhood, and in a deeper ground water aquifer used by the city for municipal water.

If funding can not be acquired, DOE will be in breach of its agreement with the current site owner and may be sued.

ITRI Environmental Restoration Program:

Assessment activities were performed to fully examine the extent of soil and/or ground water contamination resulting from past activities. The assessment included analysis of sewage lagoons, ground water, and soil to determine extent and level of contamination. Data was analyzed and a Remedial Action Plan was written which described alternatives to achieve regulatory compliance and protect public health. Remediation is being performed to clean up soil and/or ground water contamination to the extent necessary to meet regulatory compliance requirements. Activities include interim measures (soil venting), remedial design, removal of pond structures, closure of the lagoons, and health physics monitoring during remedial action.

Seven underground storage tanks and 2,000 linear feet of underground pipeline have been removed along with 3000 cubic yards of contaminated soil from the diesel oil release/spill site.

2130

1. Title and location of project:	Albuquerque Laboratory Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.2 2b. Operating Expense Funded

ITRI Environmental Restoration Program: (Continued)

There were five spill areas involved and only one area continues to be cleaned up using a soil venting system (Area 2). It is anticipated that all cleanup activities will be completed in FY 1996.

At the hot pond site, 80 drums of waste have already been shipped prior to remediation. With regards to the hot ponds, 580 lineal feet of steel frames and 400 cubic yards of hot pond concrete will be shipped as low specific activity waste to the Envirocare Site, Utah. An additional 56 cubic yards of "apron" concrete may be clean enough to ship to a landfill. During the remediation phase, and soil which is a "hot spot," estimated at 200 cubic yards of contaminated soil, has been packed to be shipped to Envirocare, Utah. Two small metal structures, approximately 12 feet by 15 feet and 15 feet by 30 feet, were removed, as well as approximately 1,224 lineal feet of fencing. These may be reused or disposed of depending on how clear they are.

In FY 1995, the remediation of the diesel oil spill was complete as well as the hot ponds. Remediation of nitrates in the ground water is being negotiated.

During the first quarter of FY 1996, remediation of the Sanitary Lagoons was completed. Transfer of lagoon sludge contaminated with 137-Cesium and 90 Strontium to Envirocare, Utah will be completed in FY 1996.

The purpose of this project is to treat/remediate soil and ground water contamination to the extent necessary to protect present and future public health and to meet both State and Federal regulatory compliance requirements. Regulatory drivers include 40 CFR 141.3-11,280.66-71; New Mexico Water Quality Act, 3-103A; New Mexico Underground Storage Tank Regulation #1205; DOE 5400.1,.5.3,.5c(2), and 5820.2A-4a,b.

The scope of the project activities includes assessment planning, field assessment, interim measures, remedial planning/design, site remediation, and final reporting. Initial assessment activity began in FY 1991 and remedial activity will be completed by FY 1996. Delays in the project could result in additional migration of pollutants to soil/ground water, State Notice of Violation, or potential $5,000 per day State penalty.

2131

1. Title and location of project:	Albuquerque Laboratory Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.2 2b. Operating Expense Funded

9. Method of Performance

LANL ER: The ER Remedial Action Program will be implemented using Laboratory staff and a mixture of subcontractors (e.g., analytical chemistry, field investigation, and architectural engineering).

LANL D&D: LANL D&D staff will provide project management and oversight. Laboratory staff will provide, on an "as needed basis", health, safety, and environmental services (e.g., health physics monitoring, industrial hygiene, safety, criticality, and engineering). Subcontractor will provide project management, information services, analytical chemistry, and field investigations. LANL's maintenance support contractor will assist on field assessment activities and perform actual remedial work under a cost-plus fixed fee contract on an "as needed basis" unless scope of work is outside its experience and warrants competitive bidding.

SNL/NM: Two general types of service contracts are used in this program, the task order and on-site contracts. Task order contracts are awarded to companies which respond with professional services when tasks are assigned. On-site contracts are awarded to companies which provide personnel to work on-site, for a specified period. Additionally, contracts for a specific service or item may be written.

SNL/CA: Contracts for this program are usually fixed-price or time and materials.

Environmental Restoration Division: The Project Office will utilize the Technical Support Office from LANL, GEOTECH, and other contractor support as necessary for ER Program support. The South Valley activities will be performed by GE with DOE (as a PRP) reimbursing 43.2% of the cost.

ITRI: ITRI will be subcontracting individual work packages for assessment (such as tank removals and monitoring well installations) and remediation efforts. The program management portion of the work is also subcontracted.

10. Schedule of Project Funding and Other Related Funding Requirements

a. Subproject Summary Level	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total
1. Remedial Action	$ 361,024	$ 109,444	$ 85,503	$ 61,347	$ 213,178	$ 830,496

Total	$ 379,654	$ 118,074	$ 91,303	$ 66,949	$ 249,366	$ 905,346

2132

1. Title and location of project:	Albuquerque Laboratory Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.2 2b. Operating Expense Funded

11. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

8. Project Description, Justification and Scope

Kansas City Plant (KCP) Environmental Restoration Program:

Forty-one inactive waste sites are identified at the KCP installation, twenty-seven of which are subject to ER action. The primary contaminants at the KCP are polychlorinated biphenyls and chlorinated solvents. The most immediate risk at the KCP is from three plumes of ground water contaminated with low levels of chlorinated solvents. Ground water from these plumes is currently being pumped to a treatment system. Without this treatment, contaminated ground water would migrate offsite into the Blue River, which is adjacent to the plant. Assessment and remediation activities at the KCP are required to comply with a RCRA 3008 (h) Order of Consent, signed June 23, 1989. Assessment activities include the performance of RCRA Facility Investigations to confirm the presence or absence of potential contamination sources and to evaluate environmental pathways at SWMUs. Corrective Measures Studies (CMSs) are performed to assess alternative technologies to eliminate or control the contamination. Remediation activities are performed to implement the remedial measures selected as a result of the CMSs; remedial design costs are also included in this activity. There are currently ten different projects in various phases of assessment or remediation at the KCP.

The following activities are scheduled to be performed in FY 1997:

- Remediation will continue on the Trichloroethylene Still Area, Outfall 001/Northeast Area, Department 26, Department 27 Inside, and Ground Water Treatment and Monitoring projects.
- Interim measures activities will continue on the Plating Building and Manpower Utilization Report System projects.

In addition, program management and National Environmental Policy Act activities will continue. These activities include regulatory deliverable coordination and support, baseline management, budgeting and funds management, audit/validation/review support, and performance reporting.

Pantex Plant Environmental Restoration Program:

Remedial Action Subprojects:

Assessment and remediation is presently being conducted under the Plant's RCRA permit. In 1994, Pantex was added to EPA's National Priorities List, so future activities will be subject to requirements of CERCLA. The process of defining and negotiating the transition between RCRA and CERCLA is underway.

ER program objectives include having 95% of the 144 SWMUs closed by FY 1997 and to have the remaining SWMUs in remediation by FY 2000. Remediation of sites at Pantex Plant by the year 2000 meets the EM program Small Sites Initiative as well as the State of Texas "Clean Texas 2000" initiative.

2136

1. Title and location of project:	Albuquerque Production Environmental Restoration Project Various Locations	2a. Project No. D/ND-1.4.3 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Albuquerque Operations Office, Environmental Restoration Division:

This task consists of program support activities necessary to assist the Albuquerque Operations Office ER Division in managing and coordinating the ER effort at the KCP, and Pantex Plant. The activities included are: assist with planning, preparation and integration of ER Program ADSs, and other planning documents; assist with preparation of the annual congressional budget for the ER Program; manage and implement ER Program assessment activities; perform Quality Assurance/Quality Control (QA/QC) for ER Program activities at DOE-AL production plants; and, assist with the development, integration, and analysis of a technical, cost, schedule, tracking and reporting system, and progress tracking system.

9. Method of Performance

Activities during FY 1997 will include development of the FY 1999 ADSs, assistance with the preparation of the FY 1999 ER budget, continuation of management and implementation of ER Program assessment activities, continuation of QA/QC activities, revalidation of baseline cost estimates, and assistance with maintenance of automated project management system. Funding for Agreements-in-Principle (AIPs) with the States of Texas, and Missouri is also included, as is funding for the innovative treatment remediation demonstration project.

If support activities are not funded as scheduled, the DOE-AL ER Program will risk not being in compliance with regulatory agreements which include a CERCLA 120 Federal Facility Agreement, RCRA 3008(h) Compliance Orders, and HSWA Permits. DOE would be subject to possible civil and criminal penalties applicable to these regulatory agreements. Lack of funding will also result in failure to prepare ADSs, cost estimates, and schedule baselines, and to track and report costs and milestones. Lack of funding for AIPs with States will violate Secretarial commitment and result in damage to relationships developed between DOE and the States.

KCP: Design and inspection will be performed under KCP negotiated Architect-Engineer contracts. Construction will be by fixed-price contract awarded after competitive proposals and administered by the KCP.

Pantex Plant: The remediation activities will be performed by an outside construction contractor operating under a fixed-price, lump-sum contract and will be administered by the U.S. Army Corps of Engineers (operating under an Interagency Agreement with the Department of Energy, Amarillo Area Office). Remediation activities are also performed by the M&O (Mason & Hanger-Silas Mason Co., Inc.) and its subcontractor (Battelle Memorial Institute - Pantex).

Environmental Restoration Division: The project will utilize the Technical Support Office from the Los Alamos National Laboratory and other subcontractor support as necessary for Program Support.

1.	Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

8. Project Description, Justification and Scope

There are eight activities described in this section for environmental restoration: Ames Laboratory, Chicago-Prime, Brookhaven National Laboratory (BNL), Argonne National Laboratory-West (ANL-W), ANL-East (ANL-E), Princeton Plasma Physics Laboratory (PPPL), Program Management, and Agreements-in-Principle (AIPs). Each activity is described as follows:

A. AMES LABORATORY

Ames conducts research in materials and chemical sciences, and related research in material reliability and nondestructive evaluation. The major environmental concern is remediation of an inactive chemical waste disposal site.

UST Contamination Assessment/Remediation (ADS 5201):
In compliance with Iowa State statutes, Code of Iowa 455b.411.468, and the Iowa Administrative Code, Division 567, Chapter 135, "Technical Standards and Corrective Action Requirements for Owners and Operators of Underground Storage Tanks" the UST will remain in place. Annual ground water monitoring will continue for several years.

Ames Chemical Disposal Site Remedial Investigation/Feasibility Study (RI/FS) and Remedial Design/Remedial Action (RD/RA) (ADS 5202):
The purpose of the chemical disposal site project is to assess and remediate the contamination that remains at the site near the Iowa State University Applied Sciences Complex. The chemical disposal site was remediated during FY 1994 and FY 1995 when approximately 1,000 cubic meters of contents and adjacent contaminated soils from the nine pits were disposed offsite. Monitoring wells were installed around the site and a ground water investigation will conclude in FY 1997. These activities are being done to fulfill the requirements of the Iowa Administrative Code Section 567, Chapter 133, and the Code of Iowa 455B.411.468.

Program Management (ADS 5203):
The program management encompasses the management of Environmental Restoration projects and associated support activities. Program management includes the development of a program to coordinate responsibilities and interrelationships of the laboratory organizational units, gaining approval for the program and implementing it. During FY 1997, the Ames staff will continue program administration tasks including preparation of current year work plans, baselines, and related project management and control documentation.

2141

1. Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

B. CHICAGO-PRIME

A number of activities, that are not laboratory specific, are grouped under this category. Each is discussed in detail as follows:

Palos Forest Preserve Site A/Plot M:
Palos Forest Preserve Site A/Plot M is the site of the former CP-2 Reactor and the University of Chicago Metallurgical Laboratory, which was operated as part of the Manhattan Engineer District project between 1943 and 1954. Continued radiological and hazardous surveillance and monitoring is required at the site in order to comply with DOE Orders 5400.5, "Radiation Protection of the Public and the Environment," and 5400.4, "Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Requirements." Future environmental restoration activities include completion of the characterization of the site, and the remediation of suspect areas.

The characterization and interim action activities are/were being performed to reduce risk to the public, which has access to public park facilities in the forest preserve. These activities are to comply with DOE Orders 5400.4 and 5400.5; CERCLA Section 120; Resource Conservation and Recovery Act (RCRA) (40 CFR 262, 264, and 265); and Illinois regulations for borehole closures and installation of monitoring wells.

Site A/Plot M S&M and Remediation (ADS 8204 and 8207):
During FY 1995, two interim actions were completed. Several USTs were removed and approximately 20 existing monitoring wells/boreholes were plugged and abandoned. Surface hazards will be eliminated during FY 1997. Assessment activities will be completed in FY 1995 and the final remediation is expected to include a small amount of "hot spot" soil removal and continued monitoring. S&M activities will continue in and around the site.

2142

1. Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Hallam and Piqua S&M:
The Hallam and Piqua Nuclear Power Facilities were built and operated as a demonstration project by the Atomic Energy Commission (AEC). The Hallam facility, located in Nebraska, now contains entombed components from a thermal sodium-cooled graphite-moderated nuclear reactor. The Piqua Facility, located in Ohio, contains entombed nuclear reactor components from a 45.5 megawatt organically cooled and moderated reactor.

S&M activities at both of these facilities are required in order to comply with DOE Order 5820.2A and are required by a lease agreement with the Nebraska Department of Health (Hallam) or a contract between the AEC and the City of Piqua, and are performed to assure that no radioactivity is being released. Assessment reports detailing the sampling and analysis are published annually.

Hallam S&M (ADS 8202):
Routine environmental radiological S&M is conducted to ensure containment. During FY 1997, monitoring of static ground water levels as well as sampling and analysis of wells will occur; radiological survey of entombed reactor will be done; and the annual site environmental report will be prepared.

Piqua S&M (ADS 8203):
The technical scope includes ongoing evaluations, assessments, and S&M activities. During FY 1997, the annual evaluation and assessment will occur as well as required followup to any FY 1995 activities.

C. BROOKHAVEN NATIONAL LABORATORY

BNL is a multi-purpose research and development laboratory that directs scientific and technical efforts including low- and high-level energy physics, life sciences, and nuclear medicine research. The major environmental concern at BNL is characterization and remediation of soils and of the underlying sole-source aquifer. The work is being done under the requirements of the interagency agreement (IAG) (which became effective during May 1992) among the Environmental Protection Agency (EPA), the State of New York, and the Department of Energy and integrates RCRA and CERCLA cleanup requirements. Each of the five operable units (OUs) will undergo project sloping, RI/FS, Record of Decision (ROD), remedial design, remedial action, and monitoring.

Sitewide Activities (ADS 2302):
The scope includes sitewide activities necessary to implement remedial actions that apply to multiple OUs. Ground water model development, as well as modeling and analysis and monitoring will continue.

1. Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

OU I (ADS 2303):
OU I encompasses the southeastern quarter of BNL and consists of several areas of concern. The ROD will be completed. Capping of the former landfill will continue in FY 1997; design of the groundwater interim action will be completed and operation will begin.

OU II (ADS 2304):
OU II is located in the north central portion of BNL. Assessment at the Brookhaven Graphite Research Reactor (BGRR), Paint Shop, and Old Firehouse and will continue in FY 1997. The FS will be completed. The BGRR D&D subproject is expected to be initiated beyond FY 2000.

OU III (ADS 2305):
OU III encompasses most of BNL including sixteen areas of concern. The RI report will be completed. The draft ROD will be initiated.

OU IV (ADS 2306):
OU IV is located in the east central portion of BNL and includes two complete areas of concern and two partial areas. The RD/RA work plan will be completed at the Central Steam Facility in FY 1996 and RD/RA will continue in FY 1997. Construction of the designed remedy and startup will begin.

OU V (ADS 2307):
OU V encompasses the northeastern portion of BNL. The RI/FS report will be completed.

Program Management:
Program management support activities provide general programmatic supervision and support for the planning, assessment, remediation, and closure of all OUs and RAs as well as sitewide activities at BNL. All actions will comply with all prescribed legal, health, and public safety parameters.

Program Management (ADS 2300):
The activities will include preparation and weekly and monthly reports, development of revised baselines and ADSs, prepare current year work plans, development of quality assurance plans and manuals, and other requirements that are necessary to support the program.

D. ARGONNE NATIONAL LABORATORY-WEST

Waste Area Group 9 (WAG 9) is basically the administrative boundary of ANL-W within the Idaho National Engineering Laboratory (INEL).

2144

1. Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Remedial Action - WAG 9 Assessment (ADS 1702):
The work at ANL-W includes four OUs which are composed of solid waste management units (SWMUs). During FY 1997 RI/FS field work will be completed, the proposed plan and the ROD will be developed. Also during FY 1997 an Abandoned Industrial Waste System will be removed and one monitoring well will be installed. The purpose of the activities is to comply with the Federal Facility Agreement/Consent Order (FFA/CO) agreement among DOE, the State of Idaho, and EPA Region X, which was signed on December 9, 1991, to meet location, contaminant, and action-specific requirements imposed by statutes and regulations, and to implement guidance and agreements. Activities follow a phased approach with public involvement activities occurring throughout the process.

Program Management (ADS 1700):
The program management activities at ANL-W encompass the technical and financial support necessary to provide assistance to INEL FFA/CO WAG 9 and other environmental activities.

During FY 1997, evaluation of regulatory corrective actions for projects and activities under regulations will continue. In addition, program support for updating the WAG 9 baseline and current year baseline will be provided.

E. ARGONNE NATIONAL LABORATORY-EAST

ANL-E conducts research in a broad program of basic energy and related sciences and serves as an important engineering center for the study of nuclear and non-nuclear energy sources. The purpose of the Remedial Action Program at ANL-E is to investigate and remediate contaminated sites and facilities in compliance with DOE orders and Federal, State, and local regulation. The FY 1997 environmental activities will comply with the requirements of the anticipated RCRA Part B permit, which is scheduled to be issued by FY 1996 and will require that investigation and cleanup activities occur on schedule. Remedial Action activities will address the SWMUs, which require attention as a condition of the granting of the permit.

Remedial Support Activities (ADS 1432):
The sitewide hydrogeological baseline study will provide baseline data for characterization and remediation activities required under RCRA. The SWMUs assessment will characterize inactive SWMUs located across the facility. During FY 1996 closure of all abandoned wells will be completed. During FY 1997, the RCRA FI (RFI) work plan will be completed.

Solid Waste Storage/Disposal (ADS 1433):
The 800 Area landfill, the lime sludge removal, and the building 810 solvent disposal area are the sites as defined by RCRA. The projects focus on the characterization and remediation of the environment around these areas. Two interim actions were completed in FY 1994 and FY 1995 and RFI field work began in FY 1995. During FY 1996, the 800 Area RFI field work will be completed. In FY 1997, the interim measures assessment will also be completed and designs of remedial actions will be started as appropriate.

1. Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Mixed Waste Storage/Disposal Facilities (ADS 1434): The scope provides for the assessment, characterization, and remediation of 13 SWMUs, closure of two RCRA permitted hazardous waste treatment units, and radiological decontamination of inactive radioactive waste storage structures in the 317/319/ENE area. Two interim actions were completed in FY 1995; two interim actions will be completed in FY 1996 including an interim action to place a barrier to off-site contaminated ground water movement. In FY 1997, radiological survey of deep and north vaults will be completed and cleanup will begin.

Treatment Sites (ADS 1435):
The scope is to characterize former wastewater treatment sites, including the East Area, 570 Holding Pond, Sawmill Creek, 100 Area, and Outfall Areas. During FY 1997, no work will be performed.

D&D:
The scope of the activities at ANL-E includes all the related activities to support the D&D of previously used reactor facilities at the laboratory. These activities which are required in order to comply with DOE Order 5820.A and that reduce or prevent radioactive releases to the environment, consist of the remediation of all reactor facilities including the disassembly, packaging, and disposal of all materials that may have become activated or contaminated during facility operation, and decontamination of all facility surfaces with contamination levels in excess of allowable limits. Some of the facilities are being cleaned up at this time and others are scheduled for the planning and outyears.

Reactor Facilities D&D Projects (ADS 1437):
The scope of the work provides for the D&D of several idle reactor facilities at ANL-E. The work includes the disassembly, segregation, packaging, storage and disposal of contaminated materials, and the decontamination of contaminated surfaces. During FY 1996 and FY 1997, the CP-5 Reactor complex removal will continue and the Janus Reactor decontamination/dismantlement will be completed.

Support Facilities D&D Projects (ADS 1438):
The activities are for the D&D of Building 200 M-Wing Hot Cells, Building 212 Pu Glovebox Facility, Building 310 Surplus Retention Tank, Building 579 Waste Ion Exchange Facility, 60" Cyclotron, and Building 301 Hot Cells. During FY 1996, the Building 212 Glove Boxes and the Building 200 activities for the M-Wing Hot Cells will be completed and the buildings transferred to Landlord. In FY 1997, the Building 300 USTs removal will begin.

2146

1. Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Program Management (ADS 1439):
The program management activities include all those activities required to provide program level management tools, plans, documents, and support necessary to successfully complete the execution of the environmental restoration projects.

This activity includes development and operation of a project management control system; preparation of sitewide documents; coordinating development of project and program plans; and preparing for reviews and audits. The FY 1997 work will include preparation of current year work plans, budget documents, baselines, and project tracking and reporting.

F. PRINCETON PLASMA PHYSICS LABORATORY

PPPL conducts magnetic confinement plasma physics research and investigates the practical application of fusion power as an energy source. The primary environmental concern is the remedial investigation and assessment of ground water beneath the site. If appropriate, remedial actions may be necessary as a result of the investigation. This work is required under the Memorandum of Understanding between Princeton University and the New Jersey Department of Environmental Protection.

Ground Water Characterization/Remediation (ADS 3201):
The remedial actions at PPPL are to assess the site known as site C/D, evaluate the alternative remedial actions based on that assessment, determine the best alternative, and implement the alternative to ensure protection of human health and the environment. The purpose of the remediation activities is to comply with the New Jersey Spill and Control and Compensation Act, the states's interim cleanup standards for contaminated sites (USAC 7:26D), and any risk-based levels developed during the remedial investigation phase of the project. In FY 1997, the remedial action assessment report will be finalized and the ROD submitted to the regulators.

Soil Remediation (ADS 8208)
The remediation at PPL involves compensating Princeton University for remediation work at this site (known as site A/B). The terms of this compensation are in negotiation between DOE and Princeton University at this site where DOE conducted research in the past.

Program Management Support (ADS 3200):
This work includes providing administrative, budgeting, and scheduling services. Program management also includes strategic planning, project planning, project control and reporting, and DOE technical support. During FY 1997, the specific work will include preparation of Activity Data Sheets; preparation of the priority system; ongoing baseline activities; monthly reporting requirements; and preparation of current year work plan.

2147

1. Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

G. PROGRAM MANAGEMENT

Chicago Program Management Support (ADS 8200):
The scope of this activity includes development, implementation, and maintenance of the integrated CH program management system. The program/project management activities include the design and documentation of the project control system, the quality assurance program, the records management system, and support to the planning function as well as support for the preparation of planning documents, activity data sheets, records management, baseline development, quality assurance, and performance reporting. During FY 1997 all the activities identified above will be supported as necessary.

H. AGREEMENTS IN PRINCIPLE/ IAG (ADS 8201)

AIP provides oversight support funding to New York State for CERCLA oversight and sampling under CERCLA 120(f), at BNL. Specific activities to be performed at BNL are stipulated in the signed FFA and State grant. The regulatory drivers are CERCLA 120 (f), Federal Facilities - State and Local Participation, and FFA/IAG Parts XXIII and XXII.

9. Method of Performance

Ames Laboratory: The contract mechanisms for the activities at Ames are as follows: The UST monitoring activities and the long-term ground water monitoring program at the Chemical Disposal Site will be via subcontract to Ames; the characterization at the chemical disposal site are via subcontract by the Chicago Operations Office. Currently, all the contracts are planned to be cost-plus.

Chicago Prime:

Palos Forest Preserve Site A/Plot M: The prime contract between DOE and the contractor was a modification to the Formerly Utilized Sites Remedial Action Project contract between Oak Ridge and Bechtel and was terminated in FY 1995. Any needed remediation will be subcontracted by the Chicago Operations Office. Monitoring activities continue via subcontract to ANL-E.

Hallam and Piqua: Monitoring activities at the Hallam facility will be performed by Nebraska Department of Health. Monitoring activities at the Piqua facility will be performed by a CH laboratory contractor.

2148

1.	Title and location of project:	Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois	2a. Project No. D/ND-1.4.17 2b. Operating Expense Funded

9. Method of Performance (continued)

BNL: The prime responsibilities and contracting strategy for major activities associated with the projects are as follows:

- BNLs Office of Environmental Restoration will be responsible for (1) planning, estimating, and budget preparation; (2) scope of work for RI/FS work plans; (3) management and oversight; (4) proposed remedial action plan; (5) ROD; and (6) analysis of data generated during post-closure monitoring.
- Consulting contractor will be responsible for (1) RI/FS and Engineering Evaluation/Cost Analysis; and (2) remedial design. Competitively bid fixed-price contracts will be awarded for remedial and removal actions.
- Management and operating functions may be assigned to the BNL operations group depending on the remedy. Post-closure monitoring is likely to be managed as fixed-price competitive procurement.

ANL-W: ANL-W design services will be performed by an Architect/Engineering (A/E) firm under a negotiated, fixed-price contract. The construction will be performed by a construction contractor who will be selected by competitive bids using drawings and specifications to obtain a single, fixed-price construction contract. ANL-W will administer the design and construction contracts, and will provide engineering support services and construction inspection.

ANL-E: At ANL-E, remedial action planning will be done by ANL-E personnel with assistance from outside engineering firms. Field activities on all large projects will be contracted to A/E firms. Some small scale preliminary field investigations will be completed by ANL-E personnel. Engineering design and inspection will be performed by ANL-E engineering personnel aided by A/E firms. Project management functions will be provided by ANL-E staff, including oversight of all design and field activities.

PPPL: To the extent feasible, construction and procurement will be accomplished by a fixed-price contract, which will be awarded on the basis of competitive bids.

CH Program Management and Support Activities: CH program management technical support services will continue to be provided by the technical support contractor, mainly through a cost-plus-fixed-fee contract.

AIP Oversight: The funding for the oversight activities is accomplished through a grant from the DOE to the regulatory agencies.

2149

1. Title and location of project: Chicago (CH) Laboratories Environmental Restoration Project Argonne, Illinois

2a. Project No. D/ND-1.4.17

2b. Operating Expense Funded

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 85,857	$ 20,000	$ 25,152	$ 28,386	$ 99,860	$ 259,255
2. Decontamination & Dismantlement	42,582	9,649	5,283	5,242	24,188	86,944

2151

1. Title and location of project:	INEL Environmental Restoration Project	2a. Project No. D-1.4.9
	Idaho Falls, Idaho	2b. Operating Expense Funded

8. Project Description, Justification and Scope

The purpose of the INEL Environmental Restoration Program (ERP) is to identify, assess, and remediate designated areas so that the INEL may be delisted from the Environmental Protection Agency (EPA) National Priorities List (NPL), and to decontaminate and dismantle (D&D) certain surplus facilities. The ERP also provides program management support to all management activities by the contractor and implements the requirements of the Federal Facility Agreement/Consent Order (FFA/CO).

Remedial Actions (RAs):
RAs consist of an assessment phase and a remedial phase, and are conducted in accordance with the provisions of the INEL FFA/CO, signed by EPA, the State of Idaho and DOE, in December 1991. During the assessment phase, all potential release sites will be characterized to determine the type and extent of any contamination. Depending on the assessed risk and urgency, interim actions may be taken to mitigate any risks to human health and the environment. Information gathered during the assessment phase will be used to develop remediation methods to be used during the remedial phase of the ERP. RAs are managed as Waste Area Groups (WAGs) defined in the FFA/CO and include WAGs 1-7 and 10, which are further divided into operable units (OUs). WAGs 8 and 9 are managed by other DOE organizations. A brief description of each of the WAGs follows:

WAG 1, Test Area North (TAN):
WAG 1 is divided into 10 OUs, which include underground storage tanks, pits, ponds, ditches, injection wells, soil sites, a sewage treatment plant, and a railroad turntable. Hazardous, radioactive, and mixed wastes exist at WAG 1. Possible contaminants include asbestos, hazardous containments (metals and organics), petroleum products, acids and bases, radioactive rubble and metal, laboratory bottles, and sanitary wastes.

Ground water contamination (trichloroethylene), in excess of drinking water standards, was initially identified in 1987 at the Test Area North (TAN) Technical Support Facility (TSF), and confirmed to have spread further into the Snake River Aquifer in 1989 and 1990. This contamination was a primary factor in EPA's listing of the INEL on the NPL in November 1989. In all, there are 94 potential release sites in WAG 1. The project includes installation and operation of the Ground Water Treatment System, designed as an interim action to reduce sources of ground water contamination and contain the plume of contamination at the TAN/TSF Injection Well site. The Record of Decision (ROD) for the Ground Water Remedial Action/Feasibility State, was submitted in FY 1995 and RA, which will include continuation of the treatment begun under the interim action, will commence in FY96. Work will also continue on the WAG comprehensive Remedial Investigation/Feasibility Study (RI/FS) and TSF VTank removal action.

2152

1. Title and location of project:	INEL Environmental Restoration Project	2a. Project No. D-1.4.9
	Idaho Falls, Idaho	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

WAG 2, Test Reactor Area (TRA):
WAG 2 is divided into 13 OUs. Possible contaminants include petroleum products; chemicals, including acids and polychlorinated biphenyls (PCBs); hot and warm radioactive wastes; and heavy metals. The comprehensive RI/FS is required to evaluate sites not previously addressed in the FFA/CO process and sites determined to require further evaluation based on decisions by the regulators. The project includes the completion of a major portion of the WAG 2 comprehensive RI/FS implementation phase and monitoring required by the RODs for the TRA Perched Water and the Interim Action ROD for the Warm Waste Pond. The WAG 2 comprehensive RI/FS is intended to address risks at any sites not addressed in previous investigations and the cumulative risk posed by all WAG 2 sites. The WAG 2 RI/FS will be in the implementation phase in FY 1996 which includes preparation of the draft RI/FS report, a primary FFA/CO document. Continue O&M operations at Warm Waste Pond.

WAG 3, Idaho Chemical Processing Plant (ICPP):
WAG 3 is divided into 13 OUs. Contamination include substances such as organic (including PCBs), asbestos, radionuclides, metals, corrosives, petroleum wastes, and mixed wastes. The primary area of concern is the high-level liquid waste tank farm area that has released high-level radioactive mixed waste and other contaminants (mentioned in Item #8) into the soil beneath the site. The current scope of the project includes Track 1 and Track 2 assessments and a comprehensive RI/FS to determine the level of risk associated with existing hazards. The comprehensive RI/FS will be implemented during FY96 and FY97 with final draft RI/FS ROD submitted in FY97. The extent of remediation activities will depend on the outcome of these assessment activities. Site surveillance and monitoring work will be performed to verify site integrity and contaminant migration rates.

WAG 4, Central Facilities Area (CFA):
This WAG is divided into 13 OUs. Known or potential contaminants include chemicals, solvents, PCBs, asbestos, unexploded ordnance, heavy metals, and construction debris.

Services for the entire INEL are headquartered at the CFA. Risks to be considered are primarily those due to ingestion or inhalation of surface contaminants at various sites. A "No Action" Final ROD was signed in January 1993 for the CFA Motor Pool Pond, which was an unlined evaporation pond formerly used to contain liquid wastes from parking areas for INEL fleet vehicle servicing operations.

Field sampling will be conducted and Track 2 assessments completed for two areas suspected of being contaminated with lead and for the CFA Sewage Plant, which contains low levels of radioactive contamination, primarily from laundry operations. Risk evaluations will be performed for these sites, and determinations made as to the next appropriate steps to take (i.e., no action, interim action, or RI/FS). Track 2 assessments will be initiated at a CFA pond, which is saturated with oil and the other contains mercury. A transformer yard and two oil spill areas are contaminated with PCBs. A removal action to cleanup mercury contamination soil and other debris from the CFA Calcine Pit was completed in FY 1995. In FY 1995 the ROD for the CFA Landfills II and III remediation was signed, with capping as the remedy. Remedial Action will be initiated at the Landfills in FY96.

2153

1. Title and location of project:	INEL Environmental Restoration Project	2a. Project No. D-1.4.9
	Idaho Falls, Idaho	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

WAG 5, Power Burst Facility/Auxiliary Reactor Area (PBF/ARA):
WAG 5 is divided into 13 OUs. Potential contaminants are petroleum products, radionuclides, heavy metals, sanitary waste, brine, and rubble.

Several nuclear test reactors were operated in the PBF/ARA areas since the late 1950s. One reactor is still operational, but in a standby mode, while all others have been removed. The buildings which housed the reactors and support facilities have undergone partial or complete D&D. Elevated concentrations of radionuclides and chromium were present in the evaporation pond, and volatile organic compounds (VOCs) and radionuclides were present in the Corrosive Waste Sump, presenting primarily inhalation and ingestion risks. Also of concern is the ARA II Stationary Low Power Reactor (SL-1) Burial Ground, a 4.6 acre area where approximately 80 cubic feet of low level radioactively-contaminated debris from a damaged reactor was buried (OU 5-05), and the Boiling Water Reactor Experiment (BORAX) I reactor burial ground, a 0.5 acre area where the damaged test reactor was buried after an intentional fast excursion experiment (OU 6-01). These two sites are being evaluated under a combined RI/FS. Remedial design/remedial action activities will commence in FY 1996.

An Interim Action ROD was signed in September 1992 and "hot spots" were removed at the Corrosive Waste Sump and Evaporation Pond Area (OU 5-13). A "No Action" ROD was signed for the ARA I Chemical Evaporation Pond area (OU 5-10). The interim action cleanup at the Corrosive Waste Sump and Evaporation Pond (OU 5-13) was completed in FY 1995. Final Remedial Action for the SL-11 BORAX I reactor burial grounds will be implemented during FY96 and FY97, following submittal of ROD in FY96.

WAG 7, Radioactive Waste Management Complex (RWMC):
WAG 7 is a 154-acre site (divided into 14 OUs) that was used since the early 1950s as a disposal site for solid, low-level, radioactive waste generated by INEL operations and other off-site operations, and transuranic (TRU) waste shipped from Rocky Flats. Wastes were buried in unlined pits, trenches, pods and soil vault rows. The RWMC includes the TRU Storage Area and the Subsurface Disposal Area (SDA). Known or suspected contaminants include acids, TRU and non-TRU radionuclides from stored wastes, radioactive and nonradioactive hazardous materials, and organic and inorganic compounds, including VOCs in the vadose zone (the subsurface region beginning at the surface and extending down to the top of the Snake River Plain Aquifer).

Five Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) RODs are planned in the remediation of the RWMC: Pad A (OU 7-12), containing over 3,000 plywood boxes and 20,000 metal drums, stacked on an asphalt pad; the Organic Contamination of the Vadose Zone (OCVZ); TRU Pits and Trenches (which includes non-TRU Pits and Trenches); Pit 9 (110,000 cubic feet of TRU contaminated waste in drums, sludges, boxes, etc.) and the WAG 7 Comprehensive ROD. Pad A is a limited final Action that recontoured the existing soil cap and now monitors the site. Continue Pad A post remediation O&M. OCVZ will requires of a Vapor Vacuum Extraction process to remediate VOCs in unsaturated soil and rock beneath the RWMC.

2154

1. Title and location of project:	INEL Environmental Restoration Project Idaho Falls, Idaho	2a. Project No. D-1.4.9 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The Pit 9 Proof of Process (POP) Test was completed in FY 1994. The POP and Limited Production Test (LPT) are designed to confirm that the technology and expertise exists, in the private sector, to cost effectively remediate buried, mixed, and TRU contaminated waste at Pit 9, prior to initiation of full scale remediation. Outyear scope includes the completion of the Pit 9 LPT and initiation of full scale remedial action in accordance with the Interim Action ROD. Additional work includes completion of the SDA contaminated Pits and Trenches RI/FS, the OCVZ Remedial Action, and routine monitoring of RWMC environmental media sites.

WAG 10, Miscellaneous Sites:
WAG 10 includes regional Snake River Plain Aquifer concerns related to the INEL that cannot otherwise be addressed on a WAG-specific basis and other surface disposal sites and ponds identified at the INEL that are not included in specific areas. The WAG consists of 12 specifically identified and five generally identified sites divided into seven OUs. Specific sites currently recognized as part of the WAG include the Liquid Corrosive Chemical Disposal Area located between WAGs 6 and 7, the Organic Moderated Reactor Experiment located between WAGs 4 and 5, and areas containing unexploded ordnance.

Information from all other WAGs will support the WAG 10 Comprehensive RI/FS and ROD, which is the last enforceable milestone for a ROD under the INEL FFA/CO (FY 2001). The project includes investigation of ordnance sites contained within the boundaries of the former Naval Proving Grounds. Radionuclide contaminated soil assessment of OU 10-06 RI/FS will be completed. Work conducted under WAG 10 scope also includes the development of computer modelling codes for ground water flow and contaminant transport and the establishment of a geologic/hydrologic database in support of the Snake River Plain Aquifer RI/FS. In addition, WAG 10 includes the assessment of radionuclide soil contamination, for which RI/FS activity is underway.

D&D:
D&D activities are primarily concerned with the safe caretaking of surplus nuclear facilities until decontamination for reuse or complete removal has occurred. Criteria for declaring a facility "surplus" include designation as such by the programmatic sponsor, the absence of an identified programmatic use for the facility, and radiological contamination of the facility. The primary D&D activities at the INEL are driven by the former U.S. Department of Energy, Idaho Operations Office (DOE-ID) Surplus Facilities Management Program and Defense Facility Decommissioning Program schedules for cleaning up contaminated surplus facilities. However, a few individual units are also covered by the FFA/CO. The primary D&D activities at the INEL are driven by DOE Order 520.2A, Radioactive Waste Management, Chapter 5.

The units described below are on the DOE-ID Surplus Facilities List and are scheduled to be decommissioned in accordance with DOE, Federal, and State regulations. D&D planning for these excess facilities encompasses assignment of a priority to each facility; radiological, chemical, and physical characterization; and decision analysis that guides the selection of preferred D&D alternatives.

2155

1. Title and location of project:	INEL Environmental Restoration Project	2a. Project No. D-1.4.9
	Idaho Falls, Idaho	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Through FY 1994, 35 facilities had been decontaminated and dismantled including several that have been returned to a natural condition in that all evidence of the facility has been removed. The remainder have had all contamination removed and the useful parts of the facilities returned to further service. D&D sites are listed below:

Army Re-entry Vehicle Facility Site (ARVFS):
ARVFS sodium-potassium (NaK) Resource Conservation and Recovery Act (RCRA) storage unit consisted of an earth-covered bunker. The bunker contains four containers of RCRA-regulated mixed waste high-level radioactively contaminated NaK liquid metal. This liquid metal is the coolant removed from the Experimental Breeder Reactor I. Transport of the ARVFS NaK waste to Argonne West for treatment occurred during August 1995. Treatment and disposal of the NAK is planned for FY96.

ARA-I:
ARA-I was used as a support facility for the other ARA facilities until the U.S. Army Reactor Program was phased out in 1970. The facilities were used to support other INEL programs and facilities until 1987, and have been deactivated and remain idle. D&D activities include the total dismantlement of Buildings 626, 627, and Area 729 Hot Waste Tank containing TRU waste, the underground utilities, and septic system. D&D will be initiated during FY96.

ARA-II:
ARA-II housed the Stationary Low Power Reactor No. 1, which was destroyed in a reactor accident that occurred during maintenance operations in 1961. D&D of this facility includes the total dismantlement of the three buildings (converted into offices and welding shops), D&D of underground utilities, and the demolition of SL-1 Reactor equipment (completed in FY 1993). Final D&D completion is anticipated in FY96.

ARA-III:
ARA-III was used to test gas-cooled reactors until 1966. It was then used as a laboratory for component and instrument testing. D&D activities include removal of the exhaust stack, hot-waste tank and lines, concrete, and miscellaneous items in the reactor buildings. In addition, contaminated soil areas will be remediated as required by INEL release criteria. D&D will continue during FY96.

Materials Test Reactor (MTR):
MTR is located at the TRA complex. MTR was a 40 megawatt-light water reactor that operated between 1952 and 1970. The MTR area contains 15 major buildings and structures. Deactivation characterization was completed in 1982 and additional characterization and D&D activities will require several years to complete.

2156

1. Title and location of project:	INEL Environmental Restoration Project Idaho Falls, Idaho	2a. Project No. D-1.4.9 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Central Facilities Area Hot Laundry (CFA-669):
CFA-669 was formerly used as a laundry for radioactive and non-radioactive contaminated clothing. D&D activities were started in 1993 and was completed in early 1995 with issuances of final reports.

Engineering Test Reactor (ETR):
The ETR was a 175 Megawatt pressurized light water test reactor located in the TRA that operated between 1957 and 1982. Late in the life of the facility, the Sodium Loop Safety Facility was operated as part of the test program. The ETR contains 11 major buildings and structures. Deactivation characterization was completed in 1982 and additional characterization and D&D activities will require several years to complete.

BORAX-V:
BORAX-V housed four separate experimental reactors, BORAX II through V, that have been idle since 1964. Partial D&D was conducted in FY 1979, FY 1984, FY 1987, FY 1989, and FY 1992. D&D activities include the total dismantlement, removal, and disposal of equipment and demolition of the foundation of the Reactor Buildings to below grade. An entombment alternative with limited decontamination is currently under consideration.

Loss-of-Fluid Test (LOFT) Facility:
The mobile test assembly was a part of the LOFT Facilities Ancillary Equipment. The LOFT was used in the 1970s for loss-of-coolant simulated reactor accidents. This D&D activity will dispose of ancillary equipment remaining from the LOFT program.

TAN 607 Decontamination Shop:
This area began operations in 1957 and was shut down in 1987. D&D completed in 1994. Facility ready for re-use.

TAN TSF:
The Technical Support Facilities consist of buildings, structures, pits, and equipment used to support various INEL programs at TAN. The D&D cannot be started until TAN facilities have been fully characterized. TAN 606 calibration well D&D completed in 1994. Facility ready for re-use.

Test Train Assembly Facility (TTAF):
TTAF is the MTR-603 Fuel Storage Canal and was used in support of the Thermal Fuels Behavior Program to build and disassemble nuclear fuel tested at the Power Burst Facility Reactor.

1. Title and location of project:	INEL Environmental Restoration Project	2a. Project No. D-1.4.9
	Idaho Falls, Idaho	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The MTR-603 canal, consisting of contaminated hardware and equipment in a fuel storage canal, requires D&D.

Chemical Processing Plant (CPP)-709 and -734 Service Waste Monitoring Stations:
The D&D activity for CPP-709 and -734 monitoring stations will include decontamination followed by equipment removal and disposal as low-level waste and landfill waste.

ICPP is a complex for fuel processing, fluidized-bed waste solidification, and general research and development. The following facilities within ICPP complex are partially or completely inactive and require decommissioning:

CPP-603 Fuel Receipt and Storage Facility (FRSF). The D&D activity for the CPP-603 FRSF will be preceded by FS and options analysis to identify the D&D alternatives for the FRSF. Upon completion of an ongoing fuel transfer activity (estimated completion in FY 1999) the FRSF will be turned over to D&D.

- Stored Fuel Exterior Waste Tank (SFE-20) System/CPP-740. SFE-20/CPP-740 consists of a tank (full of radioactive waste, possible mixed hazardous wastes), tank vault, access tunnel, pump pit, CPP-642 compressor building, and associated piping and instruments. The CPP-740 area (liquid wastes of unknown composition have been found) consists of two slurry settling facilities, two dry wells, and a valve box manhole.

- CPP-640 Headend Processing Systems. The CPP-640 facility housed two headend processing systems (ROVER and ELECTROLYTIC) used to recover uranium from graphite matrix and stainless steel clad spent nuclear fuels. The now inactive processing systems are radiologically contaminated and are planned for D&D.

- CPP-631 Off-gas Cell and the CPP-709 and -734 Service Waste Monitoring Stations. The inactive CPP-631 building was an off-gas cell as part of a discontinued dissolution system process for uranium recovery from spent nuclear fuel. The now empty building is radiologically contaminated and is planned for decontamination and in-place demolition. The inactive CPP-709 and -734 buildings housed systems used to monitor a service waste stream before its discharge to an injection well and later to percolation ponds. These facilities are obsolete or have been replaced and are planned for D&D. D&D will initiate in FY96.

- CPP-601 Fuel Processing Complex. CPP-601 is still in use for flushing and clean-out of its dissolution process systems. The facility after flushing and clean-out, will contain radiological and hazardous contamination and is planned for a phased shutdown followed by D&D.

2158

1. Title and location of project:	INEL Environmental Restoration Project Idaho Falls, Idaho	2a. Project No. D-1.4.9 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

- CPP-633 Waste Calcining Facility. CPP-633 was originally constructed as a technology demonstration plant used to calcine radioactive high-level liquid waste. After its replacement by the New Waste Calcining Facility (CPP-659), the WCF calcination process has not operated since 1981. The facility contains radiological and hazardous contamination and is planned for D&D.

- High-Level Liquid Waste Tank Farm. The Tank Farm is currently in use but is scheduled for phaseout. The first phase will deactivate five of eleven underground storage tanks housed in concrete vaults. The second phase will inactivate the remaining tanks after FY 2000. Planning for the D&D of the inactive tank farm is in the pre-conceptual stage.

Program Management Support:
Program management support activities ensure that remedial actions and D&D activities are accomplished efficiently and effectively through managerial and financial control. All activities included in this level are driven by CERCLA, RCRA, DOE Orders and the FFA/CO for the INEL. The FFA/CO is an agreement among DOE, EPA Region X, and the State of Idaho Department of Health and Welfare remediate waste sites at the INEL in accordance with CERCLA.

Program management support scope includes configuration and records management, data management, sample management, quality and compliance assurance, strategic planning, system planning and control, community and stakeholder relations, waste stream tracking and INEL D&D program support.

Compliance Oversight:
Compliance oversight includes performance by the State of Idaho under the FFA/CO and provides for the Shoshone-Bannock Tribes to be among the organizations that assure the appropriate level of environmental compliance is performed within and near the INEL.

9. Method of Performance

The INEL program is implemented primarily by a Management and Operating (M&O) contractor, the United States Geological Service, a university research foundation, and other technical support contractors. The M&O contractor performs activities associated with program formulation, program execution, program evaluation,and quality assurance.

1.	Title and location of project:	Nevada Environmental Restoration Project Las Vegas, Nevada and Off-Site Locations	2a. Project No. D-1.4.1 2b. Operating Expense Funded

8. Project Description, Justification and Scope

The Nevada Operations Office (DOE-NV) has environmental restoration responsibilities for the Nevada Test Site (NTS), the Tonopah Test Range (TTR), and historical test areas on Nellis Air Force Range (NAFR), and other off-site areas in Nevada, Mississippi, Colorado, New Mexico, and Alaska. NTS covers approximately 1,350 square miles of desert. The closest major population center is Las Vegas, about 65 miles southeast of the NTS. The primary use of the NTS has been for below-ground nuclear tests and, historically, above-ground nuclear tests. Approximately 2500 individual contamination sites have been identified that include the below-ground and above-ground testing locations, ancillary waste disposal sites associated with testing activities, and areas where surficial soils were contaminated with Plutonium (Pu) as a result of safety tests of nuclear devices. DOE-NV considers Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), Resource Conservation and Recovery Act (RCRA), the Atomic Energy Act, and Nevada Hazardous Waste Act to be the primary regulatory drivers governing any remediation of the sites.

NTS:

NTS Remedial Actions:
There are three subtasks identified under NTS remedial actions: contaminated soils, underground test areas (UGTAs), and industrial sites.

2162

1. Title and location of project:	Nevada Environmental Restoration Project Las Vegas, Nevada and Off-Site Locations	2a. Project No. D-1.4.1 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Final remediation at the TTR, NTS and NAFR sites will be initiated after FY 2001. The actual scope and schedule for the Remedial Investigation/Feasibility Study (RI/FS) and remediation of plutonium-contaminated areas will be governed by a compliance agreement that is being negotiated, and by the Environmental Protection Agency (EPA) cleanup standards that are under development. Treatability studies for the plutonium (Pu) contaminated soils have been completed. The initiation of this activity is scheduled to coincide with the issuance of Record of Decisions (ROD), to allow for the phased remediation of soils at NAFR, TTR, and NTS. In baselining this activity, it was assumed that up to 30,000 acres of soils are contaminated above a yet-to-be-determined regulatory standard and could require remediation. Failure to perform the remediation would likely result in a violation of the Federal Facility Agreement (FFA) and Consent Order (CO).

The contaminated soils provide for execution of an RI/FS and the remediation of the associated sites, as required, to achieve an appropriate level of risk reduction. The RI/FS will focus on determining the potential risk associated with the resuspension of the contaminated soils, which is believed to pose the greatest risk. At least one and perhaps several sites will be cleaned up as interim actions during the time required to complete a site-wide RI/FS. The RI/FS work will characterize each site, determine the potential for contamination, and identify and evaluate the Applicable or Relevant and Appropriate Requirements, that will guide remediation. Scoping of the work effort to be performed during the planned RI/FS has resulted in a number of additional findings. These findings include the identification of additional areas of potential contamination on the NTS that should be included within this activity, the identification of preliminary risk-based exposure limits that suggest that the area of concern may be greater than 30,000 acres for Pu-contaminated soils, and the identification of other radionuclides that should be addressed as part of this activity. As a consequence of these and other findings, the scope of this activity has been modified to address all areas of contaminated soils on the NTS regardless of their origin, including soils contaminated through historic cratering experiments, soils contaminated by the venting of underground nuclear tests to the atmosphere, and soils contaminated with radionuclides other than Pu. RI/FS activities at the TTR, NTS, and NAFR sites began in FY 1992.

For the UGTAs, assessment activities will be completed in FY 1996 and will continue to address all underground test locations at the NTS and potential contamination of ground water from the testing. Assessment activities will evaluate the potential nuclear sources and migration in the saturated zone by completing a regional three-dimensional ground water flow model and a one-dimensional solute transport model. The results of the modeling will be input data for performing a risk assessment. The risk assessment will be based on various land use scenarios for off-site receptors in order to determine risk to these receptors. The modeling and risk assessment work will be documented in a report that will be submitted to all stakeholders.

Assessment activities in the field include the completion of the drilling demonstration project. This effort evaluates the dual-tube drilling techniques for use at the NTS. The unique subsurface conditions at the NTS preclude typical field methodologies employed at other facilities and, therefore, require specialized techniques.

2163

1. Title and location of project:	Nevada Environmental Restoration Project Las Vegas, Nevada and Off-Site Locations	2a. Project No. D-1.4.1 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Remediation activities will include the design and installation of ground water monitoring well networks. The design will be based on the results of the model for identification of ground water flow paths and contaminant transport and local ground water and geological data for seven areas of historic underground testing on NTS. Monitoring wells that are installed are sampled for compliance as part of interim RODs that will be prepared for the historic testing areas. The data will also be used to evaluate the effectiveness of the monitoring system in meeting the interim ROD requirements. Geologic and hydrologic data from the monitoring well installation will be evaluated to more precisely estimate current and future contaminant migration.

Remediation activities will begin in FY 1996 and will focus on the seven individual testing areas at the NTS. The regional modeling conducted as part of assessment activities will provide the framework needed for the compilation of complex local scale (testing area) models. Near field wells will be installed immediately down-gradient of the testing areas that will serve as monitoring points, but will also provide information on local scale hydrogeology to better design the rest of the monitoring networks for the test areas. Interim RODs will be prepared for the ground water monitoring to meet state and stakeholder concerns.

The industrial sites include the assessment and remediation of "like" waste units such as tunnel muck piles, tunnel ponds, sumps and injection wells, inactive tanks, leachfields, contaminated waste sites, atmospheric test debris, and other miscellaneous sites. The waste units are the result or by-product of past testing and support activities at the NTS. DOE/NV is required to maintain an inventory of all known and potential Corrective Action Units (CAUs) in accordance with the RCRA Part B Permit adopted with the State of Nevada Division of Environmental Protection (NDEP) in 1995. The Permit requires DOE to meet annually with NDEP and prioritize CAUs for corrective action investigations, and subsequent corrective action. Further, the FFA and CO will specify milestones for cleanups, with penalties identified for non-conformance.

Included in this activity are development and implementation of characterization plans, closure plans, post-closure care plans, and management of wastes generated by characterization and closure activities. The ER Sites Inventory includes data on all known DOE/NV ER sites to determine restoration responsibilities as required by the RCRA Part B Permit for tracking CAU status. Data on sites are validated through photographic monitoring and through field verification, including surveying using global positioning system techniques. New sites may be identified through review of archived literature, photographs, and site visits.

Site characterization is generally accomplished in phases, and may include researching process knowledge, planning the field effort, developing data quality objectives, and gathering preliminary data. Intrusive techniques, such as drilling and sampling, may be employed if necessary to determine whether contaminants are present and if they have migrated. Characterization may continue to define more fully the vertical and lateral extent of contamination.

2164

1.	Title and location of project:	Nevada Environmental Restoration Project Las Vegas, Nevada and Off-Site Locations	2a. Project No. D-1.4.1 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

When characterization is complete, closure plans are developed. Closure may be in the form of "clean closure." i.e., excavation or removal of all contamination, and/or remediation of the media to achieve pre-determined clean-up levels; closure-in-place, i.e., leaving the waste in place, usually stabilized, solidified, or covered with an engineered cap; a combination of removal/remediation and closure-in-place; or no action may be appropriate.

Post-closure monitoring includes activities that must take place to comply with RCRA Post-Closure Care Permit Applications submitted to the State of Nevada as part of closure activities, typically for waste units which have been closed-in-place. Post-Closure care activities consist of collecting periodic measurements and/or samples from monitoring wells, effluent streams, etc., as stipulated in each unit's post-closure care permit. Condition inspection and maintenance of any remedial systems such as caps or active systems is included as applicable. Sample analysis and preparation of a report for each monitoring period is also included.

D&D:
The D&D activity involves management and disposition of facilities that have no planned future use and which are contaminated from DOE mission-related activities. This activity includes assessment, which involves characterization of facilities, and design and preparation of D&D plans; and remediation, which involves implementation of the plans. This activity includes eight multi-structure facilities at the NTS. However, more process-contaminated facilities may be identified and determined to have no planned future use. Such facilities will be identified and managed through the Surplus Facility Inventory Assessment. "Accepted" facilities will be transitioned for eventual D&D. The principle driver for D&D is DOE Order 5820.2A, but DOE and EPA recently agreed that CERCLA applied to D&D, and the D&D facilities are covered by the FFA and CO. Target funding levels essentially preclude D&D activities on any but the smaller facilities.

Characterization will be conducted at eight multi-structure facilities. This includes periodic surveillance and maintenance before decommissioning takes place, characterization planning, sample collection and analysis, data management, data evaluation, risk/dose assessment, and assessment report preparation. A design will be prepared which specifies construction/demolition-type activities necessary for remediation.

Remediation will be conducted after completion of design activities. Remediation activities may involve dismantlement, demolition, encapsulation, and/or entombment to achieve the designated disposition alternative for each facility.

2165

1. Title and location of project:	Nevada Environmental Restoration Project Las Vegas, Nevada and Off-Site Locations	2a. Project No. D-1.4.1 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Off-Site:
There are five subtasks for remedial actions off-site from NTS. These locations are in Alaska, Colorado, Mississippi, Nevada, and New Mexico.

The off-site remedial action activity will define the magnitude and extent of contamination and the associated risks. This process will include the characterization of the physical setting of the testing area, the definition of the occurrence of contamination, and the identification of the pathways by which contamination might reach a potential receptor. The risks to receptors will also be defined through procedures identified by the EPA. Should risks be found to exceed acceptable limits, the requirements for risk reduction through remediation or other actions will be established. The regulatory drivers are CERCLA/SARA Title I, Section 120, 40 CFR 300.68, and 40 CFR 300.70. In addition, activities for the two off-sites in Nevada, the Project Shoal Area and the Central Nevada Test Area, are covered by the FFA and CO. If unfunded, noncompliance with the terms and conditions of the existing or anticipated AIPs and agreement is likely to occur.

Alaska remedial action activities have been initiated in FY 1995 through rescoring of the site through the EPAs Hazard Ranking System and the development of a work plan. During the rescoring, additional information concerning the regulatory authority and the potential need for an RI/FS of the site will be determined. Assessment of the site will be completed in FY 1998. If necessary, remediation activities will be initiated in FY 1998 and continue until FY 2001.

Remedial action efforts for the Colorado site at Rulison will be initiated in FY 1995 through the development of preliminary site characterization plans relying largely on existing data on the site and scoping of the Rulison site. Assessment activities will be completed in FY 1999. Interim action remedial activities are underway in FY 1995 with remediation of the sediment in the drilling effluent pond at Rulison. Assessment activities at the Rio Blanco site will begin in FY 1995 and be completed in FY 2000. Remedial activities will begin in FY 2000 if required, and will finish in FY 2000.

RI/FS activities for the Salmon Site in Mississippi will be completed in FY 1996. If required, remediation activities will begin in FY 1998 and will be completed in FY 1999. If unfunded, a final Administrative Order from the State regulatory authority is anticipated.

Assessment activities at the Nevada off-site location of the Central Nevada Test Area (CNTA) were initiated in FY 1994. During the scoping, additional information concerning the regulatory authority and the potential need for information concerning the need for an RI/FS work plan for the CNTA was prepared. The remediation activities at the CNTA will begin in FY 1996 with the closure of three drilling mudpits. Preparation of the preliminary characterization report for Shoal and CNTA began in FY 1995. Both Shoal and CNTA are scheduled to be closed by FY 1998.

New Mexico remedial action activities at the Gnome-Coach Test Site and the Gasbuggy Site will be completed in FY 1999. If necessary, remediation of the Gnome-Coach site will begin in FY 1999. Preparation of the preliminary characterization report for the Gnome-Coach and Gasbuggy Sites began in FY 1995.

2166

1. Title and location of project:	Nevada Environmental Restoration Project Las Vegas, Nevada and Off-Site Locations	2a. Project No. D-1.4.1 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

DOE-NV's primary goals are to achieve full compliance with all environmental laws and regulations and to control further releases. An additional goal is to attain, within 30 years, an acceptable cleanup of hazardous substances, pollutants, and contaminants, which at a minimum insures protection of human health and the environment. To achieve these goals, DOE-NV will bring all current operations into full compliance with applicable regulatory requirements, assess and clean up inactive waste sites and facilities, continue safe and effective waste management operations that emphasize systematic minimization of waste generation, and coordinate a research and development program to develop new technologies that yield permanent remedial actions at lower costs. The State of Nevada will be involved via a FFA and CO with DOE. DOE-NV has already increased its focus on public participation through the development and implementation of an EM Public Participation Plan and the establishment of a Community Advisory Board.

9. Method of Performance

A performance-based management contractor, with a cost plus award fee contract, will perform waste management and remediation activities. An environmental support technical cost plus fixed fee contract was signed in FY 1992 to perform characterization activities for DOE-NV Environmental Restoration Major Project.

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 136,318	$ 31,502	$ 45,400	$ 51,095	$ 187,920	$ 452,235
2. Decontamination & Dismantlement	1,193	693	520	1,000	4,000	7,406
3. Long-term S&M	0	0	0	0	0	0
4. Landlord	0	0	0	0	0	0
5. Compliance Oversight	0	2,348	1,971	1,097	4,588	10,004
b. Contingency	0	0	0	0	0	0
Total	$ 137,511	$ 34,543	$47,891	$ 53,192	$ 196,508	$ 469,645

1.	Title and location of project:	Nevada Environmental Restoration Project Las Vegas, Nevada and Off-Site Locations	2a. Project No. D-1.4.1 2b. Operating Expense Funded

11. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.
